UNIVERSITY OF ILLINOIS

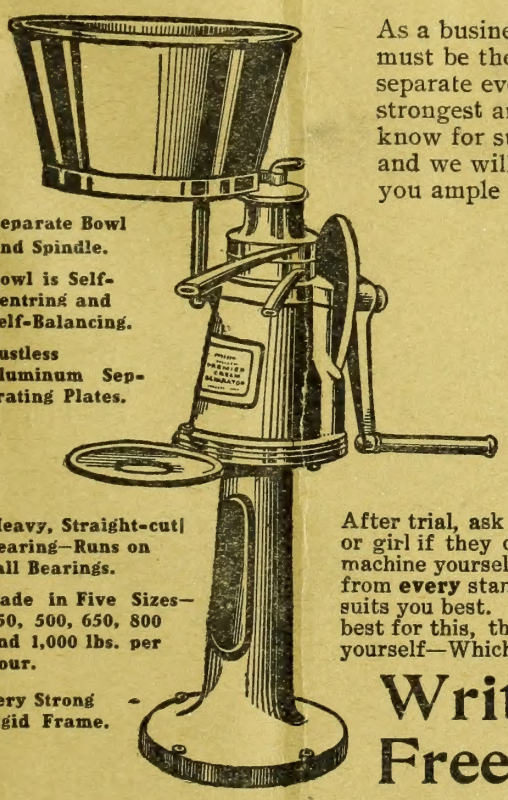
The MARITIME FARMER AND CO-OPERATIVE DAIRYMAN

Published twice-a-month in the Interests of the Farmers of the Maritime Provinces of Canada

Vol. 16. SUSSEX, N. B., OCTOBER 11, 1910 No. 1

You Needn't Pay For This Cream Separator Until It Has Paid For Itself.

And You Needn't Buy It Until You Have Tried It On Your Own Farm.



Separate Bowl and Spindle.

Bowl is Self-Centring and Self-Balancing.

Rustless Aluminum Separating Plates.

Heavy, Straight-cut Gearing—Runs on Ball Bearings.

Made in Five Sizes—350, 500, 650, 800 and 1,000 lbs. per hour.

Very Strong Rigid Frame.

As a business farmer these generous terms ought to convince you that the Premier Cream Separator must be the **Real** best on the market. We could tell you in this advertisement that the Premier will separate every drop of cream from milk, that it is the easiest machine to turn, the easiest to clean, the strongest and most durable, but every other manufacturer is saying the same thing, so you wouldn't know for sure who was telling the truth. So this is our offer. Just send us your name and address and we will arrange with our nearest agent to place you a Premier Separator on trial. This will give you ample opportunity to test the Premier in your own way.

PREMIER CREAM SEPARATOR.

After trial, ask your wife if she can clean the separator thoroughly within three or four minutes, ask your little boy or girl if they could turn the handle for half-an-hour at a stretch without tiring, examine every part of the whole machine yourself thoroughly, then if you feel perfectly satisfied that the Premier is the finest separator in the world from **every** standpoint, you can arrange with our dealer to buy the machine either for cash or on time, whichever way suits you best. A lot of Cream Separator firms are shouting themselves hoarse telling you that their machine is the best for this, that and the other reason—We prefer to leave the Premier entirely to you to judge of its merits for yourself—Which way do you prefer ?

Write For Free Book

If you are not familiar with the general construction of Cream Separators, this is not the place or time to go into technical details of the Premier. We have prepared a very fine illustrated booklet which describes the Premier in plain, simple language. Send us your name and address to-day and we will mail you one of these booklets **Free:** then you can learn in the quiet of your home all about the Premier, and why we can afford to make such liberal terms. This is a business offer—for a business farmer. Write us to-day.

Want Quality!

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the **"Ideal"** is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of sealing directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinder head, so that when the valves become worn, the valve cage and valve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn, you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer.

"Ideal" Gas and Gasoline Engines are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price.

Her Baby Nearly Died.

WAS TAKEN SICK WITH Dysentery.

Mrs. Chas. Farrell, Oakland, Man., writes:—"My dear baby was taken sick last fall, and we got the doctor and he said she had dysentery. She nearly died with it, but two or three doses of Dr. Fowler's Extract of Wild Strawberry completely cured her.

"My two little boys got a bad case of diarrhoea and two doses made a wonderful change and they were completely cured also. I would not be without such a grand medicine as Dr. Fowler's Extract of Wild Strawberry if it were twice the price, as I consider it a wonderful medicine, and I cannot recommend it too highly."

Dr. Fowler's Extract of Wild Strawberry has been on the market for over sixty-five years, so you are not experimenting when you use this old and tried remedy.

Do not accept any of the many substitutes for this sterling medicine, but ask for Dr. Fowler's and insist on getting what you ask for. Price 35 cents.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

MUMFORD'S BUILDING, ARGYLE ST.,

Halifax, N. S.

Personal attention given to sales of Butter Eggs Hogs Beef, Poultry, Fruit, Vegetables etc., Consignments solicited. Proceeds of sale remitted promptly, Halifax prices sent on application TELEPHONE 1905.

Stoppage of the Teat.

A very common trouble in the ordinary dairy is to find an animal with the point of the teat closed, either due to a bruise of the teat itself or to infection of the milk duct which causes a little scab to form over the point of the teat and unless this is properly handled with care and cleanliness the infection is apt to cause a loss of the entire quarter.

The proper manner in which to handle and treat such cases is to thoroughly wash the teat in an antiseptic solution, then dip a teat plug into a healing ointment and insert it into the point of the teat, allowing same to remain from one milking to another. In this manner closure of the point of the teats can be overcome in a very simple and satisfactory way.

Never use a milking tube if it can possibly be avoided as there is much danger of infecting the entire quarter by the use of the tube.—Dr. David Roberts.

The Golden Hoof.

Fix a high ideal and breed toward it by selecting the best rams.

Whether breeding for pleasure or profit, your desire will be more fully met if your flock shows superior quality.

The poorly tilled farm with a behind-the-times owner stands more in need of successful sheep breeding than all the dogs in the country.

If more farmers would stock their farms with high-class sheep the hired help problem would be solved. One good, live man will handle a large flock.

No man should go into sheep raising extensively unless he has a woven wire fence around his yards and pastures. The old barb wire with wool hanging to it is a relic of the past [illegible] sheep farm.

Draining Tiles Wanted.

R. Y. Tracey writes, I have started draining by open ditches and mean to use tiles for the laterals if I can get them at a reasonable price. I never see tiles advertised in the Maritime Farmer. Are there tile works in the Maritime Provinces? Can you tell me of any one from whom I can buy tiles? I've had considerable experience in tile draining in the west of Scotland years ago, I know its value.

In reply to the foregoing query, which appeared in our issue of September 6th, we have the following replies.

T. D. Bates, Middle Stewiacke, sends the address of The Elmsdale Brick & Tile Co., Elmsdale, Hants Co., N. S.

The Middleton Clay Working Co., Ltd., of Middleton, N. S., also forwarded their own address.

SEND US 75c. Receive by return mail, post paid, this beautiful little dress. It is made with a little waist joined with a wide belt to a full pleated skirt. The side of the waist and belt are trimmed with fancy pointed strappings inlaid with dark red mercerized sateen. Fancy trimmed breast pocket and cuffs. The whole dress is elaborately trimmed with brass buttons. The material is soft warm flannelette suitable for winter wear in dark red plaid pattern. It comes in ages from 4 to 12. It is worth double what we ask. To introduce our childrens dresses we make an advertisement of this number and send it by return mail for only 75c and 10c for postage. Order to-day. Granite Harvester Oil

For Reapers, Threshers, Plows, Harrows

Insures better work from the new machine and lengthens the life of the old. Wherever bearings are loose or boxes worn it takes up the play and acts like a cushion. Changes of weather do not affect it.

Gasolene and Kerosene Engines

Standard Gas Engine Oil is the only oil you need. It provides perfect lubrication under high temperatures without appreciable carbon deposits on rings or cylinders, and is equally good for the external bearings.

Steam Traction Engines and Steam Plants

Capitol Cylinder Oil delivers more power, and makes the engine run better and longer with less wear and tear, because its friction-reducing properties are exactly fitted to the requirements of steam traction engines and steam plants.

Traction Engines, Wagons, Etc.

Mica Axle Grease makes the wheel as nearly frictionless as possible and reduces the wear on axle and box. It ends axle troubles, saves energy in the horse, and when used on axles of traction engines economizes fuel and power.

Every dealer everywhere. If not at yours, write for descriptive circulars to

N. S. PROVINCIAL EXHIBITION.

THE last exhibition in the series of Maritime Provincial fairs was held in Halifax, N. S., on Septs Honor, the Late Lieutenant Governor Fraser, which cast a gloom over the city and province, the usual formal opening ceremonies were dispensed with this year.

On the opening day the weather man sent rather threatening weather, but the attendance was fairly good. The second and third days of the fair brought magnificent, warm, fall weather, which gave the live stock judges every possible chance to spend as much time as they chose, in reviewing the various sections of each class. The fourth day again brought threatening weather, during the morning hours and in the late hours of the forenoon and during the afternoon the flood gates were opened and rain came down in torrents. The second week of the fair brought equinoctial gales of high, cold winds that did not tend to the comfort of the exhibition visitors and made them feel like expressing the sentiment "Home Sweet home for mine."

On the morning of the opening day the following statement which contains more truth than fiction, by Mr. Justice Longley, President of the Exhibition, appeared in the Halifax papers:—

"For several reasons there will be no formal opening of the Exhibition this year. This duty has usually been performed by His Honor the Lieut.-Governor, whose death yesterday will occasion profound regret throughout the province. An invitation was extended to Mr. Theodore Roosevelt, who courteously urged his many engagements as an excuse for declining. General Sir Robert Baden-Powell was also invited, but unfortunately could not adjust his engagements to suit our dates. Judicial duties, will, I fear, prevent my presence in the city on the opening day.

"The Exhibition has been so long in existence, and has become such a regular institution, that little can be said that is novel. During the fourteen years that Exhibitions have have been held it can be safely said that there has been steady and continual progress in the number and character of exhibits, in the quality of our agricultural productions and in the status of our industrial developments. The number of exhibits this year will surpass any previous year, except, perhaps, the one in which the Dominion Exhibition was held.

"The provincial exhibition fourteen years ago was located permanently at Halifax by act of the legislature. Taking all things into consideration, Halifax is unquestionably the most desirable place for a provincial show, but there are persons in other parts of the province who did not at first concur in this view and the commission and friends of the provincial exhibition have had to contend more or less against these prejudices and secure universal recognition of the propriety of having the provincial exhibition at the provincial capital. I would like, therefore, to say a few words to the people of Halifax in respect to their interest in and obligation to this Exhibition.

"I am not seeking to complain of any want of sympathy on the part of the members of the city council, the board of trade or the leading business men of the city, who have always recognized the enormous advantages which the holding of an annual show in this city afforded, but I, and other members of the commission, have sometimes felt that there was a lack of zeal on the part of the citizens generally. To make our efforts successful, and to ensure general appreciation of the advantages of Halifax it is necessary that the commission should have the cordial and unstinted support of all classes in the city. I do not think that the citizens of Halifax have exhibited as warm and universal interest in the exhibition as those in St. John in its show. Halifax has now one of the best equipped plants in the Dominion of Canada. We have between thirty and forty acres of ground, upn which stand buildings which cost over $140,000. Those managing the exhibition at St. John have hitherto been limited to a comparatively small area, and with building facilities which cost considerably less than ours. But they have always possessed an asset which has to a large extent offset their inferiority of location and facilities. They have had the undivided interest and support of all classes of citizens. On the opening day almost every leading man of every rank in life is present to give his approbation and support.

"I sometimes think that even the merchants of the city sometimes fail to appreciate their opportunities of showing their zeal for the exhibition If we are afflicted with stormy weather, it is not uncommon to shrug the shoulders and say "Regular exhibition weather," instead of exhibiting the sorrow and regret which any one should instinctively feel. I not infrequently encounter citizens who intimate that the commission should hold the exhibition only once in two years, forgetting evidently that an annual exhibition is at present fixed by law, and forgetting also that the chief object of a provincial exhibition was annual shows at which there could be a regular grade of development in the live stock departments from the calf to the full grown animal. Considering that at each exhibition at least $100,000, and perhaps much more, is left in the city as the immediate result of it, I cannot very well appreciate why any citizens should want the exhibition semi-annually.

"In the best social circles of Halifax I constantly find evidence of utmost indifference and many of our best people, including ladies, take pride in intimating that they never attend. It is not so in the city of St. John. On the opening day, as on all other occasions, the ladies of St John are in full force and in their best clothes and ill would fare any person who cast a sneer at their exhibition. We have a right to expect the same generous and enthusiastic support from the citizens of Halifax, and if we fail to receive it, it must arise from a disposition that will seriously impede the industrial and commercial development of the city.

I notice that a Boosters organization has been formed in the city, and I earnestly wish it god speed in its efforts to wake up the people of Halifax to the necessity of standing shoulder to shoulder in supporting every institution and endeavor with which the interest of the city is identified."

WORK HORSE PARADE

on the opening day was a success almost beyond even the expectation of the most enthusiastic of its promoters who worked so hard to make it a go. It brought out over a mile of teams and opened the eyes of people who thought Halifax could not turn out a commendable work horse parade. In fact most citizens had their eyes opened by the display, for not many anticipated such a fine large display of bright wagons and good horseflesh used every day in the trade of the city. The teams participating were assembled in the field enclosed by the track and when all was ready the trotting races were suspended and the work horses, headed by fire department teams, paraded round the track.

When the leading team was back to the starting point and there was half a mile of teams strung round the track, there were still just as many, or more, teams inside the enclosure yet to come, and they had to line up in double tier and even in two tiers, as the track would hardly take them all in. However, they managed to move around in two tiers and then they wound back into the enclosure where the ribbons were attached to the winning turnouts.

There were handsome and most creditable turnouts in all departments and time and again the spectators broke into applause as teams which particularly struck their fancy passed by and Rafuse's turnout with the wagon neatly laden with vegetables shared largely in the applause.

There was such keen competition among milk teams for the street rug offered by Kelly's Limited, that the judges had to work overtime at it. A. E. Boutilier carried off the blanket. The display was an evidence of what a good hustling committee can do when they get ready. The committeemen themselves admitted they were amateurs in this particular line, but felt that now the good work is started and a year's experience has been had, improvements can be made which will lead to even more interesting parades in future years.

The judges were H. C. Merwin, President of the Boston Work Horse Parade Association; E. C. H. Tisdale, of Beavertown, Ont., and A. W. Harrington, of Boston, and they thought the display a most creditable one. Messrs Merwin and Tisdale, speaking after the parade, suggested that if there were more judges, say two for each class, the parade and judging could be all done in an hour or two. Mr. Tisdale thought an hour but Mr. Merwin thought the horses should all be seen in motion. Several teams were disqualified on account of the horses showing whip marks and being in poar flesh. Mr. Merwin said that in the Boston parade they make a feature of old horses and to qualify for that class a horse must have worked for at least ten years in theownership entering him. The parade has a tendency to have horses and teams in good condition, as owners and drivers take a pride in winning at the parade and have it always in view.

Mr. Tisdale said that in Ontario they give one first, second and third, medals and ribbons, but every driver of a competing team is handed one dollar.

Both gentlemen thought Halifax's first attempt at a work horse parade was a highly successful one, and now that a start has been made improvement in appearance of working teams will be noticeable from year to year.

Much credit is due the citizens' committee for the success of the parade and it will again be a feature at next year's exhibition.

Some of our best horsemen were heard to remark, that they did not know that so many good horses were owned in Halifax.

IN THE BUILDINGS

It was remarked by many visitors, who are regular attendants at the

fair, that they had never before seen the exhibition in such up-to-date shape on the opening day. All the booths in the main building, the Annex, and in Machinery Hall, were all completed, with one or two exceptions, before the fair was thrown open to the public. Changes were made in the allotments of space in some of the buildings and the exhibits made by the most progressive Halifax and other firms were far more attractive than for some time.

The south end of the Annex, was devoted to a "Made in Halifax" exhibition gotten up by a number of firms interested in the "Booster movement," which [illegible] ing and instructive display.

This year Machinery Hall was changed to the Transportation Building and all the space was devoted to a transportation display of autos, carriages, motor boats and a fine display of road making implements. The Provincial Government had a large space in the centre of the building which was devoted to road making machinery and a fine display of maps, etc., showing the construction of the different kinds of road beds. They also had a display of heavy and light road making machinery on the grounds, and had a section of road bed built with culverts, showing the work performed by their different machines and the method employed in building roads with various materials.

The Sydeney Pressed Brick Co., had magnificent displays of their various manufacturers. Ranged in cases around the walls were samples of the various minerals found in Nova Scotia, that gave the visitor a comprehensive insight into the mineral wealth of the Province.

THE ART DEPARTMENT

contained the finest exhibition along those lines ever held in Halifax. It included many important pictures and etchings, by noted artists, that set an ideal for the amateurs, who made such a good showing in their class.

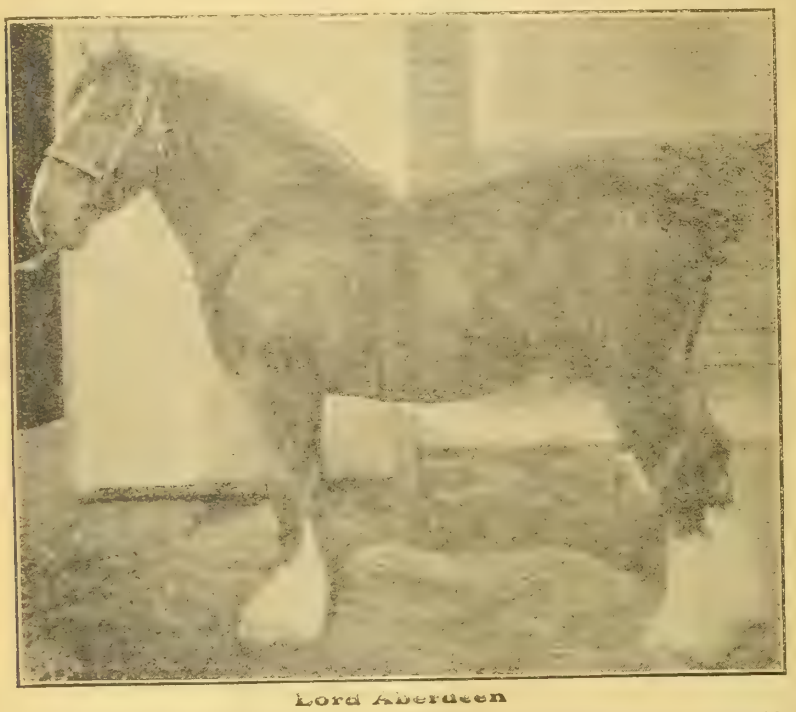
THE EDUCATIONAL EXHIBIT.

was the fullest and best in the history of our schools. Nearly all of the four walls of the gallery, in the maoufactureres' building, was devoted to exhibits of Public Schools, Kindergartens, Supervised Play Grounds, Provincial Normal School, and the Department of Technical Education. The exhibits deserved careful examination. In the Technical School dept. some of the most creditable of all the work was, so the placard announced, "done by apprentices and artisans in the evening technical classes."

AGRICULTURAL HALL

contained a magnificent display of seeds. It was splendidly arranged and attracted much attention.

The Nova Scotia Hospital, Dartmouth, also had a very fine exhibit,



Lord Aberdeen

Champion Clydesdale Stallion at the Dominion Exhibition, St. John, N. B., 1910. Owned by T. B. McAuley, Hudson Heights, Quebec.

IN THE FISHERIES BUILDING

the complete number of entries was not so large as in the year of the Dominion exhibition.

There was a fairly good exhibit of the great staples—cod, herring and lobsters—at the exhibition, but not on the liberal scale one might expect at such a large and important centre of the fishery trade in the Dominion.

The display of models of fishing vessels and marine architecture, etc., with the collection of old time windjammers contrasted with splendid modern steam vessels, and was the best shown since the opening of this department.

A unique display of native sea plants, ferns, shells, etc., attracted much attention from visitors to the fisheries building.

THE DEPARTMENT OF MINES

was rearranged this year and presented a very attractive appearance. The Dominion Iron and Steel Co., The Nova Scotia Steel and Coal Co., The Londonderry Iron Mining Co., The Sydney Cement Co., and

The collection was a very large one and tne products shown were exceptionally good.

There were also three very fine garden collections. These embraced various products of the soil, and were equal to the best ever shown at Halifax. One was from Halifax, one from Annapolis and one from Hants.

S. J. Moore, of the Seed Division, judged the grain and seed sections, and G. B. McGill, of Middleton, N. S., placed the awards in the Field Roots and Garden Vegetable Classes.

Col. S. Spurr, Melvern Square, Annapolis County, had the best colgrain and root crops. The exhibits were arranged to good advantage, and the show was an attractive one. F. R. Trotter, of Antigonish, was the superintendent of this department, and F. W. Webster, of Cambridge, Kings, was his assistant.

The display of grain was larger and better than other years. There were exhibits from all over the Province, and some from Prince Edward Island

The exhibit of potatoes was about an average, some splendid Nova Scotia and P. E. Island tubers being shown. Cape Breton was also to the fore with some good exhibits.

The display of pumpkins and squash was the best for years, and turnips and mangolds were fully up to the average.

A magnificent display was made of the products of the Experimental Farm at Nappan. This exhibit embraced almost everything in the line of roots, vegetables, grasses and lection of field roots followed in second and third places by B. F. Chesley and Thos. Aylward. Mr. Chesley also won second money on collection of garden vegetables. Geo. W. Keillor, Dartmouth, captured the first award in the latter section and E. E. McKinlay, of Halifax captured the third place money.

HONEY AND APIARY PRODUCTS

had only three exhibitors, viz: Julia Corbett, Amherst Point, N. S.; Chas. Pears, Dutch Village, N. S.; and Mrs. G. H. Wheelock, Torbrook, N. S. Miss Corbitt captured all the first prizes. Mr. R. Robertson, Superintendent of the Experimental Farm, Nappan, N. S., placed the awards.

DAIRY PRODUCTS.

Mr. Harvey Mitchell, of the Dairy Department, Ottawa, placed the awards in the dairy products class. There was a good showing of cheese made by Mr. Geo. Vinten's various factories in Antigonish Co., N. S.; W. W. Webster, Blue Sea Corner, N. S.; Mrs. E. C. Young, Bridgetown, N. S., and by a large number of Prince Edward Island makers. There was strong competition in the butter classes and every dollar offered by the association was captured. The quality was excellent and showed that both cheese and butter makers are paying a great deal of attention to putting up good quality in attractive packages.

FRUIT SHOW AT THE HALIFAX PROVINCIAL

One might suppose from the report of a small apple crop in the Annapolis valley that the display at the exhibition would be very slim. On the contrary there was a large show of fine fruit. The display of apples was remarkably fair in size color and uniformity. Plums and pears were fully up to ordinary, while some peaches and grapes were shown in collections and plates. The various county collections as usual were well represented. Halifax had two good collections. Although missing G. N. McKean, of Gays River, who has removed to Hantsport. Lunenburg, Digby and Yarmouth had two each. B. F. Chesley, Bridgetown, as usual represented Annapolis, this year alone as E. C. Young and T. E. Smith, old veterans seem to have retired from the field. Annapolis seems to be lagging in ex-

Gombault's Caustic Balsam

The Worlds Greatest and Surest Veterinary Remedy

HAS IMITATORS BUT NO COMPETITORS!

SAFE, SPEEDY AND POSITIVE.

Supersedes All Cautery or Firing. Invaluable as a CURE for

BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

hibitors and there is an excellent opening for some young blood to get in the work. S. Harrison, of Maccan, puts out a nice collection from Cumberland winning first. From Colchester there were two collections staged by Geo. Anderson, of New Annan. Colchester seems from appearance of the collection to be well up to the Annapolis Valley in fruit growing. The Provincial Experimental orchard is partly responsible for this improvement. Antigonish is showing better yearly, three collections are credited to this county for 1910. Pictou, Guysboro, and all Cape Breton are unrepresented, the hard season affecting them severely. Hants showed three fine collections. Thos. Aylward wins first, gaining over Mrs. Sangster by a few points. Mr. Aylward also won for Hants the coveted sweepstakes prize for the best collection of fruits and berries from any county. The tide of victory seems to be working Eastward. Years ago, Annapolis was the only county, then Kings carried the banner for many years, now the star of Hants seems in the ascendant. The sweepstakes collection was a splendid show of fruit, well grown, well selected, well displayed with the clear color characteristic of Hants County stuff.

The Furness Withy Co., whose steamships carry the bulk of our apples to London and Liverpool were out this season with a magnificent solid silver tea service for the best collection of ten commercial varieties of apples, five plates of each sort. Three competitors were in the field, H. O. Harris, of Canning; L. E. Healey, of Port Williams and G. N. Banks, of Berwick. Any of them were well worthy of the trophy, but first place was given to Mr. Healey, who showed a collection of 250 apples seldom equalled for uniformity, color and perfection. This splendid service made by M. S. Brown & Co., of Halifax, and was on exhibition, and must be won three times before becoming the property and G. N. Banks were foremost of the winner. If we mistake not there will be a keen competition for it in coming years. In collections of commercial apples Seaview Farm among prize winners. Mr. Banks is an amateur in exhibition work, if he stays in the list, with experience in selecting he will be a prize winner.

In pears, and they made a goodly show, Seaview Farm, A. C. Johnson and H. D. Johnson seemed to be the most frequent winners.

Plums were out in abundance and fine quality. Andrew Johnson and Seaview Farm taking many prizes each.

THE LIVE STOCK JUDGES

were as follows:—

Horses—E. C. H. Tisdale, Beaverton, Ontario.

Beef Cattle, Sheep and Swine—Prof. G. E. Day, Guelph, Ontario.

Dairy Cattle—W. F. Stephen, Huntingdon, Quebec.

Grade Dairy Cattle—J. R. Starr, Port Williams, N. S.

Poultry—A. C. Smith, Waltham, Mass.

THE EXHIBIT OF HORSES

Some magnificent animals were shown in the horse department.

THOROUGHBREDS were few in numbers. Haphazard shown by Geo Haley, Windsor, N. S., was first in his class and champion. H. S. McFatridge & Son were second in the aged stallion class with Fox Hunter, a horse with an enviable racing record. Wm. Robinson, Halifax showed Lucio, Red Cotton and Ben Cotton, aged 3, 2 and 1 years respectively, and all sired by Lucifer, owned by the College Farm, Truro, N. S. The dam of these promising stallions is Venetta Cotton, by the great race horse, Joe Cotton. Venetta Cotton's foal of 1910, by Lucifer, was also shown.

STANDARD BREDS were out in strong numbers. Frank Power, by Rampart, Border and a horse owned by G. S. Madue, Mahone Bay, stood in their respective order, in the aged stallion class.

Krinkella, an Achille colt, and Sir Brookside, by Waronoco, captured the red and blue ribbons respectively in the three-year-old stallion class. Achille the Great, by Achille, lowered the Maritime record for two-year-olds to the 2.30 mark on October 4th and captured the red ribbon in his class without competition. There was a strong showing of brood mares with foals by their sides. The first honors went to Dina Hartshorn, by Phallico, who also won the championship for best mare, any age. The second award went to an Abbot Wilkes mare shown by G. A. Wallace, of Pictou, and G. L. Sellars, Westerly, N. S., captured third money with Lena Brazilian, by Brazilian, out of Mistake by Fearnought.

S. A. Bowser's Lady of Brookside, by Waronoco, had no competition in the four-year-old filly class.

A Baring filly had no competition in the yearling class.

G. A. Wallace's foal by King Dodds was first in his class. G. L. Sellars captured the blue ribbon in the foal class, with an Achille foal, out of Lena Brazilian. An Allright foal, out of Lucy G., owned by E. J. McKenna, Kingston, N. S., captured the third award.

Border was shown with three of his get.

ROADSTERS were out in strong numbers. In the brood mare class, a Good Luck's Favor mare stood in first place closely followed in second place by Bronze Jenny, by Bronze Chief, out of a dam by General Williams, a son of the great Lexington.

In the three-year-old filly class, Border, Achille and Lucifer colts stood in the order named. The Achille colt was Dr. Achille out of Sadie Preceptor and gives indications of being a very speedy colt.

Sabledom, Achille and Lucifer colts carried off the choicest morsels in the two-year-old class.

The Surveyor and Lucifer were the sires of the first and second prize winners in the yearling class.

The first and third prize foals of 1910 were sired by The Surveyor and Baring was responsible for the second prize youngster.

Border and Dr. Ferren colts were first and second in the class for single horse in harness.

CARRIAGE HORSES were not very numerous and there was no competition in any section excepting in the single horse, in harness, section, where Harry, a Nelson bred horse, Sabledom and Dr. Ferren colts captured the awards in their respective order. In the three-year-old class, John A. Dalrymple showed Charlie D., by Isle of Dew, out of a Melburne King dam. G. L. Sellars had a very nice, large filly, Dora Achille, by Achille, in the two-year-old class.

Cherry Lane Sunrise [26609]

1st prize two-year old at the Dominion Exhibition, St. John, N. B., 1910. A son of Barcheskie Kings Own (Imp.) the champion Ayrshire Bull of America. Owned by James Barrett & Sons, Hill Grove Stock Farm, Crouchville, St. John, N. B.

F. W. Foster had a Sabledom colt in the yearling class.

Rev. R. T. Hawkes, Bartibogue, N. B., had the only brood mare with foal by her side.

PONIES were few in numbers and nothing extra in quality.

GENERAL PURPOSE HORSES were also few in numbers. The first prize winner, in the four-year-old class, was by Barrister, out of a Percheron dam.

The only horse in the three-year old class was sired by Corrigor, Jr., and was out of a mare of French breeding.

There was some fairly strong competition in the two-year-old class. Alfred Keddy, Dartmouth, showed a yearling colt and Thos. Aylward, Falmouth, N. S., had the only mare with foal by her side.

HEAVY DRAFT HORSES. — This class brought out some good animals, but the competition was not very keen. Wm. O'Brien & Sons, Windsor Forks, showed an aged mare by Dumflower, a two-year-old filly, by Performer and their brood mare Kate Claxton, with her foal by Norseman.

William Sharp, Windsor, had the first prize 3-year-old mare, the daughter of Baron Frederic. He alro had a Baron Frederic gelding at the top of the list in the two-year-old class and another in the yearling section. The three last mentioned, colts were out of Jess, the mare shown with three of her offspring. Sharp's Bell and Jess, both by Merry Monarch, snatched the red ribbon in the matched team section, from a team shown by J. & M. McGrath, Halifax, N. S.

Harry Stewart, Shubenacadie, captured the blue ribbon in the yearling class with a Pride of Windham colt. Harry McKenzie, Shubenacadie, won second place in the three-year-old section with a Full of Fashion colt. Jonathan Adams, Yarmouth, had the second prize aged mare.

HACKNEYS were few in numbers. The only entries being Sensation in the aged stallion class, Model Performer in the three-year-old stallion class, Seaham Forrester, imported by Dr. C. A. Webster, Yarmouth, N. S., in the two-year-old class, the winner of championship diploma for stallion, any age, Cock O' the North, in the yearling stallion section and Langton Lily and her yearling filly Langton Belle, and her foal of 1910.

COACH HORSES.—H. C. Jewett's aged stallion Galloway was the only entry in the Coach Horse class.

CLYDESDALES.—The Clyde class at Halifax, was the main spring of the horse show. It was the best showing of Clydes ever made in Halifax. Competition was red hot in many sections and not infrequently a lot of good specimens were out side the monies' pale. Logan Bros., Amherst, N. S.; R. S. Starr, Port Williams, N. S., and R. A. Snowball, Chatham, N. B., were the strongest competitors. Other exhibitors who came within the monies' pale were, H. W. Corning, Chegoggin, N. S., with Baron Corning, by Baron Graham, a son of Baron Primrose; P. C. Brown, Charlottetowo, P. E. I., with Lord Dalmaney; Wm. O'Brien & Sons with Norseman; and Fred S. Black, Amherst, with a two-year-old stallion, out of Flash Favorite. In the aged stallion class, Baron Primrose stood at the head of the list and was fol-

(Continued on page 21.)

Peerless Lawn Fence

Is Strong and Attractive. All the wires are uniformly crimped, large gauge, steel spring wire, heavily galvanized and coated with white enamel paint. Never sags, never rusts. Improve your property with a Peerless Fence. Cheap as wood and more handsome and durable. Also full line of farm and poultry fence and gates. Write for information.

THE BANWELL HOXIE WIRE FENCE CO., Ltd.
Dept. K, Hamilton, Ont., Winnipeg, Man.

PERFECT MAPLE EVAPORATOR

A first-class maple evaporator that will make **good clear**—the kind you like—syrup, with a **very small** quantity of fuel. Price **so low** that the poorest man can buy.

Every one GUARANTEED—if not as represented **fire it back** at our expense. Sold direct to the farmer. Turns that sugar bush of yours into a paying business. Don't take our word for it. Send for our new pamphlet. It tells what the fellow who has used it thinks.

THE STEEL TROUGH & MACHINE CO,
No. 7 James st., Tweed, Ont.

PILES CURED at HOME by New Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309, Windsor, Ont.

The Prince Edward Island Exhibition

The Tenth Prince Edward Island Agricultural and Industrial Exhibition, open to the Maritime Provinces, which opened its doors for the general public on Monday morning, September 19th and closed its gates on Friday evening, September 23rd, was also, for the second time in its history, open to all Canada.

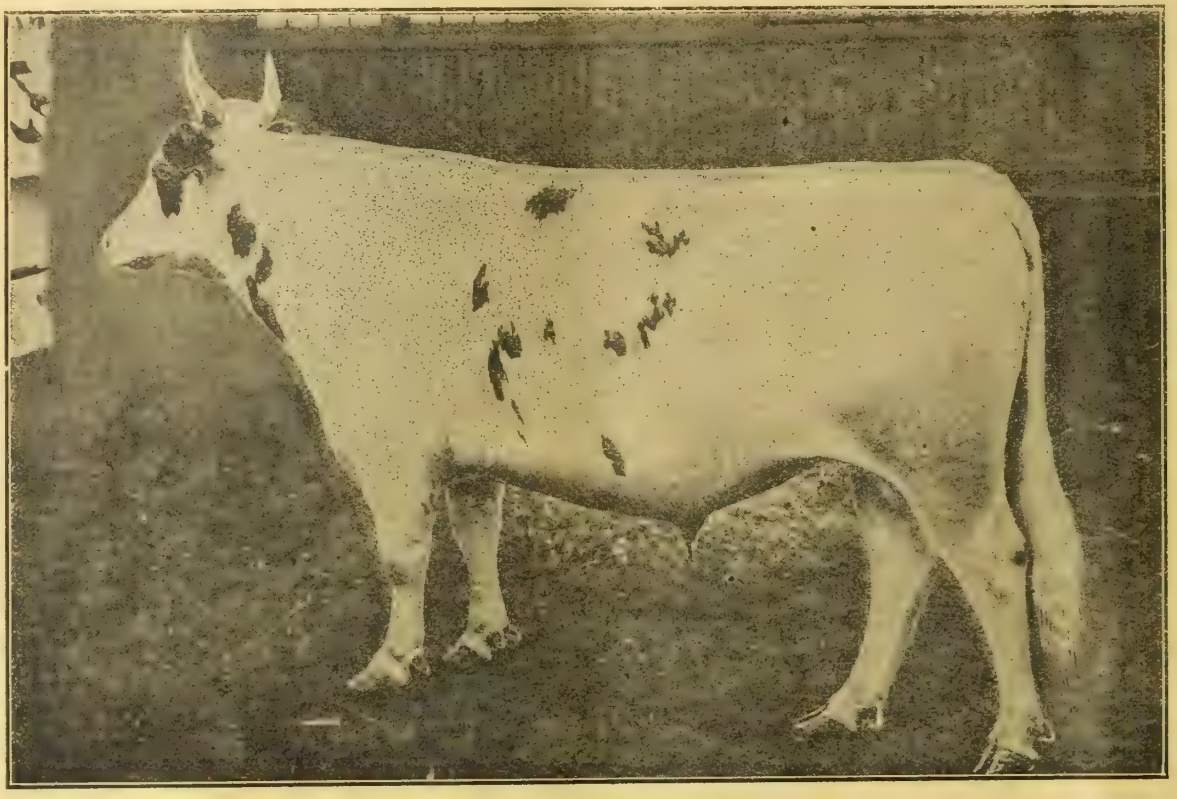
An encouraging grant of $10,000 from the Federal Government, supplemented by the usual grant from the local government helped the exhibition association, very materially, in hanging up $14,000 in cash prizes for competition in the various classes for live stock, agricultural products, etc.

With the exception of Tuesday, the second day of the fair, which brought extremely wet weather, that greatly hindered the work of judging the cattle and horses, the other days of the fair were what might be termed "made to order days."

Hon. R. R. Fitzgerald, President; C. R. Smallwood, Secy.-Treas., and directors, Messrs. John J Davies, Hon. G. E. Hughes, R. E. Longworth, Frank R. Heartz, Hon, John Richards and Jas. Paton were at the helms of their respective departments and it is needless to say that the work went on without a hitch.

Some, much needed, improvements in the line of new additional sheep, swine and cattle sheds as well as a large machinery hall, have been built. The main building contained the dairy products, agricultural and horticultural products as well as the various exhibits of home made articles, several cream separator exhibits, and exhibits of ranges and the various artistic and attractive booths of several of Prince Edward Island's most progressive business houses.

In and near the machinery hall were gasoline engines, potato diggers and planters, threshing machines, portable forges, litter carriers, feed boilers, cow stanchions and other implements of interest to the farmer. The Pickering Vehicle and Wheel Co., New Glasgow, N. S., showed one of their wagons equipped with roller bearing axles and anti-buckling wheels that attracted considerable attention.



Netherall Milkman.

Grand Champion Ayrshire bull at the Dominion Exhibition, St. John, N. B. and at Sherbrooke, Quebec, in 1910 and at Ottawa in 1909. Owned by P. D. McArthur, North Georgetown, Que.

THE AGRICULTURAL PRODUCTS were judged by Mr. S. J. Moore, of the Seed Division, Ottawa, assisted by Mr. J. B. Andrews, on of Prince Edward Island's wide awake sons. The grain and seed classes were well filled with a lot of well matured samples. Peter Brodie, Little York, John Berryan, East Royalty, J. McLean, Southport and Cecil Stewart, Hampshire, won in their respective order on collections of best early varieties of potatoes. Mr. Brodie's first prize collection contained the following varieties:—Beauty of Hebron, Clark's White Kidney, Early Prize, White Rose, Bliss Triumph, Canadian Beauty, Early Ohio, Early York, Holten Rose, Rochester Rose and Early Rose. The first prize for collection of best late varieties also went to Mr. Peter Brodie, on the following varieties:—Money Maker, Carmen No. 1, Maggie Murphy, Scotch Rock, Green Mountain, Snowball, Empire State, Garnett, Aberdeen, Burpee's Black, American Wonder, Pat's Choice, Prince Albert, Improved Dakota, McIntyre, Jenny Lind and Copperas. Dr. McPhail, Orwell, had the best collection of white varieties. An interesting feature of his collection was a dish of sets which had been planted last spring, and which grew a crop without deteriorating in any noticeable way, a feature which the doctor attributes to the importance of planting good, sound sets in well tilled soil. The best collection of field roots were shown by Patrick Curley, W. B Drake and John Rogerson. Miss Penelope McKinnon had the best collection of garden vegetables.

THE DAIRY PRODUCTS were judged by Mr. Harvey Mitchell, of the Dairy Department, Ottawa. There was an exceedingly good showing made by the creamery men and home-dairymen of Prince Edward Island. The quality, throughout, was of a high standard. The Island dairymen are wakening up to their opportunities; they are a live lot of men and the work that is being done amongst them by Dairy Supt. Morrow, and by Mr. Mitchell, in inciting them to higher ideals in manufacture and production is fast making its power felt.

THE FRUIT was judged by Mr. R. W. Starr, the veteran judge, of Wolfville, N. S. Although four score years of age he looks as if he were fit for many more years of active service in the fruit judging line. He did not find the quantity of fruit so large as last year, but the quality was better than he expected to find, on account of the unfavorable season. Strongest competition was in the Duchess and Wealthy classes closely followed by Red Astrachans. The Alexanders, next in importance, were not represented so largely as usual. There was a fair representation of all the other kinds called for. Nonpariels, Rhode Island Greenings and Baldwins were not very satisfactory specimens to Judge Starr, who is of the opinion, based on experience and observation, that P. E. I. is too far north to successfully grow these varieties. The Ben Davis apples shown were very good. Plums were of fine quality and other fruits were creditable.

H. A. D'Almaine and H D. Johnson, of Nova Scotia, were over with entries, in nearly every class; but the Island fruit growers were too much for them, in a great many of the classes. The most successful Island prize winners were A. E. Dewar, who captured the red ticket for best collection two sorts of commercial apples, and best county collection; S. R. Lane who captured the red for best collection of 5 sorts Island grown apples; E. G. Love, A. A. Moore, Anthony Essory, Mrs. John Elliott, Robt. Jenkins, Wm. McIntyre & Sons, W. C. White,. John Newson, Gordon Irving, J. J. Hughes, Helena Ferguson, James Howard, Peter McCallum, D. J. Stewart, Isaac Crosby, F. Dogherty, Edwin Carew, Wm. Hughes, Mrs.Wm. Lowther, J. Arthur, Mrs. Annie Robertson, Peter McN. Robertson, Chas. Stewart, Chas. Newson, H. E. Ferguson, Mrs. D. McDonald, L. A. Arsenault, Geo. E. Fall, Miss Hazel White, E. E. Gallant, F. H. Beer, W. B. Drake, J. C. Irving, Mrs. G. W. Hodgson, Otis Seary, Cyril Howard, F. W. Prowse, Mrs. Gregory and L. P. Tanton. Miss Penelope McKinnon and Mrs. F. Furze won first and second places, respectively, for best arranged fruit, for dining table. H. D. Johnson had the best collection of pears. Arthur Tanton, Southport, had the best collection of plums, while A. E. Dewar and Geo. King had the first and second place displays of preserved fruits, in glass.

The Prince Edward Island Experimental Farm had an interesting exhibit of the products of the farm, with statistics that were eye-openers re the production of crops when proper soil cultivation methods are employed. Superintendent Clark is doing exceptionally good work on the Island Farm and undoubtedly his influence will be felt throughout the length and breadth of the land.

THE HORSE CLASSES are always a centre of attraction at a Prince Edward Island exhibition. The Island is looked to as a place where good horses are raised and not a few of the visitors to the fair are attracted by the horse show. Some go there to see what Island horse breeders are doing and not a few go there to buy. Visitors to the fair were not disappointed this year, in the point of numbers, or in the quality of the horses. The light horse classes were judged by Mr. S. B. Fuller, Woodstock, Ontario, and the heavier classes got their awards under James Henderson, another distinguished horse judge, who did justice to the various classes presented before him.

ROADSTERS made a strong showing in nearly every section. In the aged stallion class there were some very handsome horses that could show a lively gait. Included in the number was old Princeton, now in his 29th year, with a mark of 2.19 to a high wheel sulky 24 years ago. He is still as lively as a colt. The honors in this class went to Darkwood, Baron Ajalon and Joe Dillion. In the other sections of the class some trappy Oakley Baron, Parkwood and Commodore colts were shown that reflected credit on their illustrious sires.

CARRIAGE HORSES were out in even greater numbers than were the roadsters. Oakley Baron led the way in the aged stallion class followed in second and third places by Border and Perfection. Model Performer, June Day, Fashioner, Parkside Junior and Oakley Baron colts were prominent among the winners in the other sections of this class. A full list of the prize winners will be found on another page.

THE CLYDESDALES attracted a great deal of attention and the average quality was away up. There were no fewer than eight mares with foals by their sides, from such sires as Lord Delmaney, Crown Rights and Craigmore. While Lord Delmaney captured the first prize in the aged stallion class as well as the Canadian Bank of Commerce Silver Medal for best heavy stallion, over 4 years old, and his get, the Charlottetown Steam Navigation Co's. special prize of $20.00 for best 4 draft colts, under 3 years old, a Crown Right foal led the way in the class for foals of 1910, followed in second and third places by Lord Delmaney foals. Baron Belgredden, Atlas, Ajax and Argo won in their respective order in the three-year-old stallion class. Scotland Yet and Reformer colts led the way in the yearling stallion class. In the brood mare section, Sylvania,

with a Crown Rights' foal, Muldapia, with a Craigmore foal and Rose Connaught, with a Crown Right's foal, stood in the order named. The Clyde class was really "the class" of the show and contained many well coupled low down clean boned, wide loined individuals of high merit.

THOROUGHBRED Stallions were conspicuous by their absence, but in the class for progeny of Thoroughbred Stallions there was a good showing of clean cut Woodburn, Haphazard and June Day colts.

HACKNEYS were few in numbers. R. A. Snowball, Chatham, N. B., showed Model Performer and J. B. Roper, Charlottetown, was on hand with Fashioner, in the aged stallion class. The honors were placed in the order named.

SHIRE HORSES were shown by Daniel McGregor, who showed Eskham Waggoner, J. M. Leard and John P. Morris who showed a brood mare with her foal by her side and a yearling stallion.

DRAFT HORSES were out in large numbers. There were five, three-year old fillies, ten two-year-old fillies; eight yearling fillies, five foals of 1910, five brood mares, four draft mares, and two draft geldings over 1400 lbs. The only section that did not fill was the section for pair of draft horses, shown in harness, to a truck wagon. The quality in the draft classes was excellent throughout and represented the class of horses for which Prince Edward Island farmers are realizing high prices, with a demand exceeding the supply.

The GENERAL PURPOSE HORSE CLASSES brought out some good, useful individuals, a total of sixteen including all sections. Some very desirable brood mares and young stuff were shown.

THE WALKING HORSES made matters lively—seventeen in the carriage class and six in the draft class showed that Prince Edward Island horsemen are not neglecting to train their horses to walk at a good fast gait, a valuable characteristic in any horse. Hon. John Richards showed a nice pair of matched ponies. There were three entries in the class for Delivery or Express horses.

BEEF CATTLE.

That beef cattle is being rapidly supplanted by dairy cattle on Prince Edward Island, is very claerly set forth, when one compares the number of Island beef cattle shown at the exhibition this year with the numbers shown in former years. The only Island breeders who seem to be upholding the beef cattle reputation are, Thos. P. Cass, who was out with a few Shorthorns that might have stood higher were they better fitted, Francis Chowen and Edward McDonald. Crisp Moore, S. C. Lane and John C. Clark showed aged bulls that would stand better fitting. A. H. Boswell, T. P. Cass and R. E. Longworth showed some beef grades.

Mr. James I. Davidson, Balsam, Ontario, placed the awards.

W. W. Black was on hand with his Herefords and won his laurels, as usual, without competition. We often wonder why some other beef breeders do not take a leaf out of Mr. Black's book and show their stock in the pink of condition. Mr. Black also won very extensively in every section of the classes for beef grades and fat steers, in which he exhibited.

Snowball's Shorthorns were there in fine fettle and won first place in every section in which they were entered; their principal competitor being T. P. Cass, who had the largest number of Shorthorns on the grounds. Some of them were excellent individuals, but, as already said, lacking in proper fitting. They were in fair, field condition.

DAIRY CATTLE.

The dairy classes were well filled with as fine a lot of individuals as one would wish to see. The splendid Ayrshire herds owned by Easton Bros., Simmons Bros. and other Island breeders, of lesser note, whose names will be found in occasional places throughout the prize list, were supplemented by the two best and largest herds in the province of New Brunswick, viz., The Maple Grove herd owned by M. H. Parlee, Lower Millstream, and the Spring Brook herd owned by McIntyre Bros., Sussex Corner. The Island herds were fresh and unwearied while the mainland herds had just completed a couple weeks' hard work at the Dominion Exhibition, St. John, and a long, tedious train and boat knocking about enroute to Charlottetown.

A. C. Holman, of Ontario, placed the awards and some of the boys were not particularly struck on his judgment as they were under the impression that he was judging their Ayrshires through Holstein eyes.

Every section of the Ayrshire class was well filled. The females, in all the herds, were a particularly milky looking lot, of well kept individuals.

Easton Bros. captured four red ribbons and one blue ribbon on bulls and three blue ribbons and one white ribbon on females. Simmons Bros. walked away with one red ribbon in the bull classes, a red ribbon, a fourth and fifth prize in the female classes and first on aged herd. McIntyre Bros., and M. H. Parlee won most of the remainder of the awards in this class. A full list of the winnings will be found elsewhere in this issue.

JERSEYS were shown by William Clark, Wallace Stead, Jas. Essory, Spurgeon Warren and Francis Chowen, Prince Edward Island breeders, and James E. Baker & Sons, of Nova Scotia, and were judged by Mr. A. C. Holman. Wm. Clark and Wallace Stead had the greatest number of entries and they showed a class of Jerseys of which they need not be ashamed. Clark led the way in nearly every class, in which he had entries. Stead had the best junior yearling bull, Highfield Prince II, at the head of the best young herd. Clark led the way in the aged herd class. Jas. Essory had the only two-year-old bull. Jas. E. Baker had no competition in the senior yearling bull class and led the way in the two-year-old heifer class.

GUERNSEYS were also judged by Mr. A. C. Holman. The Roper Bros. and the James Roper Sr., herds were out in full force with very few additions other than the individuals shown at St. John, during the previous weeks. Most of the red ribbons went to Roper Bros.' herd. The classes, throughout were very creditable.

THE JERSEY AND GUERNSEY GRADES contained a lot of useful looking cows, such as a farmer might expect to get by following breeding to a pure bred bull. The class contained producers of exceptionally high merit.

HOLSTEINS were out in large numbers. There were no Black and Whites from the mainland herds although not a few of the winners held a prominent place, at one time, in mainland herds. These have changed hands and are now doing good work in the herds into which they have been adopted. That Holsteins are fast gaining ground in Prince Edward Island is evidenced by the large number of bulls that were shown, by individual farmers, and the ever increasing number of grades, of producing merit that is

You can rightly judge underwear by details. The securing of drawer straps—the fastening of buttons—the sewing; such details as there indicate a manufacturer's regard for thoroughness. Stanfield's Unshrinkable Underwear is made with but one idea in mind—to give you long wearing satisfaction. The drawer straps are securely attached on special staying machines. Nothing but best 6 ply thread and utmost care are good enough for our sewing operations throughout. The buttons go on to stay. Every seam, every stitch is tight. Stanfield's Unshrinkable Underwear is dependable.

Drawer Straps put on to stay on.

STANFIELD'S Unshrinkable UNDERWEAR

Made both for women and for men in perfectly fitting sizes. Twenty-one different weights and qualities; from warm, heavy ribbed garments particularly suitable for outdoor workers to the soft, finely knitted underwear so soothing to sensitive skins. Your local dealer sells Slanfield's Unshrinkable Underwear. Catalog on request.

STANFIELDS LIMITED, - - - TRURO, N.S. 23

shown every year.

Lea & Clark and Gavin Harding were the principal competitors. They were both out to win, with the very best they possessed. Molly's Prince Posch, Harding's two-year-old bull won the male championship. The female championship went to Lea & Clark's Jacoba Emily III. The special prize for three, the get of one sire, went to Lea & Clark, on the get of Jacob Van Voran. Their Jacoba Johanna was first with two of her offspring. Harding won first on three under twelve months, the get of one sire with the get of King Pieterje DeKol. He also won the Bank of Commerce Bronze Medal for the best pure bred milch cow, with Jewel Sylvia. The other awards, in this class, was pretty evenly divided between these two herds.

SHEEP.

Sheep were there in abundance, with quality to burn. The Island flocks were supplemented by flocks from the mainland. J. E. Baker & Sons, Chas. Symes, H. W. Corning, E. Sarvant and Burder Goodwin were there with their best to try their luck against the Island shepherds. Competition was keen in all classes so that no one had a walk-over. Albert Boswall, S. L. Boswall and S. C. Lane captured all the Leicester prizes. H. W. Corning, John Tweedy and Austen Judson competed in the Cotswold classes. Albert Boswall, Jr., Chas. Symes, Ernest Lund and Earl B. Boswall were on deck with their Lincolns. Cephas Nunn, James E. Baker & Sons and Oliver Saunders were there with some splendid Southdowns. Geo. L. Boswall and Cephas Nunn put up a two cornered contest in the Shropshire class. Jas. E. Baker & Sons, Burder Goodwin, A. H. Boswall, Hugh McPhee had magnificent Oxford Downs. The battle royal being between the Baker and Goodwin flocks. Albert Boswall, Jr., and Earl B. Boswall exhibited Suffolks. Cephas Nunn and Oliver Nunn were the only exhibitors of Hampshire Downs. Emerson Sarvant, Geo. L. Boswall, Cephas Nunn and John Tweedy locked horns in the Dorset Horned class, which seems to be rapidly coming to the front in increased numbers. Grades and fat sheep were there in abundance and there was not a weak one among them.

Mr. James I. Davidson was the judge of the sheep classes.

SWINE.

After the dissappointingly small number of swine exhibited at St. John, it was a relief on landing in Charlottetown to find so many pigs entered in their respective classes. Berkshires, Yorkshires, Tamworths and Chester Whites, were there in abundance and quality was away up. The fat hog and the typical bacon hog were there side by side with the latter leading in point of numbers. A. C. Holman and M. H. Parlee placed the awards which will be found an another page.

POULTRY.

Seth Jones, the noted breeder and judge of Sussex, N. B., gave the decisions in the poultry classes, which were so well filled that he had a big day's work on his hands; but he hustled in his usual style, and got through to hie away to judge at same other show.

The best show of poultry that has ever been shown at a fall fair in Charlottetown was there this year and we might also add that it looked like a clean show. There was very little, if any, evidence of the professional huckster and poultry fakir.

S. C. White Leghorns has entries of 11 cocks, 11 hens, 7 cockerels and 7 pullets. S. C. Brown Leghorns had entries of 11 cocks, 12 hens, 12 cockerels and 13 pullets. S. C. Black Minorcas, 5 cocks, 9 hens, 12 cockerels and 10 pullets. Buff Orpingtons, 9 cocks, 10 hens, 9 cockerels and 9 pullets. Barred Rocks, 5 cocks 7 hens, 8 cockerels and 8 pullets. White Rocks 5 cocks and 6hens, Buff Rocks, 3 cocks f and 4 hens. White Wyandottes, 7 cocks, 7 hens, 12 cockerels and 12 pullets. The foregoing classes were the heaviest in entries. There were also a large number of entries in other varieties of Orpingtons, other than Buff, and a fair number of entries in the other listed sections. Foster's Plymouth Rocks and Lightizer's White Wyandottes were two sights that stood out very prominently in many of the coops containing the prize-winning Plymouth Rock and White Wyandotte varieties, after the judging was completed. The birds were good advertisements, in themselves, without the signs. It pays to let visitors know who the owners of the birds are in an attractive way. It is a business method that might be followed more extensively.

Turkeys, ducks and geese were out in strong numbers and there was not a mean specimen among them.

THE BOYS' JUDGING COMPETITION.

is one ol the features at the Charlottetown Exhibition that is rapidly making good stock men, of Prince Edward Island boys. The judging contests in beef and dairy cattle classes are causing the boys to take an active interest in live stock. They follow the judges closely in their work and while at home they study the characteristics that belong to first-class animals. Eleven boys entered the competition in judging beef cattle and an even dozen took part in the dairy judging class. Many of the remarks made by the boys showed that they know what they are looking for and they can pick one animal to pieces for its slack points and praise another for its good points as well as some men who have had wider experience.

The milking test had only a few entries. Wm. Clark, North Wiltshire had two Jerseys entered in the pure bred cow class and Andrew McRay, East Royalty, had an Ayrshire in the pure bred heifer class that made good work.

The Charlottetown 1910 fair is over. The management tried their best to give its patrons a good show. It is conceded by all concerned that they accomplished their aim. Despite the weather man's pranks, on Tuesday, which we must forget in lieu of the beautiful September weather dealt out during the remaining days of the fair, let us hope that when the accounts are all made up a good fat balance will be found where our genial friend, Secretary Smallwood would like it to be.

Charlottetown Prize List.

Horses.

PROGENY OF THOROUGHBRED STALLION.

Mare, 3 yrs. old or over, (3)—1, A. Horne; 2, R. E. Longworth; 3, J. Stewart.
Filly, 3 yrs. old (2)—1, W. W. Owen.
Filly, 2 yrs. old (1)—1, John Stewart.
Filly, 1 yr. old (1)—1, Daniel McDonald.

HACKNEYS.

Stallion, 3 yrs. old and upwards (2)—1, R. A. Snowball; 2, J. B. Roper.
Filly, 1 yr. old (1)—1, Almon Boswall.
J. B. Roper's Special for best Hackney foal of 1910 sired by "Fashioner" (4)—Almon Boswall.

ROADSTERS.

Stallion, 4 yrs. old and upwards (7)—1, John McPhee; 2, S. A. Rockford; 3, John Stewart.
Stallion, 3 yrs. old, (1)—1, R. E. Bagnall.
Stallion, 2 yrs. old, (4)—1, Byrne Bros.; 2, Roderick Matheson; 3, A. Kennedy.
Stallion, 1 yr. old (2)—1, Byrne Bros.; 2, P. McN. Robertson.
Filly, 3 yrs. old, (5)—1, Geo. H. Reddin; 2, Wm. Bateman; 3, Frederick Turner.
Filly, 2 yrs. old (4)—1, B. McMillan; 2, Vernon McMillan; 3, Wm. Curran.
Brood Mare with foal at her side (1)—1, Gordon McMillan.

CARRIAGE HORSES.

Stallion, 4 yrs. old and upwards, in harness, (5)—1, W. S. McKie; 2, H. C. Lydiard; 3, P. C. Brown.
Stallion, 3 yrs. old, (4)—1, John Ford; 2, Daniel N. Taylor; 3, W. A. McNeill.
Stallion, 2 yrs. old, (5)—1, Almon Boswall; 2, J. A. Cummings; 3, J. J. McLeod.

Do Your Shopping By Mail at Paquet's.

THE PAQUET Mail Order organization is always at your service. Our system is simple, practical and universally satisfactory. Send us your orders by mail and one of our staff of Expert Shoppers will select the goods for you in person. If you have not yet received your copy of

FATHER MORRISCY'S REMEDIES.

Cured a Truro Lady of Both Lung and Kidney Troubles.

Truro, N.S., Jan. 14th., 1910.
Father Morriscy Med. Co., Ltd.

For some time I had been troubled with a very dry cough and pain in my lungs. I made up my mind to try your medecine, and had used one bottle of No. 10 (Lung Tonic) when the pain left me and I felt much better.

My kidneys troubled me quite a lot also, and I purchased a box of your No. 7 (rheumatism and kidney cure) and since taking the tablets I have had no pain in my side or back. I spent quite a lot of money in medicine, but none of the remedies I tried ever helped me, until a lady friend showed me your advertisement. I am now fat and healthy, and your remedies have saved me from the grave.

(Miss) MARTHA WHITE.

None of Father Morriscy's remedies have ever been heralded as "cure-alls." The wise priest-physician prescribed a special remedy for each kind of disease—a remedy skilfully devised to cure that particular trouble and that only.

No. 10 (Lung Tonic), besides curing colds, inflammation, pneumonia, bronchitis and other diseases of throat and lungs, strengthens these organs and gives them vigour to resist a return of the trouble.

No. 7 Tablets stimulate weak kidneys so that they can properly perform their function of filtering from the blood the impurities that cause rheumatism.

The action of both these remedies is hastened if Father Morriscy's Liniment is applied freely externally.

No. 7 Tablets for Kidneys and Rheumatism are put up in 50c. boxes; No 10 (Lung Tonic) in 25c. and 50c. bottles, and Father Morriscy's Liniment in 25c. bottles. At your dealer's, or from Father Morriscy Medicine Co., Ltd., Chatham, N.B. 97

SEALED TENDERS addressed to the undersigned and endorsed "Tender for Breakwater at Great Salmon River, N. B.," will be received at this office until 4.00 P M. on Tuesday, October 18, 1910, for the construction of a Breakwater at Great Salmon River, St. John County, N. B

Plans, specification, and form of contract can be seen and forms of tender obtained at this Department, at the offices of E. T. P. Shewen, Esq., District Engineer, St John, N.B; Geoffrey Stead. Esq., District Engineer, Chatham, N. B., and on application to the Postmaster at Salmon River, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works for the sum of fifteen hundred ($1.500.00) dollars, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS
Secretary.

Department of Public Works,
Ottawa, September 17, 1910.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department

Farmers' Set from actual experience and Creamery Sets, under Joint Stock Co. auspices, are parts of our course of training.

Send for new catalogue giving rates and full information.

THE ST. JOHN Business COLLEGE

Farmers Do Exceptionally Well

——As Agents for the——

Empire Cream Separatrs

1st.—Because no selling experience is necessary.

2nd.—Because one farmer understands the other.

3rd.—Because the Empire Cream Separator is the easiest to clean, easiest to turn and easiest to sell.

4th.—Because selling separators can be done at odd times without neglecting farm work.

5th.—Because the makers of Empire Cream Separators stand behind every machine.

6th.—Because there is no fault-finding after machine has been placed.

Write us to-day for further particulars.

The Empire Cream Separator Company of Canada,

Sussex, - - N. B.

DAIRYING.

C. W. McDougall, Dairy Inspector, staff Contributor.

Larger Milk Yields.

The whole secret of larger yields of milk is that a cow is considered to make milk from her whole system, devoting all her energy to the work. She has, as it were, a storage battery storing up energy whilst dry, and strengthening her whole system. The feed fed whilst a cow is dry often has more effect on large production than that feed fed, at the time she is producing heavily. A cow's stomach can easily be overloaded. A cow that is fed too much and is bilious and sick is not likely to produce so well as if fed just enough to satisfy her.

Many cows are knocked out by over feeding. It is impossible to say how much a caw should have to produce the best as so many cows have to be fed and considered as individuals. A cow when she first freshens must be considered as an individual. Owing to the tax of motherhood her stomach will not be so strong and she must be fed very judiciously for a couple of weeks. Considering the demands of motherhood in itself no little tax upon the cow besides producing heavily, we see how absolutely essential it is to give a cow the very best care and feed at all times. It is necessary if we expect good work from the cows to fit them for the work.

A cow should be dry two months or more yearly and whilst dry is the time to feed her for the next year's work, to strengthen her up. This is an essential point in managing dairy cows. But it is not followed. Not well enough understood what a tremendous tax it is upon a cow to produce milk yearly? If we want say 7,000 lbs. of milk from a cow consider that she is providing 2,800 quarts of milk equal in value to that many pounds of beef. How important it is to recuperate her system. Furnish her with energy for the next year's work whilst dry. Is this often done? On the contrary cows are dried up often not to feed them up and recuperate them but to save feed on them. The result is a poor cow, poor in energy, weak, when she should be strong. So long as the present system or lack of system prevails we cannot hope to get large yields.

A cow to give large yields must be bred with the inherent ability to devote her energy to milk production. The ability is of no use unless she has the energy. This can only be secured in a good measure whilst the cow is dry. It is well known cows do not give the same quantity of milk each year. It will depend upon what fettle she is in when freshening. Sometimes a cow will not get in as good condition as we would desire. It may be that the pasture has been poor and the cow has run herself down more than we made allowance for. She may have milked so heavily she has not recuperated properly. But the greatest cause of a poor condition is that no attempt has been made to put her into condition. Hence low production is sure to follow.

It is well known by some dairy men who are considered good feeders, that it is necessary to feed a cow that has been in poor hands two years to get her system strengthened up so that she will be able to do her best work. She will likely give considerable more the first year of good feeding, but it takes two years to bring her to her maximum production. This shows that the milk does not come directly from the feed, but as the energy is built up in the cow she is stronger and is able to do greater work.

Of course it is important that a cow should be fed well when she is producing else she will draw more largely upon her bodily energy and when she has depleted her system she will have to shrink in her milk flow. However, it is always injurious to feed a cow too much or overload her stomach. We want cows that are constitutionally strong, and we must do all we can by judicious feeding, and care to keep the cow in as good fettle as possible.

But since with the very best care and feed we can give a good cow, will draw upon her system and deplete her energy, it is necessary to have her dry long enough to replace this energy. It is because this is not done and cows are fed so poorly whilst dry that we see such poor re- e is no use of a man asking for a ration when a cow is fresh. A man needs to know how to feed her whilst dry as well as all the year round. The best way to teach that is to show the tremendous energy that the cow expends in producing.

The Magnet Cream Separator

is **entirely different** in its **construction** and is **better** than any other cream separator.

It is built

MECHANICALLY CORRECT.

The MAGNET Skimming Perfectly sitting on the rough PRAIRIE
THE SQUARE GEAR AND DOUBLE SUPPORTED BOWL DOES IT
STEADY AS A ROCK

MECHANICALLY CORRECT means putting the power on the machine by properly **graded steps** or gears. When you see a very **large wheel** turning a **very small one,** it is a **violation** of **mechanical rules** and means wear, breakage and **trouble,** but is done to **save the cost** of the extra wheels of steps. The **Canadians** who originated the **MAGNET** were **educated mechanics** and could **not** be induced to apply the make shift, worm gear drive, adopted by makers who preferred cheapness in construction to durability. Use has shown that the worm gear drive soon wears, the bowl wobbles and then considerable butter fat goes into the skim milk at each separation. The square gear does **not wear** and the **MAGNET** skims as closely after twelve years' use as the first day it skimmed.

Do not take our say so, examine for yourself.

Take the **MAGNET** stand, it is **solid, strong** and **rigid,** constructed to **hold the gears without vibration** or **possibility of accident to anyone.**

Square gear drive is used, the only drive approved of for a **fast running** machine like a cream separator.

The shape of the **MAGNET** bowl is **different** from others, being **longer,** enabling the insertion of the famous **one piece skimmer,** so constructed as to take out all the butter fat but a trace, at the same time **draws** out all **dirt and foreign matter** and holds the same to be washed off. This skimmer delivers **pure cream.**

Bronze bearings are used on the **MAGNET,** because being harder than steel they do not wear out.

Glass hard steel balls, extra large size, are used, will not wear or break.

The brake (**MAGNET PATENT**) circles the bowl, stops the machine in eight seconds, does not injure it.

The bowl is supported at both ends and cannot wobble or get out of balance (**MAGNET PATENT.**) All other separator bowls are run on one end, the vibration of which leaves butter fat in the skim milk.

Every point in the **MAGNET** is a strong point, no weak spots.

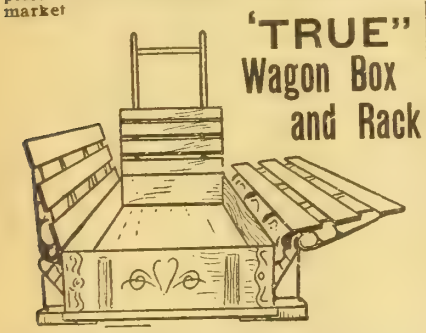
A cent postal card will give you a full demonstration of the **MAGNET** in your own dairy. No obligation to buy.

THE PETRIE MFG. CO., LIMITED,

Vancouver, Calgary, Winnipeg, Hamilton, Montreal, St. John.

Up-to-Date Specialties For Farmers And Gardeners.

Things you need—implements and tools that should be on every truck garden and farm. Our way of making these specialties assures adaptability, strength and service at the minimum price for the best goods of their kind on the market



"TRUE" Wagon Box and Rack

Without wings and ladder, it is a perfect wagon box. With them, it is the best Hay, Stock, Wood, Poultry, Corn or Fruit Rack ever invented. Adjusted to any position in a minute without wrench, hook or rope.

"Eureka" Churn

Barrel of finest stoneware—top of clear pressed glass. Churns by hand lever. The only sanitary churn made. 3 sizes—8, 10 and 12 gallons.

"Eureka" Root Cutter

will slice or shred from 1 to 2 bushels per minute. Fastest machine made—easiest running. Tapering cylinder—10 best steel knives.

"Eureka" Combination Anvil

Best iron anvil, with vice, pipe vice and drill attachment, and saw clamps. Just what you need for repairing tools and machinery. Weighs 60 pounds.

The "Bacon" Seed Drill

will handle the most delicate seed without bruising or breaking, and will sow evenly to the last seed.

Write for Catalogue

Every farmer, who wants to make money out of his farm, ought to have our new catalogue. It shows our TOOLS, Rakes, Hoes and Machines as they are, and describes their construction in detail. Write for free copy.

The Eureka Planter Co., Ltd. Woodstock, Ont.

Dairy and Conversation.

Conservation seems to be the most popular slogan of the day. In all lines of activity conservation is an absolute necessity. The hoarding of natural resources is a subject of vital importance, especially when one takes into consideration the rapidity with which the population of this country is growing. We hear much about conservation of forests, conservation of water, conservation of power and conservation of fertility; but, above all, fertility is unquestionably the most important, for upon this one thing—the fertility of the soil—depends the productiveness that feeds millions not only upon this continent but in other climes as well. Should the soil of this country be depleted, should our fields become barren and our harvest fail there would be untold suffering all over the world. It remains, then, for the American farmer to conserve the fertility that comes to him as a heritage with the virgin soil. There is no possible method of doing this so effectively as by dairying. The dairy cow is a great conservator. In this she is a great factor of national importance. Chemical fertilizers may be used for a time but they only cause the earth to yield more read-

THE ORIGINIAL AND ONLY GENUINE

BEWARE OF IMITATIONS SOLD ON THE MERITS OF MINARD'S LINIMENT

Minard's Liniment Co., Limited

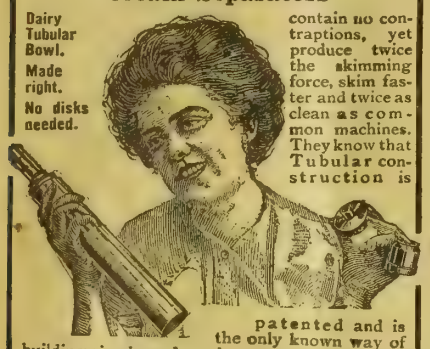
The pleasant purgative effect experienced by all who use Chamberlain's Stomach and Liver Tablets, and the healthy condition of the body and mind which they create, makes one feel joyful. Sold by all dealers.

Your cough annoys you. Keep on hacking and tearing the delicate membranes of your throat if you want to be annoyed. But if you want relief, want to be cured, take Chamberlain's Cough Remedy. Sold by all dealers.

WHY Do They Pretend?

Why do makers or agents of common cream separators pretend that such machines are modern? They know that disks or other contraptions are not needed in properly built machines. They know that contraptions are merely makeshifts to cover up lack of skimming force resulting from wrong construction. They know that

Sharples Dairy Tubular Cream Separators



contain no contraptions, yet produce twice the skimming force, skim faster and twice as clean as common machines. They know that Tubular construction is patented and is the only known way of building simple and modern separators. They know that Tubulars put common separators out of date ten years ago. Do they think they can hide these facts or mislead you by pretending an out-of-date machine is modern?

Tubulars are The World's Best. The manufacture of Tubulars is one of Canada's leading industries. Sales easily exceed most, if not all, others combined. Probably replace more common separators than any one maker of such machines sells.

Sharples 30 Yrs

ily of the elements in the soil, thus depleting it with a few harvests instead of making it more rich and prolific. Crop rotation is necessary yet crop rotation without returning the elements that are taken out by the life of the plant that is harvested is solving the problem in a half-hearted manner. Soil treated in this way will last longer than soil that is incessantly cropped but it is only a question of a few generations at least before even such fields will become depleted. What, then, is to be the ultimate outcome of the Canadian farm? Are we to have a vast expanse of barren or weak and poorly yielding fields? Such is not necessarily the case. In some parts of the European continent land that has been farmed for 1200 years is now yielding much more generously than are our so-called virgin fields. The dairy cow is the solution. By dairying one takes the minimum of soil nutriment from the earth and puts back a maximum of fertility and plant food that makes the fields richer and more profitable. In fact, by suitable and constant rotation of crops, by a liberal application of barnyard manure and by industriously following those lines of dairying that lead to the largest profits, one may build up a soil that is more productive even than the much-talked-of virgin soil that has seemed to be the acme of excellence. This well replenished, cultivated soil will furnish the plant with a more nearly balanced ration, thus encouraging a greater growth.

Straining Milk.

Straining milk does not purify it. Milking should be done with such attention given to cleanliness that it would be unnecessary to use the strainer. The utensil is of value chiefly because it removes the visible indications of impurity from milk, not because it really has any purifying effects. Small particles of manure, hairs, pieces of dead cuticle from the cow's udder and body, and dirt from the milkers hands find their way into the milk pail during the first manipulations of the udder, these impurities are churned around in the pail by the force of the streams as the milk is drawn, and by the time the pail is full this filth is all but dissolved, and no strainer yet produced can remove anything but the coarser and more insoluble substances which settle to the bottom of the bucket.

The millions of bacteria carried into the receptacle by these impurities are untouched by the strainer and go on their way rejoicing to carry ill health and disease, maybe, to all who drink the milk or use the butter made from it. We use the milk strainer because we do not like the looks of small particles of dirt and refuse in the bottoms of the milk can, or perhaps in the drinking cup. It does no harm to remove these, but gives us a sense of relief in thinking that the milk is clean because it looks clean. We seem to have discharged a moral obligation in using the strainer, forgetting that the real harm comes from the dissolved materials, the filth that goes into solution and carries its nauseating effect concealed in the pure white fluid.

It is in time of sudden mishap or accident that Chamberlain's Liniment can be relied upon to take the place of the family doctor, who cannot always be found at the moment. Then it is that Chamberlain's Liniment is never found wanting. In cases of sprains, cuts, wounds and bruises Chamberlain's Liniment takes out the soreness and drives away the pain. Sold by all dealers.

SHARP KNIFE-LIKE PAINS

Would Go Through Heart

Thousands of people go about their daily work on the verge of death and yet don't know it.

Every once in a while a pain will seem to shoot through the heart but little attention is paid to it at the time, and it is only when a violent shock comes that the weakness of the heart is apparent.

There is only one cure and that is MILBURN'S HEART AND NERVE PILLS.

Mrs. J. E. Nixon, Riverview, Ont., writes:—"Two years ago I suffered with a bad pain around my heart. At times it would almost stop beating and then, a sharp knife-like pain would seem to go through it. As I had heard Milburn's Heart and Nerve Pills were a grand remedy for the heart, I sent and got two boxes of them, and when I had only used a box and a half I was entirely free from pain."

Milburn's Heart and Nerve Pills are 50c per box, or 3 boxes for $1.25, at all dealers or will be mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

LIVE STOCK.

The Development of the Sheep Industry in Canada.

For a number of years it has been evident and it is now a matter of common knowledge that the sheep industry in Canada, particularly as regards the general production of market sheep and of high class wool, has been in an increasing decadent condition. Not only has the number of sheep owned in the country been gradually lessened but the interest in sheep growing has itself been on the wane. The census of sheep in Canada reveals the fact that the Dominion as regards the number of sheep kept compares not at all favorably with other great agricultural countries of the world. Indeed, as compared with them it has permitted sheep-raising to become a somewhat insignificant phrase of its agriculture, notwithstanding its great adaptability both as regards soil and climate for the growing of mutton and wool. In 1909 according to agricultural returns there were in the United Kingdom 31,838,833 head of sheep, in the Argentine, 67,211,754 head, in Australia 77,043,266 head, in New Zealand 23,480,707 head, while the latest returns from Canada place the number at not more than 2,705,390 head. In view of the fact that sheep have not only a direct and primary value through the actual financial returns which they make to their owners, but because they represent as well in themselves a peculiarly important asset in agriculture owing to their ability to increase soil fertility and to check and destroy the growth of weeds upon the land, the situation which the above figures suggest appears to be a rather critical one and one which may well receive careful consideration.

The reasons for the decline in the sheep industry in Canada have been the subject of much comment in various ways and while these need not be dicusssed in this note it may be well to state that the Live Stock Branch has had its attention very urgently directed toward the present unsatisfactory status of the business and in recognition of its importance to the country generally, has now decided that the time is ripe for the Canadian government to consider a comprehensive policy and to undertake definite and extended measures likely to operate toward the encouragement, improvement and development of the industry as a whole.

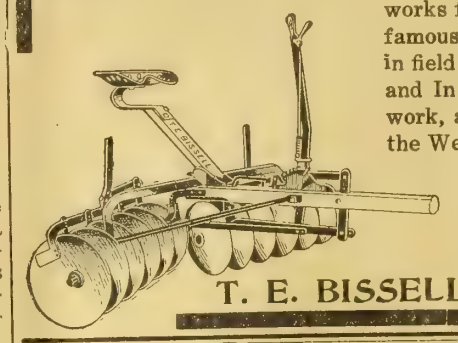
As a preliminary to the adoption of any settled policy and in order that the Live Stock Commissioner may inform himself thoroughly as to the details of the sheep and wool trade in Great Britain and the United States and as to conditions as they actually prevail in Canada, the Minister of Agriculture has authorized the appointment of a committee of two competent men to investigate the sheep situation in general in the three countries named. At the same time, it is the expectation that, without an actual visit, they will gather as much information as possible concerning the trade of the other great sheep producing countries in so far as it may be of interest in the development of the industry in Canada. It has been thought advisable to have this committee consist of, in the first place, a wool expert whose special training has made him familiar with all the technical and practical phases of the wool markets and woollen manufacture in the United Kingdom and Canada, and in the second place, a capable Canadian sheep breeder whose experience has given him a somewhat extended knowledge of sheep farming in this country. These gentlemen have already been appointed and are at present pursuing their investigations in Great Britain. The personnel of the committee consists of Mr. W. T. Ritch, of Manchester, England, and Mr. W. A. Dryden, of Brooklyn, Canada.

Mr. Ritch, though perhaps unknown to the members of the Sheep Breeders' Association, has had familiar and honorable relationship with tradespeople in Canada for a period of years, having represented, while in this country certain English cloth manufacturers whose interests he served efficiently and acceptably. Mr. Ritch's experience has made him thoroughly familiar with the woolen industry in England and Scotland, with the wool markets and manufacturing districts of that country and has besides given him a general knowledge of the woolen trade including that in staple and shoddy articles and in the manufactured product both of England and America. He has visited also in a business capacity Australia and New Zealand and had made careful observations concerning the growing and marketing of wool in these two countries. Combined with his technical knowledge, Mr. Ritch has acquired a practical understanding of the growing and handling of wool on the farm and together with this has evidenced an enthusiastic and intelligent comprehension of what may be expected from the development of the sheep industry in Canada, thus commending himself to the attention of the Commissioner in connection with the appointment of the Committee. It is felt that Mr. Ritch will be able to place such information at the disposal of the Minister, his officers and of all interested in sheep breeding in this country, as is likely to be particularly valuable in the furtherance of the scheme for the upbuilding of the industry which is now in contemplation.

The other member of the Committee, Mr. W. A. Dryden, of Brooklin, Ontario, is very well known to the stock breeders of Canada. The present owner of Maple Shade has fallen heir to many of the qualities which gave his father so large an influence in his own province, and although as yet a comparatively young man, has acquired a knowledge of the stockman's art which has already brought him to the fore amongst Canadian breeders. Mr. Dryden's collegiate and agricultural education has been such as to bring him in demand in a more or less public way, and in recent years, he has been about Canada a good deal in connection with judging and other

Test The "Bissell" in a field competition with other Out Throws.

To settle all doubt about which out throw harrow has the greatest capacity and lightest draft we ask you to test the "Bissell" Out Throw harrow in a field competition with other out throw harrows. We know the "Bissell" will outclass the field, because it is so designed that the hitch is well back, the seat projects over the frame, and the arch is directly over the gangs. This construtions removes all neck weight—enables horses to do more work. And because one gang is set slightly ahead of the other, the gangs cannot crowd or bump together. The "Bissell" Out Throw works fast and does clean work. Like the famous "Bissell" in Throw, it always wins in field trials. We also make Out Throws and In Throws with two levers for hilly work, and in 16 plate wide cut styles for the West. Send to Dept. M for "Bissell" Harrow Booklet. Remember, it isn't a genuine "Bissell" unless the "Bissell" name is stamped on the harrow.



T. E. BISSELL CO., Ltd., Elora, Ont.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure—**you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourself at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. **I know** that my home treatment is a safe and sure cure for **Leucorrhœa or Whitish discharge, Ulceration, Displacement** or **Falling** of the **Womb, Profuse, Scanty** or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weakness peculiar to our sex.**

I want to send you a **complete 10 days treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address,** tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost,** my book—"**WOMAN'S OWN MEDICAL ADVISER**" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers of Daughters,** I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness, and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really **cures** all women's diseases and makes women well, strong, plump and robust. **Just send me your address,** and the free ten days' treatment is yours, also the book. Write to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box H 309 - WINDSOR, ONT.

MAIL CONTRACT.

SEALED TENDERS addressed to the Postmaster General, will be received at Ottawa until noon on Friday, 11th November, 1910, for the conveyance of His Majesty's Mails, on a proposed Contract for four years four times per week each way, between Newtown and Sussex from the first January next.

Printed notices containing further information as to conditions of proposed Contract may be seen and blank forms of tender may be obtained at the Post Office of Newtown, Sussex and route offices and at the office of the Post Office Inspector at St. John.

POST OFFICE DEPARTMENT,
MAIL SERVICE BRANCH,
Ottawa, 26th September, 1910

G. C. ANDERSON,
Superintendent.

work under the supervision of the Live Stock Branch. Mr. Dryden's judgment is practical and his recognized popularity speaks well for the confidence which may be expected from his fellow breeders in his ability to perform, with credit to himself and them the work which he has now undertaken. In combining the services upon this committee of a practical sheep man with that of a technical expert, the Dept. has reason to believe that the problem of production and of marketing, both as regards wool and mutton, will be studied and discussed in such close relationship that the results of the enquiry will most successfully serve the purpose for which it is undertaken.

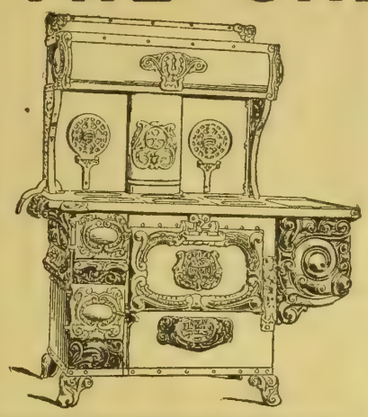
After consultation with the Live Stock Commissioner, the members of the committee have of course been allowed the liberty of depending largely upon their own initative in planning their route and in evolving the details of their investigations. The general procedure will however, be somewhat as follows: Mr. Ritch preceded Mr. Dryden to England in order to attend a number of important wool fairs in progress during August and September. There he will be in close association with wool merchants and with men interested or engaged in the wool trade, in its several branches and will thus be enabled to discuss with them in all its phases the various details of the industry in connection with both home and foreign markets.

Both members of the committee are arranging to be present at the big late summer and autumn sheep sales which are annually held in the latter part of August, during September and in October. They will visit Smithfield and the larger meat markets of London and of other important cities. It is possible also that they will be present at the annual ram sales at Kelso and at one or two other leading centres. This will bring them into intimate touch with sheep breeders, mutton raisers, dealers, butchers and provision men in all the important localities. It will give them an insight into conditions and methods as they prevail upon the farms throughout the country. It will direct their attention to the systems of marketing in operation in every stage of the business. It will furnish them with information concerning prices, profits and as to the extent and nature of the trade and, in short, give them a knowledge of the great sheep industry of the United Kingdom and of the import trade in dead mutton and lamb. It is hoped that the investigations in Great Britain will put the Branch in possession of such information and of such facts and statistics as may enable it to intelligently assist in building up a great Canadian business in the raising of sheep and also in finding a place for the Canadian products of wool and mutton in the commerce of the world.

Returning to Canada, the investigators will visit all the provinces and interview prominent sheep men and manufacturers in order to familiarize themselves with the difficulties, drawbacks and defects in connection with conditions as they now prevail, and which have hitherto operated to retard the advancement of the sheep industry in the country. It is expected that they will gather information as to the injury inflicted on our agriculture through the decline of interest in sheep raising, that they will take note of the localities, where the growing of sheep could be more easily and profitably encouraged and that, bringing to bear the suggestions gleaned from their general inquiry upon the various phases of the situation as they find it in Canada, they will draft recommendations for the guidance of the Commissioner in framing, in the very near future, such a policy as will prove in the best interests of the industry.

If time permits Mr. Ritch and Mr. Dryden will also visit the United States. In many states of the union as compared with Canada, almost uniform conditions prevail, particularly as regards the advantages that are possible and which may be derived from an extensive sheep trade. Many single States own more sheep than are to be found in the whole of the Dominion and although to the south of the line there may be some

THE CAPITAL FAVORITE



is a high class Family Steel Range adapted for either coal or wood. It is honorably built of the best material, and put together as tight as a steam boiler.

It has a roomy fire box for wood and the linings can be changed from wood to coal or vice versa without the disturbing of a bolt.

This Range is made of Heavy British Cold Rolled Non-Corrosive Polished Steel. It never needs black-leading, only an occasional light rub with a cloth will keep it clean and bright.

Lots of room on the top and in the oven to do the busy morning's work.

There are thousands of these Ranges in the homes of the best farmers in the country, giving absolute satisfaction.

Ask your dealer for **THE CAPITAL FAVORITE** and take no other.

Massey-Harris Cream Separator

The cleanest skimmer under all conditions—because it has greater skimming surface and because of the uniform distribution of the milk by the improved split wing.

Easy to Fill

Because of the low supply can.

Easy to Turn

Because milk is speeded up at centre of bowl, because of the easy-running ball bearings and because of the smooth running gears.

Easy to Clean

Because everything is easy to get at.

Self Balancing Bowl

Spins like a top at its own centre of gravity.

Patent Brake Attachment

Stops the bowl quickly.

The Massey-Harris Co., Ltd.,

Moncton, . . N. B.

Let us buy a 50-cent bottle of Psychine (pronounced Si-keen) from your druggist and give it to you (free) to prove its great value.

Psychine is the greatest vitality builder of the age.

For thirty years Psychine has been curing almost every disease that is due to run-down vitality.

Hundreds of thousands have used Psychine with wonderful beneficial results.

We have received thousands of unsolicited testimonials from people whom Psychine has cured, of in many cases, hopeless ailments.

There are still thousands of people suffering from disease, however, whom Psychine can benefit.

There are still thousands who are trying to cure themselves by wrong methods, who are using dangerous and hurtful medicines.

There are still thousands who are gradually losing their vitality—from whose body the necessary resisting power to disease is slowly but surely slipping away.

There are still those who soon will hear the dread "call in the night" if they do not take prompt action.

To these we have the above message, viz.:

"Let us buy a 50-cent bottle of Psychine from your druggist and give it to you, free, to prove its great value."

That 50-cent bottle of Psychine will tell you more powerfully than mere words can how tremendously beneficial Psychine will be for you.

It will give you an unmistakable indication of its wonderful power to renew the bodily vitality, to strengthen the phagocytes (the white corpuscles), the policemen or scavengers of the body.

* * *

The Surgical Department of the Japanese Army, in the Japo-Russian war, first drew the attention of the scientific world to the function of the white corpuscles of the blood or phagocytes.

Foreign medical men were astounded to see Japanese soldiers with wounds that had not been cleansed or dressed for days, that were apparently dirty, ill-kept, and altogether unsanitary.

Yet these dirty wounds healed marvellously; no army the world had ever known had such a wonderful record for the recovery of their wounded as the Japanese army.

And all because the Japanese knew how to let the white corpuscles cure.

* * *

There are two kinds of corpuscles in your blood, you know, red and white.

The red carry nutrition, the white are the policemen or scavengers of the body.

Whenever a disease germ enters the body, these white corpuscles attack and literally eat it.

A wound that attracts disease germs from the air is cleansed and healed by billions of phagocytes, or white corpuscles, devouring these unwelcome disease germs.

Any disease can be cured by these white corpuscles if they be in sufficient number or strong enough to attack and devour the germs that cause the disease.

If they are not in sufficient numbers or strength, then the disease germs eat them and disease claims the body.

That's the cause of every disease to which humanity is heir.

* * *

For centuries the cure of disease has been by means of herbs—nature's remedies.

It is only within recent times that we have come to know how these herbs act.

Now scientists tell us they increase the strength and numbers of the white corpuscles or phagocytes.

In Psychine we have some of the most healing and beneficial herbs in the world, herbs that increase and strengthen the white corpuscles.

From Arabia comes one herb, from South America another, China and Japan produce a third, while the jungle of India yields a fourth.

All these herbs are recognized by the medical profession as being the most beneficial to health that they know.

That's why Psychine, in the third of a century it has been made, has cured hundreds of thousands of people who suffered from the following diseases:

La Grippe	Bronchial Coughs
Bronchitis	Weak Lungs
Hemorrhages	Weak Voice
Sore Throat	Spring Weakness
Anaemia	Early Decline
Female Weakness	Catarrhal Affections
Indigestion	Catarrh of Stomach
Poor Appetite	Night Sweats
Chills and Fevers	Obstinate Coughs
Sleeplessness and	Laryngitis and
Nervous Troubles	Dyspepsia

After-effects of Pleurisy, Pneumonia and La Grippe.

That's why we believe it will be beneficial to you.

Now we don't ask you to take our word for the tremendously beneficial effect of Psychine. Fill out the coupon below, mail it to us, and we'll give you an order on your druggist (for which we pay him the regular retail price) for a 50-cent bottle of Psychine to be given you free of cost.

We will undoubtedly buy and distribute in this manner, hundreds of thousands of these 50-cent bottles of Psychine.

And we do that to show our entire confidence in this wonderful preparation.

A confidence that has been based on our 30 years' experience with this splendid preparation with a full knowledge of the hundreds of thousands of cures it has made.

COUPON No. 77

To the Dr. T. A. SLOCUM, Ltd.
193-195 Spadina Ave., Toronto.

I accept your offer to try a 50c. bottle of Psychine (pronounced Si-keen) at your expense. I have not had a 50c. bottle of Psychine under this plan. Kindly advise my druggist to deliver this bottle to me.

My Name.....

Town.....

Street and Number.....

There is a cause for this effect.
50c. a box at all dealers or upon receipt of price from
The Electric Bean Chemical Co. Ltd. Ottawa.

discouraging features in the general situation, nevertheless there may be much in the way of suggestion to be learned from that country. Further, trade relationships between the two countries must always be more or less intimate and as the United States, notwithstanding a severe duty, imports annually from Canada a gaodly quantity of wool, it would seem to be of direct advantage to have some specific information concerning the status of the trade in the former country and also as to its advisibility as a future market.

Canada has undoubtedly, wonderful possibilities and large opportunities in connection with the development of its sheep population. The present investigations have been undertaken as preliminary to the adoption of a permanent scheme for the encouragement and upbuilding of the industry. In the belief that Canadian agriculture must of necessity suffer severely while sheep remain so few in number in the country, the Minister and his officers will not be satisfied till statistics show a return of at least ten times the present estimate, and until sheep raising has established itself as a recognized factor in promoting the national prosperity.

Flushing the Ewes.

The extent of profit from a flock of sheep is very largely determined by the size of the lamb crop. If every ewe in the flock would produce one good strong lamb there would be profit in the business, but if in addition to this a quarter, a third, a half, or even more of the flock, would bring two instead of one, then profits would grow into very attractive proportions. Such a lamb crop is not beyond reason, and, in truth, is aimed at and frequently obtained by the best shepherds.

The size of the lamb crop is very largely regulated by the method of handling the ewes from weaning time till they are mated. Those who are most successful in obtaining large lamb crops each year practice a system in handling their sheep at this period called "flushing."

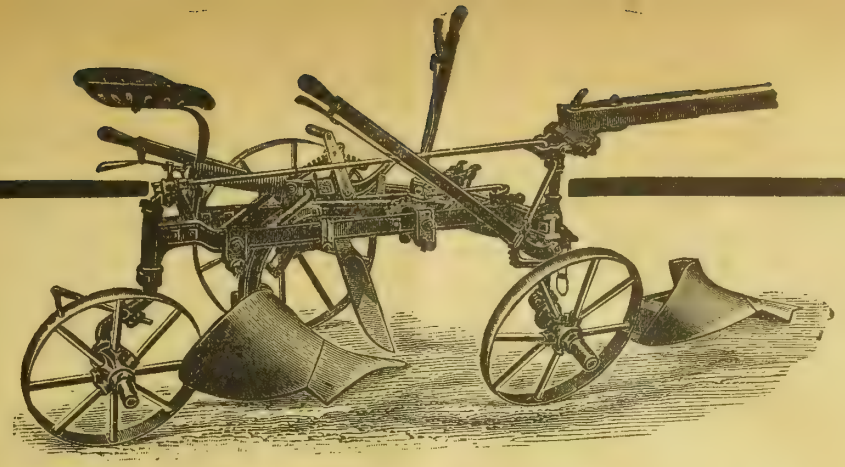
In this method, the ewes at weaning time are placed upon rather short, dry pastures, and are kept there for a period of about three or four weeks, the length of time being regulated by the contemplated time of breeding. This is, of course, of advantage in the quick drying-off of the ewes. They may be turned upon the stubble fields, where they can do valuable gleaning, and yet not obtain too much feed. It seems to be especially desirable fot these first few weeks that the sheep be not freely fed. This period of scanty food supply apparently puts the system into such a condition that the succeeding period of generous feeding may produce the most stimulating effects.

About three weeks previous to the time of mating the flock should be turned into an excellent pasture. For this purpose there should have been reserved for them a field in which the second growth clover has been allowed to come on unmolested. If this is not available a patch of rape should be prepared. It is most essential that the sheep have an excellent pasture at this time. There may be added to the grazing a slight grain ration, but it is not needed if the grazing is good. By this management of their feeding all the ewes will be brought into breeding season about the same time, thus dropping their lambs pretty well together, and scarce a ewe will miss breeding. In this way larger crops of lambs are regularly produced than has been obtained under any other method of handling the flock.

Dispersion Sale.

A dispersion sale of the entire herd of high grade Ayrshires owned by The Hampton Stock Farm, will take place early in November, the exact date will be announced in our next issue together with full particulars as to stock, etc. It will include several cows in milk and due to calve, 2 year old Heifers and 2 yearling Heifers, also 6 young calves. It is the intention to sell the entire stock without reserve so that genuine bargains may be expected. Look for announcement in next issue.

Chamberlain's Cough Remedy has become famous for its cures of coughs, colds, croup and influenza. Try it when in need. It contains no harmful substance and always gives prompt relief. Sold by all dealers.



Cockshutt's New Footlift Sulky.

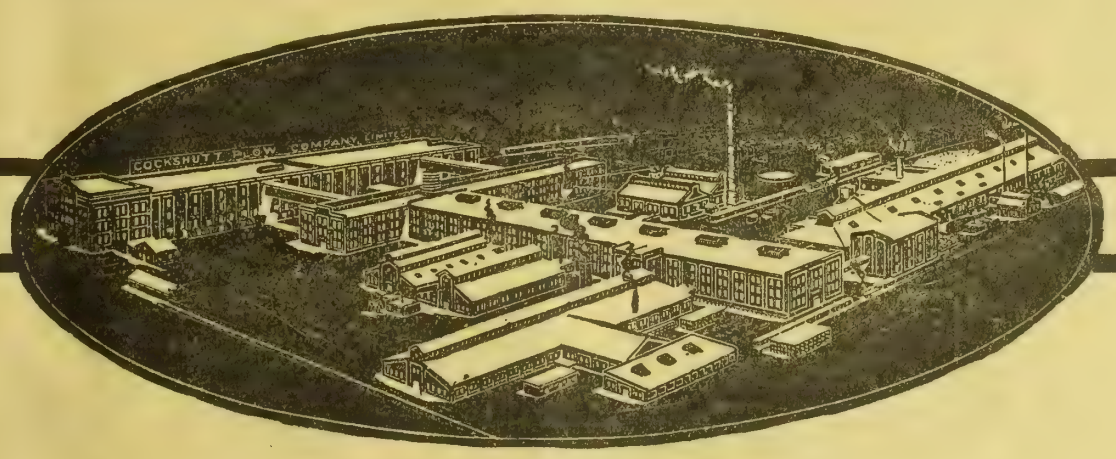
Showing Wide and Narrow Bottom

Built to stand all Conditions. A Boy can handle it

THIS Footlift Sulky is a great favourite with farmers in Ontario and the Maritime Provinces. In design, it is very much like our Jewel Sulky, which has become the standard of Sulky Plows in Western Canada. It can be fitted with bottoms suitable for any kind of soil—for clay land the Judy bottom is used, and for loamy soil the No. 21. These bottoms have already made a great name for themselves, and farmers know of them so well, that detailed description is unnecessary. But what places this Sulky plow in a class by itself—makes it distinctive and better than any other make—is the Footlift Attachment, making it so simple to operate, that any boy who is able to drive a team of horses can handle it.

The levers are all conveniently arranged, but are only used for adjusting the plow when starting in the field, for once it is set to width and depth it is operated entirely by the footlift attachment, leaving the operator's hands free to manage the horses. A special device locks the plow when raised from the ground and locks it down when set for work. The plow can be raised by the footlift attachment when obstructions are met with, preventing breakage, which is very useful in stony land. Can be fitted with rolling colter, knife colter or jointer.

This Footlift Sulky embodies every requirement necessary for plowing any kind of soil, and the farmer who buys one will be investing his money where it will bear good interest. Another point—when the operator jumps off this plow at night, he won't feel tired out, but will be well able to do his chores.



Will You Do This Now—To-day?

YOU have probably read about the reliability, durability and efficiency of Cockshutt implements in this paper scores of times, but reading about these things is poor satisfaction, if you have never had an opportunity of testing the implements themselves.

We are constantly receiving letters from farmers along these lines—"If I had only known how good your 'so-and-so' was, I would have bought one years ago."

The farmer who buys an implement bearing the name "Cockshutt," not only realizes that he has got honest value for his money, but after putting it to every test, he feels that he should write and tell us how delighted he is with his bargain.

WRITE FOR CATALOGUE TO-DAY

And you will be no exception if you invest your money in any Cockshutt product, whether it be a Plow, a Drill, Cultivator, Harrow or any of the numerous implements which we manufacture.

There is a Cockshutt dealer in your neighbourhood, who will gladly show you our line of goods, but the first step you should take is to get one of our new Catalogues.

Write us to-day and we will send you one by return mail.

COCKSHUTT PLOW COMPANY LIMITED BRANTFORD

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Mrs. Bowen's Investment.

(Continued from last Issue.)

"Very well, Mary Jane, tell your mother that I shall expect her." And, as the hall doar closed on the juvenile messenger, she added: "I must put off my ironing till to-morrow, that's all, Hannah, and make some. cake. You can do yours just the same, only I didn't want to have to take you off to go to the store this morning, since Johnny got the butter and eggs; but there isn't a bit of lard in the house, and we are out of brown sugar, and Mr. Gerry is so fond of short biscuit. He always expects some kind of meat, so you'll have to stop at the butcher's and tell him to send a small steak. Oh, and I used the last of the tea this morning, all but a small drawing, but it won't be enough for all those people."

"Bringing their young ones along", said Hannah, spitefully. "Tney'll eat enough for an army. Just about as much consideration as some folks have. 'Tain't no wonder they never get a girl to stay with 'em. Well, if I've got to stop and go, I s'pose I might as well be a-goin'.

Hannah's unusual alacrity was some relief to the pressure of affairs, but it was accounted for when she returned, after an absence of twice the usual length.

"I thought as the clothes wasn't done, I might jest as well stop to Miss Taylor's and have my new dress tried on; and she found she hadn't got quite enough trimming, so I just run down to Tripler's and matched it. Didn't take me five minutes, and I knew I shouldn't get out to-night, with all them people here to tea."

There was nothing to be said, and no time to send back for saleratus or white sugar, both of which were found "low." Mrs. Bowen was obliged to make her cake of the brown and had the mortification of finding it heavy. The saleratus did not prove sufficient for the two pans of biscuit—there must be two pans, as the children were coming—and what with the damp clothes, and wasted morning, and the interruptions of the baking, the ironing had made slow progress when Mrs. Gerry arrived, punctually at three o'clock, and Mrs. Bowen felt very little like giving up the afternoon to her entertainment. It was a very fatiguing business, for the visitor was one of those ladies who never suggest a topic for converstion, and consequently long pauses intervene, when the other party feels herself exhausted; and then, too, Mother Bowen who was fond of company, but whose hearing was impaired as well as her digestion, requested to have each particular remark repeated in a very loud tone. The little boys came from school with Kate, and made so much noise that it was next to impossible to hear one's self think, besides distracting attention to the way they had of handling and looking into everything, much to the detriment of the articles so examined.

"Ah, good evening, Mrs. Bowen. Just in time, I see"—for, with Mr. Gerry's arrival, an appetizing odor of steak was diffused through the sitting room. "I've saved my appetite; I always do when I am coming here. I tell mother that it would be a sin and a shame to spoil one of Mrs. Bowen's good teas by eating any dinner beforehand. How d'ye do, Bowen, how d'ye do? Supper is just coming in, you see. Where shall I sit? Anywhere. You don't make a stranger of me, you know."

"Not commonly." And Mr. Bowen who liked his guests, and had a sharp appetite for his share of the good things provided on their account, drew the steel across the carver with an air of keen expectancy.

"That's just what I said to mother this morning, when we proposed coming over here tonight. 'It's ironing-day,' says she, 'and I don't know as it will be convenient for Mrs. Bowen. 'Oh, la,' says I, 'they never put themselves out of the way for us; go when you will,' says I, such a first-rate cook as Mrs. Bowen wouldn't mind; always sure to have something on hand.'"

Mrs. Bowen reflected on her neglected ironing, her hurried, fretted day, and indiciously busied herself with the tea things. She could not quite make up her mind to assent. with the cheerfulness it seemed to demand, to Mr. Gerry's statement.

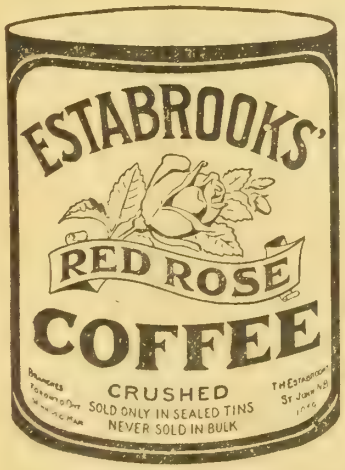
"Do make yourself at home, and pass the biscuit," said Mr. Bowen, to cover this little backwardness. "Have a biscuit, mother? Help yourself to butter, Mrs. Gerry.

"I'll have some cold bread, Eliza." And Mrs. Bowen's worst fears were realized by the expression of her mother-in-law's face when she said it. "It's as much as my night is worth to tech one of them biscuit; they're jest as heavy as lead."

(To be continued.)

Blending coffee

is a fine operation requiring highly developed skill. The secret of that unusual richness and briskness in Estabrooks' Coffee is in the perfect blending of strength and flavor. It is a coffee for particular folk.



Sold only in 1 and ½ lb. tins.

St. John, N. B.

SEALED TENDERS addressed to the undersigned, and endorsed. "Tender for Public Building Campbellton, N. B.," will be received at this office until 4 00 p. m., on Tuesday, October 18, 1910, for the construction of a Public Building at Campbellton, N. B.

Plans, specification and form of contract can be seen and forms of tender obtained at the office of Mr. D. H. Waterbury, Clerk of Works, Custom House, St. John, N. B., on application to the caretaker Post office, Campbellton, and at this Department

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, made payable to the order of the Honourable the Minister of Public Works, equal to ten per cent. (10 p. c.) of the amount of the tender, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, September 22, 1910.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

A Creed.

To be earnest; to be strong;
To make light the way with song;
Slow to anger; quick to praise;
Walking steadfast through the days.
Firm of purpose, sure of soul,
Pressing onward to the goal,
Upright, even, undismayed,
Sure, serene and unafraid.

To be patient; to be kind;
To be purposeful, and find
Sweetness all along the way;
Loath to judge, but firm to say
Truth with unrelenting tongue;
By no cavil veered or swung
From the right; and to endure
Hopeful, helpful, clean and pure.

To be gentle; to forgive;
True to life and glad to give;
To be watchful and to be
Rich with boundless charity;
To be humble in success,
Strong of heart in bitterness,
Tender, gracious, thoughtful, good
In our man-and-womanhood.

To be smiling; to be glad
For the yesterdays we've had;
To be grateful all the way
For the beauties of today;
To be hopeful and to see
In the days that are to be,
Bigger, better, broader things
Robes of purple, crowns of kings!

N. D. Bismarck.

Morals and Manners.

Cleanliness is next to godliness.
The apparel proclaims the man.
Speech is the index of the mind.
Clean linen gives moral strength.
True delicacy is solid refinement.
A loud voice bespeaks a vulgar man.
Good taste is the flower of good sense.
Refinement creates beauty everywhere.
If a man be a fool his speech will tell it.
Slovenly attire betokens a careless mind.
A foolish woman is known by her finery.
Excessive laughter shows a shallow mind.
Beauty without grace is a violet without scent.
He is the best dressed whose dress no one observes.
The power of dress is great in commanding respect.
The manner of speaking is as important as the matter.
When the taste is purified, the morals are not easily corrupted.
Laughter costs too much if it is bought at the expense of propriety.
Such as are careless of themselves can hardly be mindful of others.

Household Suggestions

A moderate oven is one in which a piece of white paper will become golden brown in 12 minutes.

A convenience and economy for the oil or gasoline stove is a three part cooker which can be used over one burner. The parts are separated so that three articles can be cooked at the same time.

Rinse out the dish cloths frequently and let them bleach on the grass in the sun to keep them sweet. There is nothing like the sun as a purifier. Use it lavishly and your health will be better and the house purer.

To relieve ear ache, irrigate the ear with warm water. Arrange the patient so that the water can run out of the ear into a receptacle or into cloths which will absorb it. Have the water of slightly more than tepid warmth and allow it to run slowly into the ear until relieved. Cover the ear afterwards with warm woolen cloths.

An Object of Pity

That part of our nature which we call the emotional is much more highly developed in women than in men. They are more sensitive, more tender, more sympathetic, more pronounced in their likes and dislikes, more susceptible to the extremes of pleasure and pain; and these refined mental qualities, no less than beauty of form and feature, make up the atmosphere of attractiveness and charm which always surrounds true womanliness.

The continued existence of these winning, engaging womanly characteristics depends to a very large extent on the regularity of the womanly functions and the condition of the womanly organs; and when these functions and organs become disordered or diseased the same mental qualities which are the glory of a well woman become the source of suffering and torture almost indescribable. Her cheery hopefulness is changed to a feeling of despondency, almost of despair, and she is haunted with forebodings of worse evils to come. Instead of being entertaining and companionable, she becomes moody and irritable, being unable to keep her mind from dwelling on her troubles. She becomes morbidly sensitive, imagining that she is being slighted or foresaken by her relatives and friends and she has a most humiliating sense of her miserable condition and of her loss of her womanly attributes. If she is religiously inclined she is very liable to be oppressed with doubts and fears in regard to her spiritual condition, or to think that she is eternally lost. In addition to this, she has also to endure the most distressing aches and pains.

What makes the case still more pitiable, especially with married women, is the fact that few men understand or appreciate the extent of their suffering, or the seriousness of the troubles causing it. Many doctors even speak of these disorders as subjects for ridicule, and the poor sufferer often gets a reputation for being a crank or a scold when she more nearly approaches being a martyr.

As these disorders are due to a disordered condition of the womanly organs, it is evident that to effect a cure these organs must be restored to normal condition; or, in other words, the circulation, which has become congested and stagnant in these parts, must be improved so that the waste matter will be expelled, and the nourishment so badly needed be brought to these suffering organs. It is the waste matter, or broken down tissue, which is held in the stagnant blood vessels in these parts, that causes most of the suffering by oppressing the nerves located in these parts.

The remedy known as ORANGE LILY will positively relieve this congestion and restore normal circulation in the disordered organs. It is an applied or local treatment, and acts wholly on these parts. It is absorbed into the blood vessels in these organs, and as it has powerful antiseptic properties, it immediately acts on the waste matter held there, and causes it to be discharged. As this dead matter is discharged the nerves are relieved, the pains and mental troubles become less, and the nerves and blood vessels become stronger. ORANGE LILY thus proves its merit by actual, visible results. It acts as certainly and as positively on all female troubles as anti-toxin does on diphtheria.

Winnipeg, April 28th, 1909.

Dear Mrs. Currah,—I am very grateful to ORANGE LILY for the change it has made in my life. When I commenced its use eight months ago I felt I would be surely insane before the year was ended. The pain I suffered often made me wish for death, and besides I would have such fits of depression and nervous twitching that I would have to scream. I had doctored with three different doctors for over two years, and had also used both the Pierce and Pinkham medicines, but none of them seemed to reach my case. I felt some improvement after the first month's use of ORANGE LILY and have kept gaining ever since. I do not feel that I am entirely cured yet, but I am so much better than I was that I am sure I will soon be entirely well. I sleep well, and feel cheerful and happy, except that I am occasionally somewhat depressed, but these spells are getting fewer and milder. I have also noticeably improved in appearance. Enclosed find $3 for which please send me two boxes of ORANGE LILY and one of Cerate Massage. I might add that the matter which used to be freely discharged, and which looked like a chicken's gizzard, is becoming very scant, and I imagine that the circulation is pretty well restored. Am I not right in this? Your sincere friend, MRS. L. E. A.

Free to all Sufferers

In order to enable every woman suffering from any form of female disorders to test the merits of ORANGE LILY, I will send to everyone who will send me her address, or the address of any suffering friend enough of the remedy for ten days' treatment, absolutely free. As this is worth 35c. it is only because I know that it must give relief that I make this free trial offer. Further, if any woman wishes expert medical advice, and will write me a full description of her case, I will submit same to the staff of the Coonley Medical Institute, Detroit, Mich., and they will write her direct without expense to her. INCLOSE THREE 2-CENT STAMPS and address MRS. FRANCES E. CURRAH, WINDSOR, ONT.

Convention For Farmers' Wives.

For some months I have been cherishing an idea that I should like to bring before the Editor and readers of the Farmer. It is something that appeals to me as being worthy of agitation. Something that largely affects a class of workers, that need an intellectual awakening.

It is just this—why can't we farmers wives have a Convention? Why can we not be progressive in our sphere? There are a thousand and one things that could be discussed with both profit and pleasure. Every up-to-date woman is open for improvement, and the farmer's wife, especially needs to be alive to all her advantages and opportunities. Now the trouble with us is, we live too much in the material side of life, and not enough in the ideal. This makes us too sort of ordinary. Let us get out of it. We should learn to live mentally, that which we wish to make real and the struggle for existence should not elinimate all higher aspirations.

If even ten good capable women would fall in with the idea of annual convention, talk and plan and work for its legitimate culmination, it would surely materialize. I have learned that there is a tremendous power in the habit of expectancy, the belief that we shall realize our ambitions. If we begin now to agitate this matter, and if the idea falls on fruitful soil, perhaps in six months we could get up a splendid convention. What we try persistantly to do, we tend to achieve, even though it may not seem likely, or even possible.

If there are just enough of us to take hold of this question, keep the desire alive, write about it, talk to your friends of it, the constant effort will increase the possibility of realizing what is now only a vision. I wish the editor would get after us—tell us we are the most pessimistic lot—tell us anything to arouse rebellion and see if it would not bring into action minds that are long since dormant—pens also.

Besides being a practical help, a convention would be a nice little outing, a promoter of sociability, a renewal of old time acquaintances. Life is monotonous to the most of us, and something like this would be like a rift in the clouds.

Now, ladies, if there is a commendable idea in this short article, please help to keep it in progress and in the next issue may we hear from you. In the meantime bear in mind that—

"The thing thou cravest so, waits in the distance,
Wrapt in the silence, unseen and dumb—
Essential to thy soul and thy existance
Live worthy of it, call and it shall come."

Sour Cabbage.

Shave cabbage very fine and cook till tender, then drain thoroughly. Mix together one beaten egg, one-half cup vinegar, one teaspoonful salt, one level teaspoonful mustard. Blend well and add to the cabbage. Heat all well, but do not allow it to boil. Add a small piece of butter and just before serving add one-half cup of milk, beat and serve.—J. W.

Perpetual Youth.

Let Me Tell You How to Regain All Your Old Vim, Vigor and Manly Strength. Be a "Health Belt Man;" Feel Young for Balance of Your Life. Age Doesn't Count if You Have the Vitality.

"I could shout for joy. After years of Weakness and Debility, your Wonderful Health Belt cured me. I am a man again. Use my name as you see fit."

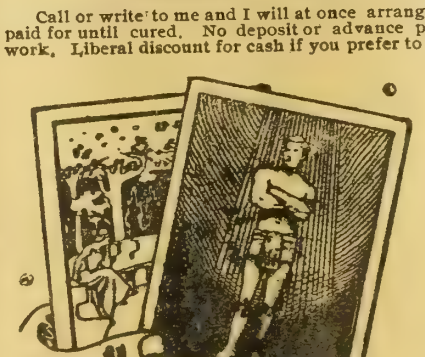
Leon Turpinat,
Stellarton, N. S.

Perpetual youth. That is precisely what I mean. I say as man to man give my Health Belt a reasonable chance and it will carry you through any business, mental or physical strain you may be under. It doesn't stimulate; it simply adds the electro-tonic element to your bone, nerves, tissue and blood; all the force and strength which has been drained from your system by some earlier indiscretion. My Health Belt is essentially a strength giver. It overcomes the private symptoms of weakness in men which sap the vitality. If you are nervous and lack manly vigor, you are passing away thousands of brain cells every day. Ask your physician if this is not true. I stop this awful weakening process. You wear my Health Belt nights; while sleeping a great stream of soft electricity passes into your body at the small of the back; it cures backache in one application; you feel better immediately; inside of an hour; two months will make a new man of you. No drugs, no privations; no restrictions except that you must give up all dissipation. Follow my advice and I promise you will feel younger and look younger. Let me restore your vitality, and you will be able to face the world with new ambitions. The Health Belt cures other ailments too. A positive remedy for rheumatism in any part of the body, sciatica, lumbago, kidney, liver, stomach disorders.

Special attachments furnished, and worn by women as well as men.

FREE UNTIL CURED.

Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.



Let Me Send You These Two Books FREE.

They fully describe my Health Belt and contain much valuable information. One is called "Health in Nature" and deals with various ailments common to both men and women. The other, "Strength, the Glory of Man," is a private treatise for men only. Both sent upon application, free, sealed, by mail.

If in or near this City, take the time to drop in at my office that you may see, examine and try the Belt. No charge for professional advice either at my office or by mail. If you cannot call, fill in the coupon and get the free booklets by return mail. They are better than a fortune for anyone needing new vigor.

lowed in second and third places by Lord Dalmaney and Norseman.

Baron Belgradden had no competition in the two-year-old stallion class.

Logan Bros. led the way in the one-year-old stallion class with Labori Again, by Handy Andy, out of Soubrette, the sire and dam of the first prize foal of 1910. The second prize yearling stallion was Chatham Fame by, Scottish Fame, out of Marinette, the second prize brood mare and dam of the third prize foal. Snowball's May Lothian, the dam of the first prize foal, stood at the head of the broad mare's class and Starr's Juliette stood up for third money. Logan Bros. had no competition in the 4-year-old filly class; their Pink Rose and Polly McGregor were awarded first and second prize monies, respectively.

C. R. H. Starr & Son, had the first two-year-old filly, Lady Ronald, by Montrave Ronald, and with her captured the coveted diploma for best mare any age. Logan Bros., had two close competitors for the class honors in Baron's Fancy, by Baron Pansy, out of Pink Rose and Princess May, by Sir Simon, out of Soubrette, a daughter of Labori.

The first honors in the yearling filly class went Starr's Juliana, by Baron Primrose, out of Juliette, while Logan's Homestead Rose, by Handy Andy, out of Pink Rose, stood in second place. Baron Primrose captured the diploma and silver cup, for best stallion, any age, as well as diploma for stallion and three of his get.

The contest for the J. P. Fairbanks silver cup, for the best five horses, any breed, owned by the exhibitor, three of which must be registered, brought out three splendid lots. The trophy went to C. R. H.

B
"Why Don't You Use
Amatite
ROOFING?
It Needs No Painting!"
EVERYTHING about Amatite appeals to the man with common sense. He can see its superiority at once—the *real mineral surface* which never needs painting; the *two layers of Pitch* which is the only imperishable waterproofing known; the two layers of *heavy Tarred Felt*—all these contribute to the popularity of Amatite.
We can make Amatite better and cheaper than anyone else on account of our greater facilities, and consequently we sell it at a surprisingly low figure.
Simply the fact that it *needs no painting* is enough to make a man sit up and take notice—especially the man who has spent dollars and days in painting and repainting his smooth-surfaced roofings.

Pinkey were out with two good herds of Devons. Chas. G. Pinkey's aged bull Prairie King, won the championship for best bull, any age, as well as diploma for bull and three of his get.

Wm. A. Pinkey's Grace S., shown in the four-year-old cow class, was the champion female, while his Dawn of Springdale, another aged cow, was at the head of the section for cow and two of her progeny.

In the hauling contest conducted before the grand stand, on the after-

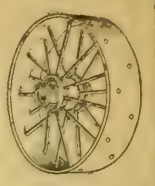
Work and Worry Saving Wheels and Wagons.

Get a Dominion--utmost strength—least draft—low-down for handy loading—buy themselves every year—last a lifetime.

Cost Little—Last Long.

Put our wide-tired, take-apart, never-wear-out-wheels on all the wagons you now own. Won't clog on muddiest roads. Stand any strain; proof against frost and breakage. Saves you work and horse-power. Priced fair. WRITE US TO-DAY.



Tudhope-Knox Co., Ltd., successors to Dominion Wrought Iron Wheel Co., - - Orillia, Ont.

Starr & Son, closely followed in second place by Logan Bros, with an even lot of three aged mares and two two-year-old mares. R. A. Snowball was the third competitor.

PERCHERONS.—Frank Ellis, Wittenburg, N. S., showed Aubin and W. A. McManus, Upper Stewiacks, showed Massol, in the aged stallion section of the Percheron class, and won the red and blue ribbons in the order named. Chas Symes had the only yearling stallian, Lord Roberts, and the only four-year-old filly, Distinguee. Aubin was the best stallion, any age. There were no entries in the other sections of this class.

BEEF CATTLE

were not out in very strong numbers but the quality was good. There were only a very few poor specimens in the lot.

SHORTHORNS.—C. A. Achibald and R. A. Snowball were the only competitors, in the Shorthorn class. There was no competition in any one of the bull classes, except in the junior calf class, where Chatham Sailor won the red ribbon from Wood King II., a Huntleywood calf. Archibald's Orange Prince, shown in the aged bull class won the diploma for bull, any age. R. A. Snowball showed Dunrobin Sailor, Scottish Clipper and Valiant in the two-year old, senior yearling and senior bull calf classes, respectively. Archibald swept the board in the aged cow and three-year-old cow classes with Merry Maid III, Merry Maid, Roan Lady, Katrina of Bellevue, Lady Roan and Rosabella. In the two-year-old heifer section, Archibald's Merry Maid V. mounted to the head head of the class and was followed in second and third places by Snowball's Lady of the Snow and Chatham Lass. Archibald again had winners in the senior and junior yearling heifer classes in Mermaid, and Merry Maid V, daughters of Merry Maid.

Snowball had everything his own way with senior heifer calves and Archibald had a like, easy snap in the junior heifer calf class, where he showed a Rosabella calf. Archibald's Merry Maid IV. captured the diploma for female any age. The first and second prizes on best three animals the get of one bull went to Archibald on the get of his old bull, Huntleywood.

Merry Maid and Merry Maid III., were the dams of the first and second prize winners, in the section for best two animals, progeny of one cow. The first prizes on young herd and on graded herd went to the Archibald herd. The second honors in these sections went to the Snowball herd.

HEREFORDS.—Every prize in the Herford class went to W. W. Black, with the exception of first prize on senior yearling bull, which was captured by Wm. O'Brien & Sons with Ben Butler, a very promising youngster, and third prize on aged cows, which went to Wm. Robertson, Amherst, N. S. The champion bull, in this class, was Rupert Ingleside IV. and the champion female was Sylvan of Amherst. The whole herd was uniform in quality and well fitted.

DEVONS.—Wm. A. and Chas. G.

Do You Realize the Advantages of Concrete?

This Book Tells How Concrete Aids Farmers.

THE rising price of lumber has compelled the farmer to look for a suitable substitute.

Concrete, because of its cheapness, durability and the readiness with which it can be used for every farm purpose, has proven itself to be cheaper than lumber and far more durable. Our Free Book—

"What the Farmer Can Do With Concrete"

shows the farmer how he can do his own work without the aid of skilled mechanics. It demonstrates the economy of Concrete construction as compared with lumber, brick or stone.

It shows how Concrete can be used to advantage on the farm in the construction of almost every practical utility.

Send for this book to-day. You'll find it intensely interesting, even if you don't intend to build for a while. It contains much useful information that will put you in the way of saving money. Among the subjects treated are: Barns, Dairies, Fence Posts, Feeding Floors, Hitching Posts, Root Cellars, Silos, Stables, Stairs, Stalls, Troughs, Walks, Well Curbs, and so forth.

REMEMBER.—This book is yours—a postal will bring it promptly. Write now.

You may send me a copy of "*What the Farmer Can Do With Concrete.*"

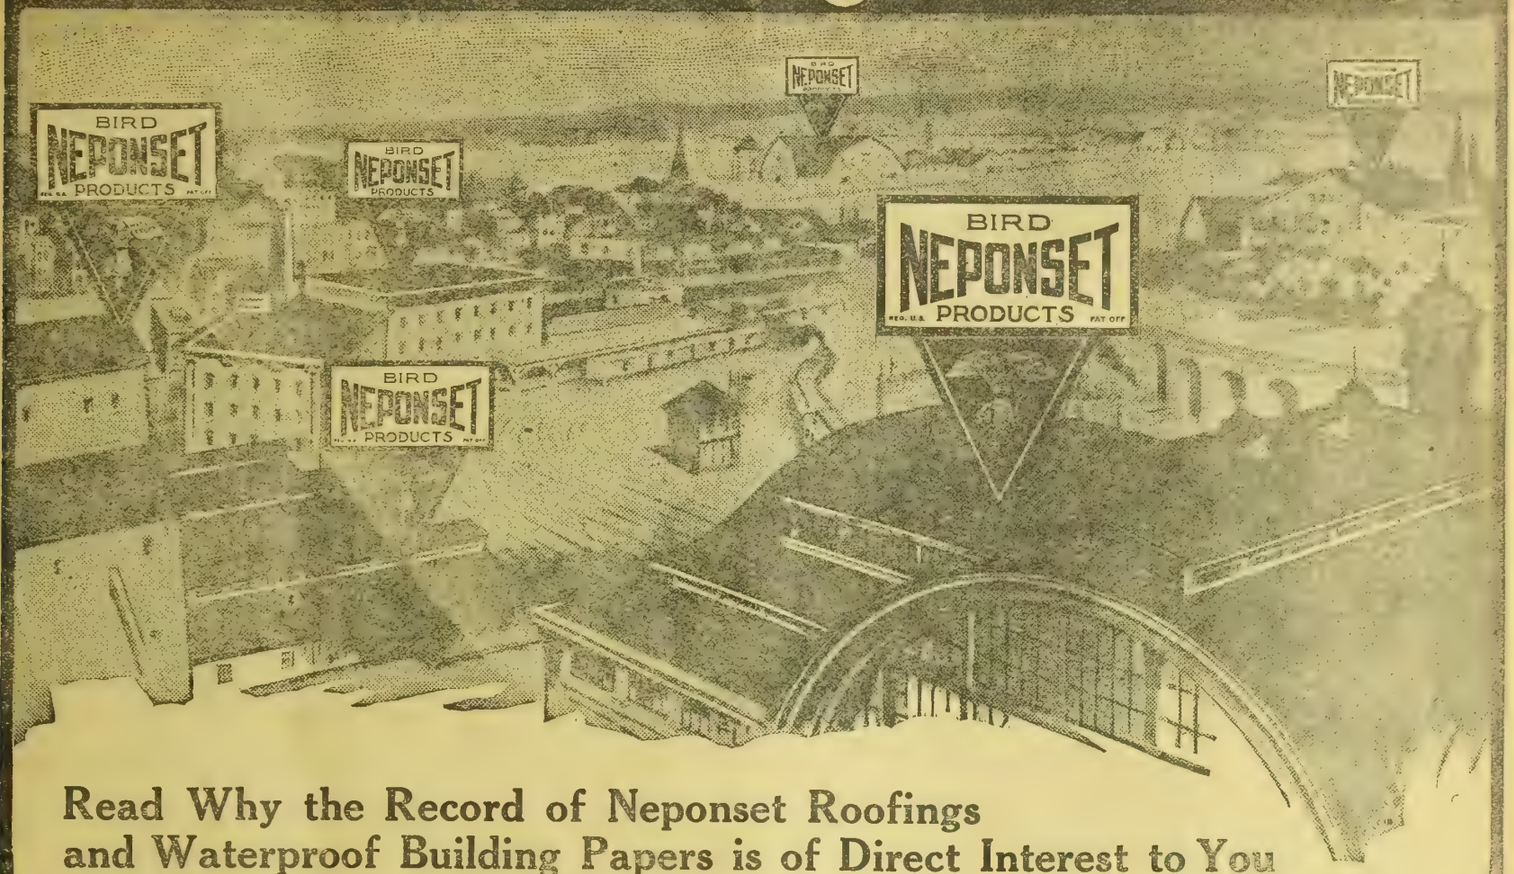
Are You Going to Build?



Read Why the Record of Neponset Roofings and Waterproof Building Papers is of Direct Interest to You

During the last twenty years the great Railway systems of this continent have bought over 75 million square feet of Neponset Roofings in addition to other Bird Neponset Products.

In the same period in Canada and the United States the Departments of the Government, Manufacturers, Farmers and Poultrymen have used many million square feet of Bird Neponset Products.

For a quarter of a century, leading architects and engineers have specified Neponset Waterproof Building Paper. It is the recognized standard for high-grade work. Over 75% of the refrigerator cars built in this country are insulated with Neponset Insulating Paper.

Two Hundred Million (200,000,000) Square Feet of Bird Neponset Products Sold in 1909

Bird Neponset Products will do for you what they have done so long for thousands of others.

Whatever class of buildings you are interested in, whether it be dwelling, factory, train-shed, grain elevator, barn or poultry shed, there is a Bird Neponset Product you should know about. There are special Neponset Roofings for different types of buildings and special Neponset Waterproof Building Papers for every building purpose.

Bird Neponset Products are manufactured by a firm that has been in one line of business for one hundred and fifteen years. Starting with one small mill in 1795, we now operate three large plants in the United States; two in Canada, sales offices and warehouses in both countries and agencies in all parts of the world.

We are the originators of the Ready Roofing idea and are the only manufacturers who make the entire product from the felt to the fixtures.

Bird Neponset Products are made from the highest grade materials by experts long trained to their task and tested and retested at every stage in the manufacturing process. That is why they yield most service and wear the longest.

Our claims for Bird Neponset Products rest on proof.

In every part of the country we can point to buildings which demonstrate all we claim. Test this for yourself by being shown in your vicinity a Neponset Roofing of the character you require. See for yourself exactly what you may expect of a Bird Neponset Product. Talk with the owner of the building, learn what he has found by actual experience.

Bird NEPONSET Products

Roofings and Waterproof Building Papers

NEPONSET Proslate Roofing: For roofs and sides of residences, club-houses, and all other buildings requiring artistic roofing and siding. Rich brown in color. Looks like shingles, wears like slate. Suggestions furnished for making buildings more attractive with Proslate.

NEPONSET Paroid Roofing: For roofs and sides of farm, industrial and railroad buildings. Slate in color. Has proved its worth by years of use, in all climates. Endorsed by the National Board of Fire Underwriters for its fire-resisting qualities.

For poultry buildings, brooder houses, sheds and temporary buildings, **Neponset Red Rope Roofing** is unequalled. It has been the standard low-cost roofing for 25 years, lasts three times as long as tarred felts.

NEPONSET Waterproof Building Paper: For use in residences under clapboards and shingles, in the walls, or under slate, metal, tile and similar roofs. Saves one-third the fuel bills every winter and prevents damp walls and draughts.

NEPONSET Florian Sound-Deadening Felt: For use in residences, under floors, between partitions and under metal roofs. Based on the dead-air-cell principle, it is the most effective muffler of sound and entirely sanitary. It is vermin proof.

NEPONSET Waterdyke Felt: For waterproofing foundations, bridges, tunnels, etc. Specified by all the foremost architects and engineers.

ARCHITECTS, ENGINEERS AND OWNERS are invited to consult with our Engineering Department upon any waterproofing problem they may have to solve. Write us and we will send one of our experts to the office.

OUR BUILDING COUNSEL DEPARTMENT is placed at the disposal of anyone that is building or repairing. Give us full particulars and we will gladly give you expert advice on any roofing or waterproofing question.

noon of October 4th, Charles G. Pinkney captured first money from three teams of Shorthorn oxen with his team of bulls, Prairie King and Melburn King.

DAIRY CATTLE.

The competition in the dairy classes, particularly in Ayrshires, Holstein-Friesian and Jerseys was keen and it took the judge a long time to place the awards, in some sections, as there was so much uniformity of quality.

A noticeable improvement is seen, every year, in Maritime dairy herds, and many fine individuals of dairy capacity were shown.

AYRSHIRES.—M. H. Parlee and McIntyre Bros., were over, from New Brunswick, with two magnificent herds of Ayrshires to compete with C. A. Archibald, C. P. Blanchard and Retson Bros., of Truro, and John McDonald & Sons of Shubenacadie, N. S.

bull section, with Morton Main's bull section, with Morton Mainjs Gurthrope, the unbeaten winner of male championship, and was closely followed in second and third places by Parlee's Lord Dudley of Spruce Grove, and McIntyre Bros.' White Hill Sunrise. There were five bulls in the class and the judge remarked that it was one of the strongest classes of bulls he had ever seen. They were all good bulls.

McIntyre Bros. had the only senior yearling bull, Sunshine of Spring Brook Farm. They also led the way in the junior yearling bull class with their imported bull Grange Kelly. Parlee's Morton Main's Amanth was second in the class and John McDonald & Sons had the third prize winner.

Archibald led the way in the bull calf classes. Parlee had the second prize winner in the senior section and McIntyre Bros.' Blanco of Spring Brook Farm came in for third money. McIntyre's Comet and Star, a pair of twin bull calves were second and third prize winners in the junior bull calf class.

Barleith Pompadour III, Morton Main's Lady Nelly and Dalmusternock Annie Laurie, owned by M. H. Parlee, McIntyre Bros., and Retson Bros., won first, second and third places, respectively, in a class of ten tried and true cows, the former winning the diploma for best female, any age. Parlee again mounted to the front in the three-year-old cow class, with Spruce Grove Senorita, while John McDonald & Sons' Emma, and Retson Bros., imported Sunshine of Broadmoss carried off the blue and white ribbons in a class of nine good ones.

C. P. Blanchard had the best two-year-old heifer. McIntyre Bros.' Orange Lily was the next best in this section and Retson Bros.' Gardrum Wee Nan, an imported heifer, captured the third award.

McIntyre Bros led the way in the senior and junior yearling heifer sections with White Lady I. and Rose of Spring Brook Farm. C. A. Archibald won the blue in both of these sections and Parlee had the third prize winners in Maple Grove Senorita and Maple Grove White Craig.

Maple Grove Fairsmile II, East Court Annie Laurie and Bessie of Spring Brook Farm, from the Parlee, Retson and McIntyre herds, respectively, won out, in the order named, in the senior heifer calf class. McIntyre Bros., C. A. Archibald and M. H. Parlee stood in first, second and third places, respectively, with heifer calves.

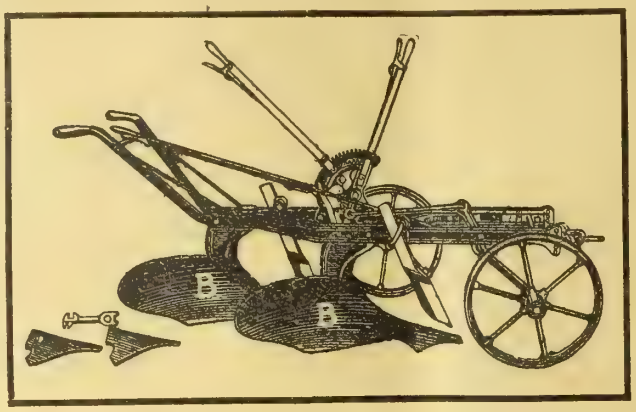
Archibald's champion bull, Morton Main's Gurthrope was first with three of his get and McIntyre Bros.' White Lady captured the diploma for cow and two of her offspriog, in competition with three other good ones. Four aged herds and four young herds faced the judge. Parlee, McIntyre Bros., and C. P. Blanchard stood in their respective order with good uniform herds, in the aged class. In the young herd class, McIntyre Bros., M. H. Parlee and C. A. Archibald were the winners.

JERSEYS—H. S. Pipes & Son, Josselyn & Young, Robert Robinson and J. E. Baker & Sons were out with some grand Jerseys. Pipes had the first and third prize aged bulls, in Imported Fereor and Brampton Financier, while Josselyn & Young's Foxhall, St. John O'Dreamwold captured the blue ribbon. Robert Robinson's Fontaine of Meadowview and Bonnie's Foxy had no competition in the two-year-old section.

J. E. Baker's Hillside Hall won the red ribbon in the senior yearling

This Two-Furrow "B" Plow Will Cut Your Plowing Right In Half

WITH two horses and this Two-Furrow "B" Plow, one man can do as much work in a day as two men and four horses can do with two ordinary walking plows. That's in stubble land; even in sod, you need only one extra horse — and save a horse and a man.



Now, note the special, improved features of this time-saving plow; it has a high lift to facilitate transportation; the standards are very high to prevent clogging in stubbles; the frame is made in three sections and very strongly braced, there are double adjusting levers — very long and very handy; there is a straightening lever to adjust width of furrows; the wheels have roller bearings in sand-proof hubs—the draft is reduced by half; the clevis is adjustable for two or three horses; the mouldboards are tempered as hard as glass — soft-centre steel—light draft and always clean; rolling colters when desired. The total weight is only 325 pounds! We would like to tell you more about this plow and other "B" Plows. **If your dealer cannot supply you, send us your name and address and we will give you the full information. Write to-day.**

Make Them Sound

A lame horse is a dead loss. Spavin, Curb, Splint, Ringbone, Swollen Joints and Bony Growths won't cure themselves. Yet you can cure these troubles and make your lame horse sound with

Kendall's Spavin Cure

just as thousands have done, and are doing today.

In the 40 years that this world's famous remedy has been on the market, Kendall's Spavin Cure has saved millions of dollars to horse owners.

Mounds, P.O., Olds, Alta.

"I have used Kendall's Spavin Cure for a number of years with great success, and I think it can't be beaten as an all-around stable liniment for Kicks, Strains, Swelling of all kinds, Ringbone and Spavin".

ARTHUR FLETCHER.

No telling when you will need it. Get a bottle now—$1—6 for $5.

ALL MY PIMPLES GONE.

Girl Tells How a Blotchy Skin Was Cleansed by a Simple Wash.

"I was ashamed of my face," writes Miss Minnie Pickard of Altamahaw. "It was all full of pimples and scars, but after using D. D. D. Prescription I can say that now there is no sign of that Eczema, and that was three years ago."

D. D. D. has become so famous as a cure and instant relief in eczema and all other serious skin diseases, that its value is sometimes overlooked in clearing up rash, pimples, black-heads and all other minor forms of skin impurities.

The fact is, that while D. D. D. is so penetrating that it strikes to the very root of eczema or any other serious trouble, the soothing Oil of Wintergreen, Thymol and other ingredients are so carefully compounded there is no wash for the skin made that can compare with this great household remedy for every kind of skin trouble.

D. D. D. is pleasant to use, perfectly harmless to the most delicate skin and absolutely reliable. Write the D. D. D. Laboratories, Dept. F. M., 49 Colborne St., Toronto, for a free trial bottle, and prove its wonderful effectiveness.

For sale by all druggists.

Hoarseness in a child subject to croup is a sure indication of the approach of the disease. If Chamberlain's Cough Remedy is given at once or even after the croupy cough has appeared, it will prevent the attack. Contains no poison. Sold by all dealers.

bull section and Robinson's Chromo's Merry Prince won the blue.

Josselyn & Young had the best senior bull calf and H. S. Pipes & Son captured the rest of the money in this class with two nice ones.

Pipes also won the red on junior bull calves and Robinson came in for second money.

Josselyn & Young got a first and a third prize in a class of eight good aged Jersey cows with Gladys of Rose Bank and Pedro's Judy, while R. Robinson sandwiched in between with Belle XVIII. of Hood Farm, a daughter of Hood Farm Waxey, second in the dairy test at St. Louis, by Hood Farm Torona.

Robinson's Figgis of Meadowview, headed the three-year-old cow class, of five, with Josselyn & Young's Flying Fox's Adora and Molly of Rose Bank close competitors, in second and third places.

Babbit, a home bred cow, by Brampton Financier, shown by H. S. Pipes & Son, carried off the red ribbon in the two-year-old heifer class as well as diploma for best female, any age. James E. Baker & Son, were second with Maud II, and Josselyn & Young's Pogus' Pet came in for the white ribbon.

In the younger sections H. S. Pipes & Son captured three firsts, two seconds and a third prize. Josselyn & Young captured a first, a second and a third place prize and Robinson won all the rest.

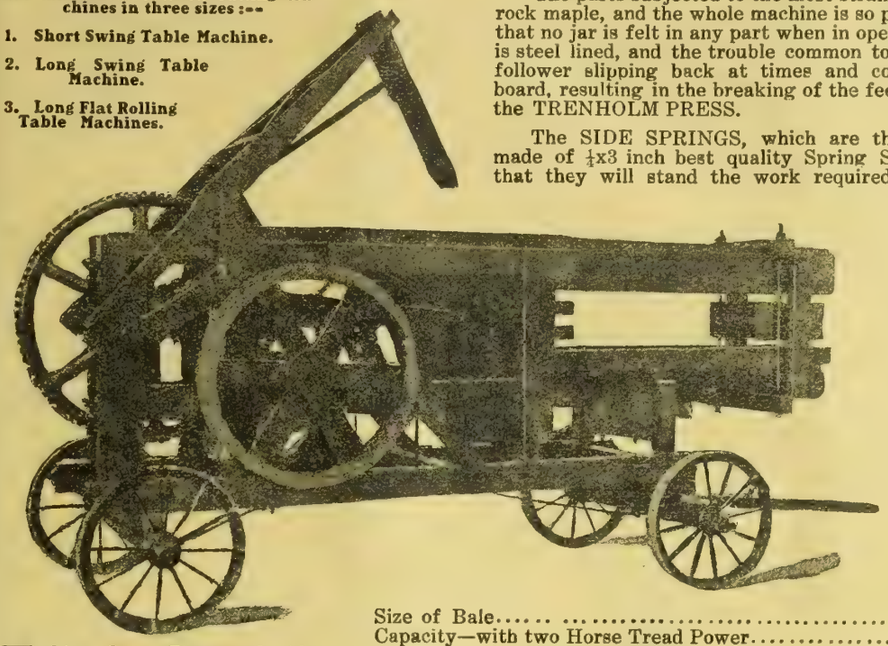
Pipes' aged bull, Fereor, was the champion male. Robinson's Fontaine of Meadow View was first with three of his get. Pipes had the first aged herd and the second and third young herds Robinson had the third prize aged herd and Josselyn & Young captured second prize on aged herd and first prize on young herd.

(Concluded next issue.)

The Improved Trenholm Gear Hay Press

We manufacture Wood Cutting Machines in three sizes :--

1. **Short Swing Table Machine.**
2. **Long Swing Table Machine.**
3. **Long Flat Rolling Table Machines.**



The parts subjected to the most strain are built of seasoned rock maple, and the whole machine is so powerfully constructed that no jar is felt in any part when in operation. The bale box is steel lined, and the trouble common to most presses, of the follower slipping back at times and coming under the feed board, resulting in the breaking of the feed arm is unknown in the TRENHOLM PRESS.

The SIDE SPRINGS, which are thoroughly tested, are made of ¼x3 inch best quality Spring Steel. We guarantee that they will stand the work required of them.

The FOLDER is properly located to do perfect work with ease and requires but a very slight spring pressure to operate. Every bale will be uniform in weight and neatly folded.

This machine will do more work with less power than any other on the market. The truth of this assertion has been proven in all parts of Eastern Canada.

Write for Description Catalogue and Prices.

HORSEMEN ATTENTION!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. They cure Cough, Cold, Distemper, Colic, Glanders, Spavin, Pink eye and all diseases of the Horse.

TRURO, N. S.

Dear Sirs,—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse liniment. The cough was of twelve months standing. In my large expeience with horses, I consider this liniment to be the best made for all diseases of the horse, and I recommend it to my friends.

E. J. ANDERSON.

BEAR RIVER, N. S.

DEAR SIRS,—

We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it.

Yours truly,

CLARKE BROS.

ORANGE MAIZE

WANTS HER LETTER PUBLISHED

For Benefit of Women who Suffer from Female Ills

Minneapolis, Minn.—"I was a great sufferer from female troubles which caused a weakness and broken down condition of the system. I read so much of what Lydia E. Pinkham's Vegetable Compound had done for other suffering women I felt sure it would help me, and I must say it did help me wonderfully. My pains all left me, I grew stronger, and within three months I was a perfectly well woman.

"I want this letter made public to show the benefit women may derive from Lydia E. Pinkham's Vegetable Compound."—Mrs. JOHN G. MOLDAN, 2115 Second St., North, Minneapolis, Minn.

Thousands of unsolicited and genuine testimonials like the above prove the efficiency of Lydia E. Pinkham's Vegetable Compound, which is made exclusively from roots and herbs.

Women who suffer from those distressing ills peculiar to their sex should not lose sight of these facts or doubt the ability of Lydia E. Pinkham's Vegetable Compound to restore their health.

If you want special advice write to Mrs. Pinkham, at Lynn, Mass. She will treat your letter as strictly confidential. For 20 years she has been helping sick women in this way, free of charge. Don't hesitate—write at once.

Stanstead Junction, P. Q., 12th Aug., 1893.

MESSRS C C. RICHARDS & CO.

Gentlemen,—I fell from the bridge leading from a platform to a loaded car while assisting my men in unloading a load of grain, The bridge went down as well as the load on my back and I struck on the ends of the sleepers causing a serious injury to my leg. Only for its being fleshy would have broken it. In an hour could not walk a step. Commenced using MINARD'S LINIMENT and the third day went to Montreal on business and got about well by the use of a cane In ten days was nearly well. I can sincerely recommend it as the best Liniment that I know of in use.

Yours truly,

C. H. GORDON.

First Annual

The old standby for all who have stock liable to stray, or to dispute as to identification or ownership; for herd or flock records, or for general convenience. Send for free circular and semple. It may save you much trouble. Write to-day.

F. G. JAMES, BOWMANVILLE, ONTARIO.

SEALED TNEDERS addressed to the undersigned, and endorsed "Tender for Warehouses at St John Harbour, N. B.," will be received at this office until 4.00 p. m., on Monday, Octobar 24, 1910, for the construction of Warehouse No. 7 and the extension of warehouse No. 6

Plans, specification and form of contract can be seen and forms of tender obtained at this Department and at the offices of J. K. Scammell, Esq., District Engineer, St. John, N. B. and Geoffrey Stead, Esq., District Engineer, Chatham, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupation and place of residence. In the case of firms, the actual signature, and nature of the occupation, and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works for the sum of three thousand ($3,000.00), dollars, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,

R. C. DESROCHERS,

Department of Public Works,

Ottawa, September 23, 1910.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

Special Notice!

Have sold out my stock of Poultry Supplies to the Maritime Poultry Supply Co., Moncton, N. B., who carry a full line of feeds and supplies of all kinds and will send catalogue to any address on receipt of post card.

J. FRANK ROACH,
Sussex, N. B.

Every Farmer's Wife in Canada Ought to Read this Advertisement

IF you, Madam, are a farmer's wife, you should use your influence to get your husband to roof the house and barn with Oshawa Galvanized Steel Shingles. For these practical reasons:—

Safe Against Lightning

Every thunderstorm that passes over your place endangers his life and your own, and threatens damage or destruction to the property. But there would be no such danger if the farm buildings were roofed with Oshawa shingles. They protect any building against lightning—far better than any lightning-rod system possibly can.

Safe Against Fire

And, at certain times in the year, the house you live in and the barn nearby is in danger from fire—flying sparks from the threshing machine; sparks from the kitchen chimney; sparks from passing locomotives; sparks from forest fires, perhaps. Farmer's roofs catch fire in many ways—and you are different from most farmer's wives if you do not dread this ever-present danger. You need not dread it at all when the buildings are covered with a seamless steel fireproof Oshawa shingled roof.

Improves Cistern Supply

Probably you depend a good deal on cistern water. An Oshawa-shingled roof keeps your cistern fuller, and the water is cleaner, tasteless, without odor. It never can be from a wood-shingled roof. It always is from an Oshawa-shingled roof.

Costs Very Little

When you speak to your husband about this, ask him to send for the instructive and handsomely-illustrated free book called Roofing Right. He will see, when he reads that, that the actual cost of an Oshawa-shingled roof is less than five cents per year for a hundred square feet of roof surface. He will see that this roofing is **guaranteed to satisfy in every sense for twenty-five years, or he gets a new roof** for nothing. He will see that it will pay him well to cover his house and barn with a roof that is **guaranteed wet-proof, wind-proof, fireproof and lightning-proof** for a **quarter century,** and that will be a good roof in every sense for fully 100 years.

Use Your Influence

Interest yourself in this vital matter. It directly concerns you. Get your husband to inquire into it. Get him to send for the free book—now—to-day. Or send for it in your own name. Do that, anyway. You will be interested in what the book tells you; and it is important that you, as well as himself, should know all about roofing, and about Roofing Right in particular. Send now for the book, please.

OSHAWA STEEL SHINGLES are made of 28 gauge steel, specially toughened and heavily galvanized to make them rust-proof. Thus they weigh about SEVENTY-EIGHT pounds to the square. With the box about 88 pounds to the square. When considering metal shingles always learn THE WEIGHT OF METAL per square offered and be sure that the weight is of the METAL ONLY.

Make the weight test yourself. First be sure the scales are accurate. Then unbox a square of Oshawa Shingles and weigh them. Note that the weight averages 78 pounds WITHOUT THE BOX.

Don't go by the box weight. Some boxes weigh fourteen pounds or more.

G. A. Pedlar

DON'T stop when you have Oshawa-shingled your roofs. That is only the first step towards making a house modern, or a barn what a barn should be. Go on and plate your house inside and out with steel. Cover the surface of your barn with steel. In a word, "Pedlarize" every building on your farm. This way:

Make Your House Fireproof

Finish the interior of every room in your house with Pedlar Art Steel Ceilings and Side-Walls. These are made in more than two thousand beautiful designs, the patterns stamped accurately and deeply into the heavy and imperishable metal. They cost less than plaster in the first place; and they will be like new when a plaster ceiling or wall is cracked to the danger point—which doesn't take long as a rule. They are easily put in place. They can easily be painted and decorated.

Make Your House Sanitary

Then, if you surface the exterior of the house with Pedlar Steel Siding—it is made to simulate brick, rough stone, cut stone—these Ceilings and Side-Walls and an Oshawa-shingled roof gives you a residence that is more nearly fireproof than the "skyscrapers" of the great cities. Also, such a house will be much warmer in winter than if it were built of solid brick—and so it will save its cost in fuel-savings. It will be cooler in summer. It will be sanitary inside—you can wash the ceilings and walls clean with soap-and-water. It will be a handsome, substantial, and enduring proof of your judgment in choosing the modern building material—steel—Pedlar-made Steel.

Make Your Barns Safe

With Pedlar Steel Siding you can finish the outside of your barn most economically, and your cattle will thrive better in bitter weather than if they were housed in a solid concrete barn. This heavy-gauge seamless steel finish, keeps out the wind and keeps in the animal heat. It saves in lessened feed-bills enough to pay its cost over and over. It costs but little; it is simple to put on; and it will outlast the building's very timbers. Most important of all, it—with Oshawa Steel Shingles for the roof—makes barns practically proof against fire, entirely free from every kind of dampness, and proof against lightning.

Learn About Pedlarizing

At the same time you send for your free copy of Roofing Right Booklet No. 17, ask us for particulars about these other Pedlar specialties. We will send you samples of any of them; prices; illustrations; and samples of the Oshawa Steel Shingle as well—all just for the asking.

Published twice-a-month in the Interests of the Farmers of the Maritime Provinces of Canada

Vol. 16. SUSSEX, N. B., OCTOBER 25, 1910 No. 2

Here is the PREMIER Offer

—Try it free. See it get you more cream. See the Extra Cream it Gets---pay you its Cost.

Then, when You have Tried it out—PAY.

The Premier Cream Separator saves all the cream in your milk, and gets you more money by separating cream that would usually go into skim milk.

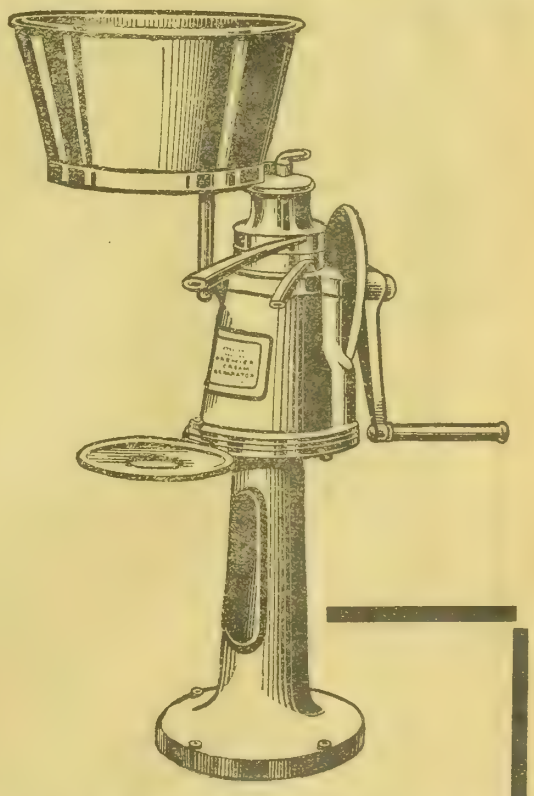
The extra money for this extra cream pays for the Premier.

This we will prove to you by having a Premier Cream Separator put on your farm free, by our nearest agent. To take our offer, merely write a post-card, sending your name.

The Premier is the easiest machine to turn, thus enabling you to separate all the cream by keeping the bowl at full speed, and your girl or boy can operate it as surely as you can.

By being the quickest separator to clean, the Premier Cream Separator saves trouble and time. It is always ready.

See your increased cream deliveries under this free offer to test the Premier. Then you may buy it on a basis by which the extra money it earns entirely pays for the Premier,without you feeling it.



THE PREMIER CREAM SEPARATOR

Self-centering and self-balancing bowl—ball-bearing gear boxes—very strong rigid frame. These make it light running.

Separate bowl and spindle, rustless aluminum separating plates. These make it easy to clean.

FREE BOOK—WRITE FOR IT.

You can get from us a plain, illustrated book that describes all the details of the Premier Cream Separator. Write for this book. It may mean a saving of at least $100 a year to you for 20 or 25 years. Write to-day.

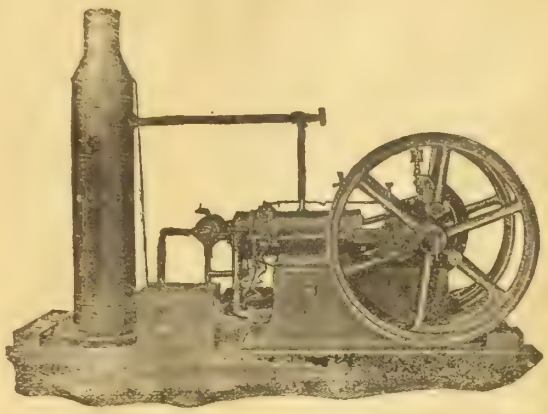
Farmers of Quality



Stationary and Mounted, in 1 1-2 to 30 Horse Power

Want Quality!

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the **"Ideal"** is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of sealing directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinder head, so that when the valves become worn, the valve cage and valve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn, you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer.

"Ideal" Gas and Gasoline Engines are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price.

Unreserved Dispersion Sale of Ayrshire Cattle

To be Held at

Hampton Stock Farm, Hampton, N. B.

22 Miles East of St. John, on Intercolonial Railway, on

THURSDAY, NOVEMBER 10th, 1910

Commencing at 1.30 P. M. sharp, on arrival of C. P. R, train from the West.

The stables are conveniently situated near the Hampton station, within 5 minutes' walk. The train from the East is due at 1 P. M. and the through train from the west is due at 1.25. Our sale will commence on arrival of this train. Connections can be made for returning home, both East, West, North and South the same night.

Being unable to make satisfactory arrangements for re-leasing the farm we recently occupied, it has been decided to offer our entire stock of Pure Bred Ayrshires without reserve to the highest bidder. Bargains may be expected, as all must be sold at some price.

Terms for Sale.—Under $25.00 cash, subject to a discount of 5%. Over $25.00 may be settled by approved notes at 6 months without interest, after that, subject to 6% interest.

Certificates of registration with transfer of ownership and for females in calf certificates of service will be given purchaser.

COWS

1.—Nellie Osborne 3rd of St. Annes, 10010. Ear Label No. 1. Brown and White. Calved September, 1899. Bred May 16th, 1910, to Netherhall Nobleman. Last Milk Record 7,000 pounds in 14 months. Average test 4.4.

2.—Bessie 7th of Auchenbrain, 16186. Ear Label No. 5. Mostly White with Brown spots. Calved Feb., 1903. Sire—Sir Charles of Spruce Grove. Dam—Bessie 4th of Auchenbrain. This cow is an extra heavy producer. Bred July 29th, 1910, to Netherhall Nobleman. Last Milk Record 7,224 pounds in 11½ months. Average test 4.2.

3.—Gurta of Plantagenet, 12108. Ear Label No. 3. Calved August, 1899. Sire - Isaleigh Earl. Dam—Bertha Plantagenet. Bred May 8th, 1910, to Netherhall Nobleman. Last Milk Record 5,192 pounds and doing better this season.

4.—White Rose of Kelso, 17220. Ear Label No. 6 White and Brown. Calved Sept., 1902. Sire—Glenora Dairy Prince. Dam—Maud of Kelso. This cow was sweepstake cow at St. John in 1906. Her last calf was dropped July 15th, 1910, and she will likely be bred again by time of sale.

5.—Jessie of Spruce Grove, 22235. Ear Label No. 8. White with few Brown spots. Calved Sept., 1904. Sire Lord Dudley. Dam—Bonny Lass of Brookhill. Dropped her last calf July 19th, 1910, and she will likely be bred by time of sale. Last milk record 4,329 pounds in 9 months.

6.—Lily of Spruce Grove, 22123. Ear Label No. 11. White with little Brown on side of head. Calved Dec., 1904. Sire—Lord Dudley. Dam—Daisy of Elmshade. Dropped last calf Sept. 5th, 1910. Last Milk Record 5,497 in 10 months.

7.—Lady Ethel of Brookhill, 13875. Ear Label No. 7. Red and White. Calved August, 1901. Sire—Isaleigh Earl. Dam—Irene of Brookhill. Due to calve Oct. 7th, 1910. Will be fresh at date of sale. This is a very trim cow and has dropped 3 heifer calves in succession. Last Milk Record 5,158 pouuds in 10 months.

8.—Gurta 2nd of Allandale, 25405. Ear Label No. 12. Red and White. Calved August, 1906. Sire—Dainty Lad of Glenview. Dam—Gurta of Oshawa. Bred Sept. 3rd, 1910, to Stadaconna Conqueror. Last Milk Record 5,343 pounds in 11 months with her first calf. The Dam of this cow was in our herd till last year, and is 19 years old, without a sign of breaking down. The Bull this cow is now bred to is out of a record of performance cow, and his Grand Sire was a champion at St. Louis.

9.—White Rose of Hampton, 24550. Ear Label No. 17. White, Red on tips of ears. Sire—Lord Dudley. Dam—White Rose of Kelso. Calved August, 1907. Is in milk with first calf now, dropped July 29th, 1910.

10.—Gurta 2nd of Hampton, 24947. Ear Label No. 19. White, with Red cheeks and spots on body. Calved August, 1907. Sire—Lord Dudley. Dam—Gurta of Plantagenet.

11.—Bonny Lass of Hampton, 24494, Ear Label No. 18. White with Red spots on neck and head. Calved August, 1907. Sire—Lord Dudley. Dam—Bonny Lass of Brookhill. Is in milk with first calf now, dropped July 17th, 1910. Bred Oct. 3rd, 1910, to Stadaconna Conqueror.

A Group of Hampton Ayrshires.

12.—Ethel of Hampton, 24946. Ear Label No. 20. Red and White. Calved Sept., 1907. Sire—Netherhall Nobleman. Dam—Lady Ethel of Brookhill. Due to calve with first calf before day of sale.

13.—Lily of Hampton, 24565. Ear Label No. 15. White with Red spots on both sides of neck. Calved Aug., 1907. Sire—Netherhall Nobleman. Dam—Lily of Spruce Grove. Bred Feb. 18th, 1910. Due Nov. 25th, 1910.

14.—Ethel 2nd of Hampton, 27676. Ear Label No. 30. White with Red spots. Calved Oct., 1908. Sire—Netherhall Nobleman. Dam—Lady Ethel of Brookhill. Bred Aug. 25th, 1910, to Stadaconna Conqueror.

15.—Jessie of Hampton, 27677. Ear Label No. 27. White with Red spots. Calved Aug., 1908. Sire—Netherhall Nobleman. Dam—Jessie of Spruce Grove, not bred.

16.—White Daisy of Hampton. Ear Label No. 33. Dam—White Rose of Kelso. Sire—Netherhall Nobleman. All white except little fawn on tips of ears. Calved Aug. 26th, 1909.

17.—Ethel 3rd of Hampton. Ear Label No. 40. Dam—Lady Ethel of Brookhill. Sire—Netherhall Nobleman. Calved Sept. 30th, 1909.

HEIFER CALVES

18.—Primrose of Hampton. Ear Label No. 45. Mostly White. Dam—White Rose of Kelso. Sire—Netherhall Nobleman. Calved July 15th, 1910.

19.—Queen Annie of Hampton. Ear Label No. 46. Mostly White. Dam—Jessie of Spruce Grove. Sire—Netherhall Nobleman. Calved July 19th, 1910.

20.—Lady Jewel of Hampton. Ear Label No. 48. Dam—Bonny Lass of Hampton. Sire—Netherhall Nobleman. Calved August 17th, 1910. Mostly White.

21.—Lily May of Hampton. Most all White, few Fawn spots on side of cheek. Ear Label No. 49. Dam—Lily of Spruce Grove. Sire—Netherhall Nobleman. Calved Sept. 4th, 1910.

BULL CALVES

22.—Netherhall King.—Most all White with Fawn spots on side of cheeks. Ear Label No. 47. Dam—White Rose of Kelso. Sire—Netherhall Nobleman. Calved July 29th, 1910.

28.—Netherhall Prince. Most all White with Fawn spots on side of cheeks. Ear Label No. 44. Dam—Gurta of Hampton. Sire—Netherhall Nobleman. Calved Aug. 7th, 1910.

Also 1 pair of Farm Horses, about 1,100 pounds each.

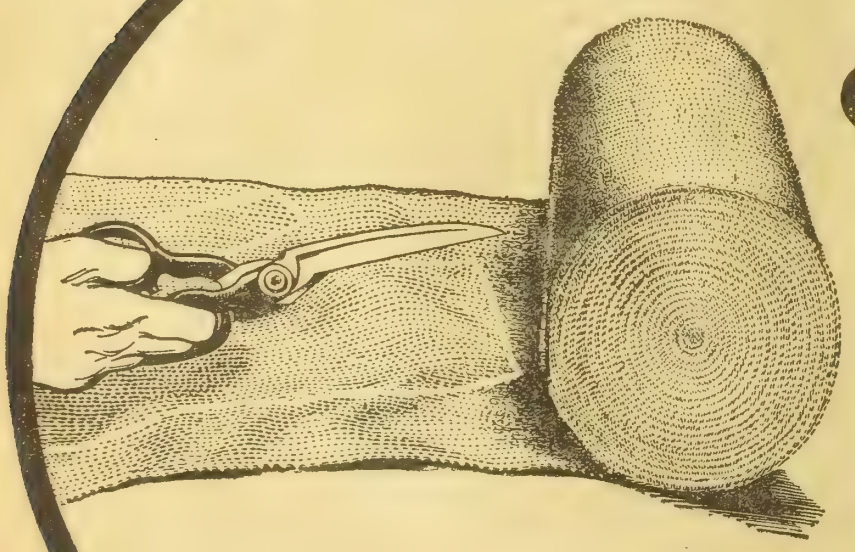
If a tailor fitted your Underwear your comfort would be ideal—but expensive. Yet this essential hand-cut shapeliness is yours in Stanfield's Unshrinkable Underwear—at ordinary cost. Because tailor's shears in the deft hands of experts cut every single garment to perfect proportions. Ask your dealer for your size and get a fine fit; snug yet not binding, readily yielding but never baggy. The lasting elasticity in Stanfield's Unshrinkable Underwear is produced by ingenious machines. But we haven't seen a machine yet that could equal our tailors' cutting skill.



Garments Cut and Tailored by Hand

STANFIELD'S
Unshrinkable
UNDERWEAR

Made both for women and for men in perfectly fitting sizes. Twenty-one different weights and qualities:—from warm, heavy ribbed garments particularly suitable for outdoor workers to the soft, finely knitted underwear so soothing to sensitive skins. Your local dealer sells Stanfield's Unshrinkable Underwear. Catalog on request

Report of International Commission on the Control of Bovine Tuberculosis.

At the Veterinary Medical Association.

IN annual me?ting assembled, at Chicago, Illinois, in the month of September, in the year nineteen hundred and nine, the following gentlemen were constituted an International Commission to study the methods of the control of Bovine Tuberculosis and to submit a report of its next annual meeting:— J. G. Moore, Hon. W. D. Hoard, Frederick Reynolds, Hon. W. C. Edwards, C. A. Hodgetts, M. D., J. R. Mohler, Louis F. Swift, J. W. Flavelle.

The Commission met in Buffalo, New York, on the fifteenth day of December, nineteen hundred and nine and elected as chairman, Dr. J. G. Rutherford, of Ottawa, Canada, and as Secretary, Dr. M. H. Reynolds, of St. Paul, Minnesota.

Owing to the death of Dr. Leonard Pearson, and the inability to act of Mr. Louis F. Swift, the President appointed in the stead of these gentlemen respectively, Dr. M. P. Ravenal, of Madison, Wisconsin, and Mr. T. W. Tomlinson, of Denver, Colorado. Later at the request of the Commission the President appointed Mr. J. J. Ferguson, of Chicago, Illinois, as representative of the United States Packing Industry, and Dr. J. N. Hurty, of Indianapolis, Indiana, as representative of the Medical Health officers of the United States.

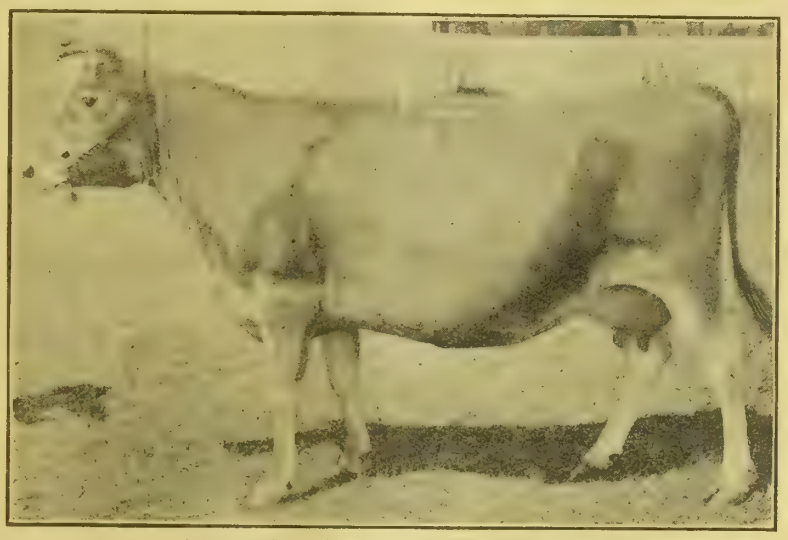
The Commission reports as follows:—

The Commission has held four meetings as follows:—Buffalo, N. Y., December 13th and 14th., 1909; Detroit, Mich., March 1st and 2nd, 1910; Ottawa, Canada, May 19th, 20th and 21st., 1910; Madison, Wis., June 27th and 28th, 1910, all of which were well attended, very few of the members having on any occasion been absent. The Commission begs to present as a result of its labors the following report which, although brief, will, on examination, be found to comprise the principal points essential to the promulgation of a comprehensive and practical policy, such as may reasonably be adopted by any governmental body interested in the control of bovine tuberculosis.

It is quite unnecessary in view of the extensive knowledge already possessed by all who are familiar with the efforts which have hitherto been made to secure control of bovine tuberculosis, to dwell at any length upon the importance of the subject or upon the conditions which led to the formation of the Commission.

In view of the personnel of the Commission as selected by the American Veterinary Medical Association, and of the fact that so much information on the subject has been made available through the work of similar bodies in other countries, and the researches of scientific and practical men in America and elsewhere, the Commission has not deemed it necessary to take any evidence either from expert witnesses or other.

The members fully understood that the purpose which their appointment was intended to serve was less the acquisition of new knowledge to the Association on the occasion Rutherford, Leonard Pearson, V A. Torrance, E. C. Schroeder, M. H.



Brampton Eminent Gidder

First in dry four-year-old cow class and senior and grand champion Jersey cow at Dominion Exhibition, St John, N. B., 1910. Owned by B. H. Bull & Sons, Brampton Ontario,

regarding bovine tuberculosis, than the careful study of the knowledge already available, and of the thought and opinions of those most entitled to speak with authority on the subject.

The conclusions reached in this report are, therefore, simply the outcome of an earnest and thoughtful consideration of the various modern aspects and phases of the problem, with the object of crystallizing public opinion and so clearing the way for legislative action.

They realized also that they could deal with fundamental principles only, and that the details of any policy which they might outline, must in each case be worked out by the duly authorized and responsible representatives of the community immediately concerned.

They, nevertheless, deemed it essential to study closely the history of the various efforts hitherto made by such countries throughout the world as have attempted to legislate on the subject.

This naturally led to the gradual elimination of all methods other than such as might reasonably be adopted by any community desiring, in the full light of present day knowledge, to undertake the control of bovine tuberculosis.

It was felt, in view of the prevalence of the disease, especially in some localities and among certain classes of cattle, the difficulty of providing a sufficient number of trained officials and the large economic question involved, to say nothing of the enormous expenditure, that it would be unwise for the present at least, to seriously discuss a policy of universal compulsory testing and slaughter.

Such a policy might perhaps be adopted with advantage by a small community, or one in which the disease existed to a very limited extent, but speaking generally, especially in view of past experiences in this line, it was thought better to omit it entirely from the recommendations of the Commission.

All other methods of dealing with bovine tuberculosis which have been recommended or tried in various communities, were thoroughly discussed, with the object of discarding weak points and adopting such features as might be deemeh worthy of a place in the official findings of the Commission.

Every phase of the subject was in this way fully and freely considered, it being thought best to cover the whole ground as completely as possible before coming to a definite decision on any one point.

In order to still further minimize the risk of omitting from the deliberations of the Commission any phase of the question, four committees were appointed at the first meeting to deal respectively with:—

(1) Education and legislation.
(2) Location of tuberculosis.
(3) Dissemination.
(4) Disposition of tuberculosis animals.

The appointment of these commitees proved to be of the greatest

possible value in concentrating the energies of the various members on those branches of the subject with which they were most familiar, and their reports presented at subsequent meetings enabled the Commission to reach satisfactory conclusions much more rapidly than would oth?rwise have been the case.

As a means of furnishing information as to the reasons for these conclusions and the manner in which they were reached, the Commission would recommend that the reports of the committees should be published as an appendix to this report.

The Commission recognizing after careful study that the tuberculin test is the fundamental factor in any policy having for its object the control of bovine tuberculosis, decided that a pronouncement to that effect should properly occupy a foremost place.

Based on the information contained in the reports of its Committees and on such other information as was brought out in the general discussions of the Commission, the following resolutions were adopted for presentation to the American Veterinary Medical Association.

RESOLUTION 1.—DISSEMINATION

As a general policy to be observed all contact between tuberculous and healthy cattle and between healthy cattle and stables, cars, etc., which may contain living tubercle bacilli should be prevented. To accomplish this the following specific recommendations are made:—

1. There should be no sale or exchange of animals affected with tuberculosis except for immediate slaughter or for breeding purposes under official supervision.

2. That the management of live stock shows should give preference to cattle known to be free from tuberculosis, either by providing special classes for such cattle or in some other practical way, and should also take every precaution to prevent contact between such animals and those not known to be free from disease.

3.—All live stock shippers should take every precaution to see that cars furnished are thoroughly cleansed and disinfected before used.

RESOLUTION 2. TUBERCULIN TEST.

1. That tuberculin, properly used, is an accurate and reliable diagnostic agent for the detection of active tuberculosis.

2. That tuberculin may not produce a reaction under the following conditions:—

(a) When the disease is in a period of incubation.

(b) When the progress of the disease is arrested.

(c) When the disease is extensively generalized.

The last condition is relatively rare and may usually be detected by physical examination. ...

3. On account of the period of incubation and the fact that arrested cases may sooner or later become active, all exposed animals should be retested at intervals of six months to one year.

4. That the tuberculin test should not be applied to any animal having a temperature higher than normal.

5. That any animal having given one distinct reaction to tuberculin should thereafter be regarded as tuberculous.

6. That the sub-cutaneous injection of tuberculin is the only method of using tuberculin for the detection of tuberculosis in cattle which can be recommended at the present time.

7. That tuberculin has no injurious effects on healthy cattle.

RESOLUTION 3.—EVIDENCE FROM TUBERCULIN TEST.

That a positive reaction to tuberculin in any properly conducted test, official or otherwise, in any animal in any herd, shall be considered evidence sufficient upon which to declare the herd to be infected.

RESOLUTION 4.—COMPULSORY NOTIFICATION.

That this Commission recommends the passage of legislation providing for the compulsory notification by owners and by veterinarians of the existence of tuberculosis in a herd, whether such existence be made known by detection of clinical cases or by the tuberculin test.

RESOLUTION 5.—LOCATION THROUGH SLAUGHTER.

This Commission recognizes that the discovery of tuberculosis in animals slaughtered for food purposes furnishes one of the best possible means of locating the disease on the farm, and therefore recommends the adoption of some system of marking, for purpose of identification, all cattle three years old and over, shipped for slaughter.

As tuberculosis of hogs is almost invariably due to bovine infection, this recommendation should also be made to apply to hogs of any age shipped for slaughter.

It is further recommended that the discovery of tuberculosis in animals coming under Government inspection should be used whenever identification is possible, as a means of locating infected herds and premises. All such cases should be reported to the proper authorities for control action.

RESOLUTION 6.—DISPOSITION OF TUBERCULOUS ANIMALS.

The Commission Plan.—1. As a general policy in the eradication of tuberculosis the separation of healthy and diseased animals, and the construction of a healthy herd are recommended.

In order to accomplish this, the following recommendations are made:—

(1) If the herd is found to be extensively infected, as shown by the tuberculin test or clinical examination, even the apparently healthy animals in it should be regarded with suspicion, until they have been separated from the reacting animals for at least three months.

If after the expiration of this time they do not react to the tuberculin test, they may be considered healthy and dealt with accordingly.

It is recommended that a herd extensively infected should not be treated by the method of general separation, but that the construction of a new herd from the offspring only is advisable.

(2) If the herd is found, by either or both of the above methods, to contain a relatively small proportion of diseased animals separation of the diseased animals from the healthy animals, and the construction of a sound herd from the healthy animals, and the offspring of both, is advocated.

As a working basis in carrying out these principles, we advise,

(a) That herds containing 50 p. c. or more of diseased animals be treated as coming under Section 1.

(b) That herds containing under 15 p. c. of diseased animals be treated as coming under Section 2.

(c) That herds falling between these figures be graded according to the option of the owner.

(d) That it shall be the prerogative of the owner to reject either plan and have his herd dealt with by removal and slaughter of diseased animals, with or without compensation, according to the public policy in operation. ...

2. That when by any means the officials properly charged with the control of tuberculosis become aware of its existence in a herd to which a policy of slaughter and compensation cannot reasonably be applied, such herd must be dealt with by the owner, under Government supervision, on the principle of the separation of all sound animals from those affected. Such separation must be effected by treating the whole herd as diseased, and rearing the calves separately, either on pasteurized milk or the milk of healthy cows, or when the number of those affected is so small as to warrant such a course, by the application to the whole herd, from time to time, under official supervision, of the tuberculin test, and the entire segregation of all animals found to react.

In the event of any owner refusing or neglecting to adopt either of the above methods, his entire herd ta be closely quarintined, and sales therefrom to be entirely prohibited.

3. That a policy of compensation be recommended as useful and usually necessary as a temporary measure.

4. That, when slaughter is necessary, in order to avoid economic loss, every effort should be made to utilize as far as possible the meat of such animals as may be found fit for food on being slaughtered under competent inspection.

5. The details of the Commission Plan will be found fully set forth in the appendix to this report.

RESOLUTION 7.—PREVENTION.

1. That, with the object of preventing the spread of infection, persons buying cattle for breeding purposes or milk production should, except when such purchases are made from disease free herds which have been tested by a properly qualified person, purchase only subject to the tuberculin test. In order to assist in the proper carrying out of this suggestion, the Commission recommends that official authorities should adapt such regulations as will prevent the entry to their respective territories of cattle for breeding purposes or milk production unless accompanied by satisfactory tuberculin test charts.

2. That all milk and milk by-products used as food should be properly pasteurized unless derived from cows known to be free from tuberculosis.

RESOLUTION 8.—CONTROL OF TUBERCULIN TEST.

That this Commission recommends the passage of legislation which will prevent the sale, distribution or use of tuberculin by any persons other than those acting with the full knowledge, or under the direction, of official authorities.

RESOLUTION 9.—EDUCATION.

As a clear knowledge of the cause and character of tuberculosis among animals, the mode of dissemination its significance as an economic and as a public health problem, underlie an intelligent adherence to the principles that must be observed in all efforts for eradication, as well as tne establishment of proper co-operation in the great work between physicians, veterinarians, live stock owners, legislators, and the public generally, it is recommended that a widespread campaign of education be undertaken. To accomplish this end it is recommended that first of all a simple pamphlet on bovine tuberculosis be written, in which the language used shall be of such character that every person of average intelligence shall be able to read it without being mystified by technical terms or phrases. This pamphlet should be published with the endorsement of the American Veterinary Medical Association and the special endorsement and consequent authority of the International Commission on Bovine Tuberculosis Control.

RESOLUTION 10.—PUBLICITY.

In concluding its work the Commission desires to especially appeal to the press, metropolitan, agricultural and local to join in the work of extending as much as possible among the people the conclusions here arrived at. The vital importance of the life of farm animals to the welfare of all classes of society needs no argument in its support. The aim and sole purpose which has actuated this Commission has been to arrive at the soundest conclusions possible in the light of the best knowledge obtainable.

RESOLUTION 11.MLEGISLATION.

It is recommended that legislation regarding the control and eradication of tuberculosis among domestic animals be made uniform; that the laws of the United States and Canada and other American countries for the admissian into America of animals from without be made stringent and as much alike as possible; and that the laws governing the inter-state and inter-provincial movement of cattle and that between different American countries be harmonized.

The laws governing inter-state and inter-provincial movement of cattle should be of such character that every state and every province will be free in its eradication work from unnecessary difficulties due to the existence of the disease in other states and provinces.

Legislation is especially required to prevent the various frauds which interfere with the satisfactory use of tuberculin as a diagnostic agent for tuberculosis, as well as for official supervision over all tuberculin sold to be used by veterinarians and others.

RESOLUTION 12.—SANITATION.

In the eradication of tuberculosis it should be kept in mind that, in addition to protecting animals against exposure to tubercle bacilli, it is desirable to make them as resistant to infection as possible. This can be done by stabling them in clean disinfected and properly ventilated and lighted barns giving nutritious food, a sufficient amount them abundant clean water and of daily exercise in the open air, and attending generally to those conditions which are well known to contribute to the health of animals.

The daily removal of manure from stables, and water tight floors and good drainage in stables are urgently recommended.

Young stock particularly should be raised as hardy as possible and should be accustomed to liberal exercise and living in the open.

RESOLUTION 13.—IMMUNIZATION

That as none of the various methods for the immunization pf animals against tuberculosis have passed sufficiently beyond the experimental stage the Commission is unable to endorse any of these for practical use at the present time.

RESOLUTIOE 14.—ANIMAL TUBERCULOSIS AND PUBLIC HEALTH

While the members recognize that the subject with which the Commission is primarily intended to deal is the control and eradication of tuberculosis among animals as an economic problem they cannot feel satisfied without declaring their recagnition of the fact that tuberculosis among animals is also an important public health problem. Considered as such, the eradication of tuberculosis among animals should have the approval and support of all those persons who are interested in curtailing human suffering and prolonging human life.

RESOLUTION 15.—GENERAL STATEMENT.

The members of the Commission wish it to be clearly understood that they recognize the limitations of a report necessarily based on actual and not on theoretical conditions. They fully realize that in the event of the policy of which their recommendations form the framework, being anywhere adopted even in its

entirety, much greater benefit will be derived, at least for some time, from its educative than from its executive features.

The control to say nothing of the eradication of bovine tuberculosis, is impossible of achievement, without the hearty co-operation of the men who are actually engaged in the cattle industry. In order to secure this co-operation, it will doubtless be necessary, in most communities, to carry on an active and prolonged educational campaign.

It is apparent that in the dissemination of practical and reliable information regarding the disease, it will be possible to employ a very large variety of methods. Many of these methods, such as bulletins, lectures and actual demonstrations of disease, having already been found valuable, will doubtless continue to be largely used.

It must not be forgotten however, that in this, as in any other ?ducative process, a measure of disciplinary control is essential to success.

Needless to say such control can be secured only by the passage of legislation which, while clear and comprehensive must, at the same time, be sufficiently conservative to avoid exciting alarm or arousing antagonism on the part of owners especially of valuable herds.

The best law ever framed can be made an utter failure by stupid or injudicious administration while, on the other hand, the most drastic legislation can be rendered acceptable if enforced with reasonable tact and diplomacy.

Provided therefore, that these qualities, combined with integrity, thoroughness and determination, are available for administrative purposes, the members of the Commission are convinced that the enforcement of a law based on their recommendations, will prove to be by far the most powerful and effective educational agency which could possibly be employed.

In concluding its Report the Commission would suggest that the Association should make such provision as may be necessary to carry on the work either by continuing the Commission as at present constituted or with such changes in the personnel as may be considered desirable.

Signed.

West Highland and Short Horn Cattle.

Editor Maritime Farmer.

Will you kindly give a description of the Shorthorn and West Highland Cattle, in the columns of your paper, as to their different qualities.

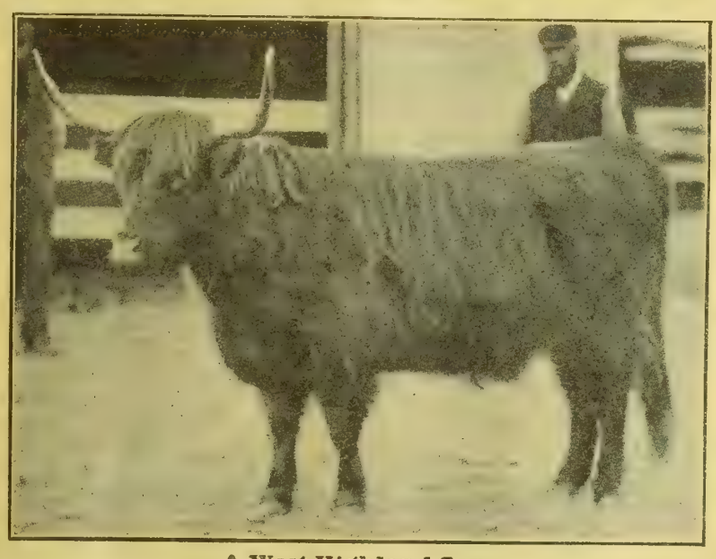
We have recently iported a number of the above mentioned breeds and as there is some difference in the looks of them most people cannot understand why we should have the Highland cattle at all. We have some very rugged and scant pasturage in the northern part of the Island to which we have sent the Highlanders.

We will thank you for a description as to their hardiness etc.- so that the people can be convinced of their fitness for places such as those above meotioned.

Yours truly,
FRANK H. SIMMS,
Secretary Newfoundland Agricultural Board.

ANS.—THE DURHAM OR SHORT HORN—This important breed of cattle is said to have had its origin in the blending made over 200 years ago of two sorts of large cattle formerly found in the valley of the Tees in England. But perhaps the real foundation of the breed ought to be set down as having been made in the last quarter of the eighteenth century at Ketton and Brampton, in the county of Durham, by the Messrs Charles and Robert Colling. These enterprising brothers, although quite young, had the sagacity to adopt the original methods of breeding which Robert Bakewell, the celebrated improver of Longhorn cattle and Leicester sheep had, for some time previous, been so successful in making use of; and their skill in applying his methods soon raised the Shorthorns to a pitch of excellence among British breeds of cattle which the breed has ever since retained. There are several famous strains of Shorthorns, each known by the name of its founder, namely, the 'Booth," the "Bates", and the "Cruikshank."

A Shorthorn Cow



A West Highland Cow

The "Booths" derive their name from Thomas Boooth, who lived at Killerby and Warlaby, in Durham, about the end of the eighteenth century, and from his two sons, John Booth, of Killerby and Richard Booth, of Studley, in Yorkshire. The "Bates" family derive their name from Thomas Bates, of Kirklevington, in Yorkshire, whose improvements were begun about the beginning of the nineteenth century. The "Cruichshanks" derive their name from Amos and Anthony Cruickshanks, of Sittyton, Aberdeenshire, who began their work about 1838. Shorthorns make a good use of the food given them, "fattening as they grow," as the phrase is, and are not excelled for their early-maturing qualities. Probably, of all cattle, they attain to the heaviest weights. Moreover, when bred for the purpose, they prove very good milkers. They are also remarkable for the ease with which they adopt themselves to changes of climate or food. The standard color for the Shorthorn is, red, white or roan.

THE WEST HIGHLAND CATTLE, or Kyloes, are found in all the Highlands of Scotland, but in greatest perfection in the larger Western Islands. Bred from time immemorial in the cold, humid climate and on the coarse pastures of the bleak hills and glens of their native country, they have developed great hardiness of constitution and the ability to thrive and fatten on meagre fare, such as some of the other breeds woulh starve upon. In symmetry of form, nobleness of bearing, and picturesque beauty, they are unequalled by any other breed, and they are so highly prized for their appearance that they are aften kept instead of deer in the parks of noblemen. In color they are generall black, but sometimes they are of a tawny yellow color, or light dun, and these are the colors preferred. Their hair is thin and shaggy, and their horns are wide and well set apart. Their meat is of excellent quality. Owing to their capability of enduring all sorts of weather with little or no artificial protection, and also to their staying power as travellers, and their ability to turn coarse and meagre fodder into the best quality of meat, they are becoming favorites with the ranchmen of our Northwest and Western Statesf They are not, however, good milkers, and mature rather slowly. They are also somewhat small in size.

Coughing Cow.

D. S. F., Queens Co., N. B. — I have a cow that coughs and has a very bad discharge of blood and matter from her nose which hinders her breathing. She eats well and seems in good spirits. Is her milk fit for use and what can I do for her ?

Ans.—Coughing is one of the symptoms of tuberculosis as is also a discharge from the nose. Occasionally, neither one of these symptoms present in tuberculous animals. It is advisable, in all cases, such as you relate, to have a tuberculin test made by a competent veterinarian as owing to the infectiousness of tuberculosis to man, cattle, hogs and poultry, it is advisable to make sure whether the animal is tubercular or not, and, if so, destroy or isolate at once, to prevent spread of the disease.

There are several other diseases which cause coughing, such as Laryngitis and Catarrh, both of which may cause a discharge from the nose and if a blood-vessel in the air passage ruptures, as is sometimes caused by coughing, the nasal discharge will be bloody. If the discharge, is due to either catarrh or Laryngitis, a good treatment would be to house the animal in a well ventilated, light and clean stable. Feed easily digested, nutritious food, such as wheat bran mashes or oat chop in reasonable quantities along with well cured hay and pulped roots. Give cold water as desired. Steam the head twice a day by holding a pail of boiling water under the nose. Dissolve in the water one teaspoonful of Tincture of Camphor for first steaming and the same quantity of Carbolic Acid for the next steaming. Continue alternately the medicine but do not cover the head to force the animal to inhale only medicated air. As the water cools, stir to increase the steam. Rub the throat, night and morning, from base of ears down between lower jaws with a liniment made by mixing four ounces each of Oil of Turpentine, Raw Linseed Oil and Liquor Ammonia. When the parts are well blistered stop applying the liniment and give in food, three times a day, two drams of Chlorate of Potash. As she is feeding well and in good spirits tonics are not necessary. If she reacts to the tuberculin test her milk is not fit for use unless it is well boiled.

J. STANDISH, V. S.

Plowing Under Second Growth Clover.

A Charlotte County, N. B., subscriber enquires if it would be more profitable for him to plow under a second growth crop of clover or harpest it for feeding purposes.

Ans.—In my opinion the very best use to make of this field of clover in questian would be to pasture it down this fall, if it is proposed to plow the field. If it is intended to leave in hay next summer, then, it would be advisable to cut the second growth and cure for hay or make into ensilage, as most convenient.

If the soil whereon this clover is growing is very light, or rather poor in humus, it would certainly be advantageous to turn the crop under with a snallow furrow, and so increase the amount of humus in the surface soil. J. H. GRISDALE.

Editor's Note:—What is the experience of our readers in this matter.

The pleasant purgative effect experienced by all who use Chamberlain's Stomach and Liver Tablets, and the healthy condition of the body and mind which they create, makes one feel joyful. Sold by all dealers.

THE MARITMIE FARMER

And Co-operative Dairyman.

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association The Nova Scotia and P. E. Island Fruit Growers' Associations The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers Association, and The New Brunswick Poultry Aassociation.

Subscription Price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for dis. continuance is given.

The date after your name on the little green label on front Page is, in every case, the time which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser be said :—**"I saw" your adv. in the MARITIME FARMER.**

LAST CALL TO NOVA SCOTIA AGRICULTURAL COLLEGE.

Will it pay me, farm boy, to attend some school of agricultnre when I intend to return to the farm?

This question is now being asked by many a young man of our Maritime Provinces. Let us look at it fairly. Remember that all knowledge that the human family possesses, all that is known, whether it be of agriculture or astronomy, is but the recorded experience and observation of a lot of individuals. To one man is given but a very small part of this vast amount of experience. The more men of brains one can come in contact with, the more will that one be quickened in thought, but to meet personally a half-dozen men in every province in Canada and extract from each one the essence of his life-work and thought would be out of the question. That is not necessary. In these days of cheap, but good books and papers, one man's success or failure may prove a blessing to thousands, and the best place to meet these and learn how to use and how to appreciate or depreciate them is in a live school of agriculture. Moreover, no small part of the value of any schooling comes from the contact with other students. One who learns farming by farming only learns the business from the inside only, and does not view it from above as one of many professions. He cannot judge his own methods in their true relation to his work until he has seen and learned how others, equally practical, perform the same thing. It is often said that the "book farmer" is a visionary, impractical fellow and of little value to himself or anybody else. If he has the "know" and not the "know how," his education is one-sided, incomplete, and he will be a success only at a failing. While, on the other hand, if he knows "how" as so much routine, his vision is narrow, and in his contracted sphere he spends his life in thinking and talking trivial things.

The educated man is the one who can think clearly, speak intelligently, and do well the things he tells how to do. Any education which has not for its object the fitting of the individual to better meet life's duties has no reason to exist. The study of agriculture surely has this. Any education which causes the student to feel "above" the practice of his work is a nuisance. Let us remember the words of Mckay.

"And joy to him who, o're his task,
Remember's toil is nature's plan;
Who working, thinks—and never sinks
His independence as a man."

We should not study agriculture solely that we may be able to grasp more dollars—that would be a low conception—but that we may see life as it is and understand the intimate and delicaie relation that exists between one plant and another, between plants and animals and the relation of both to the soil that produced both. The enthusiasm, the interest that the young farmer finds in his work when he understands that work, not alone the how and the when which are all important to financial success, but the why of this and that and the why not some other way, is uplifting, while principles understood and applied solve many a new problen.

Walking through a field with boots and overalls will not make a farmer of any man. He who runs a farm for ten or forty years and allows that soil to become exhausted and nonproductive deserves not the name of farmer. He is a soil robber; he holds the same relation to the soil that the timber thief does to our forests. This is the kind of farming that has reduced the soil in so many sections and is the same kind that is being practiced now all over the western country. The farmer of the future must be able to take one of these cast-off patches of earth and build a farm on it. How to do this and at the same time not make a slave of one's self is one of the aims of the modern school of agriculture.

As in every other profession, some graduates in agriculture fail—some because they find too much real work attached to the business, some because they are over-enthusiastic for new ventures, and some because they are no good anywhere. You can't temper lead nor polish sawdust. The school is to train, not to create brains. Or, in the language of ex-President Roosevelt "Neither a college training nor anything else can do much good to the man of weak fibre or to the man with a twist in his moral or intellectual make-up. But the average under-graduate has enough robustness of nature, enough capacity of enthusiasm and aspiration, to make it worth while to turn to account the stuff that is in him."

The farm boy of practical bent will find in the study of agriculture vast seas of practical points, all he can ever use, and the highschool graduate with ambition for future greatness in the scholastic world will find in the study of agriculture subjects as deep and as scientific, as broad and as fascinating as in any other pure or applied science. What a field, this, that the agriculturist has! From a study of a tiny germ that sours the milk to the mighty storm cloud that destroys the crops of a province; from a study of the spirit of a fast horse and sensitive cow to the several inanimate though intricate machines.

I tell you, boys, there is room enough here for all of us to grow just as big and just as practical as we can. Study agriculture as you would study law or medicine, and when you are prepared to do the thing of your choice a place will be waiting to be filled. There is now a great increasing demand for men trained in agriculture.

The Nova Scotia agricultural college opens on November 1st, 1910, and we would advise each and every farm boy, who can get away from home, to be present at the opening and take the full course. You will find it the best investment of time and money you ever made in your life. It will go with you to the end of your days and its influence will extend to your posterity.

THE FARMERS IDEAL.

How many people we meet in our daily walks who go on from one day to another in a reckless, careless sort of a way? They seem to be contented to live on year after year without knowing what their ideal is. They do not seem to make any advancement in their lines. They drift from one thing to another; and never stay long enough in any one line to make it a success. They have not studied what their market demands are and have thus failed to cater to the trade. They groan because such and such don't pay; while in reality the main cause of failure lies with themselves. They have not gone into their work with their brains as well as with their hands.

What a contrast to the person who makes a study of the needs of his market, and having studied them have looked about and formed his ideal, and stuck to it. He has not been ashamed to learn the A B C of his business, by beginning at the bottom round of the ladder. When he climbed the ladder steadily, by push and pluck, and finally arrived at the top, he was able to keep his balance. It does not pay to climb the ladder in farming by spectacular steps. It pays to build on a ifoundation that is solid and firm. Producing and selling good goods, accompanied by honest dealings will soon establish for him a reputation which should be enviable.

Hundreds of men have been forming their ideal and beginning small, grown up with their business by perseverance, push and pluck. What men have done others can do.

He who starts upon a journey should have a definate idea as to his destination, otherwise he wanders about aimlessly like a vessel upon the great ocean, without either chart or compass, or even a pilot driven before every wind, and wrecked at last upon the shores of some unknown baren country. Alas! and how many persons finally discover that life has been spent in vain, their energies and strength have been exhausted for naught; and the tree of life, which chould have been laidened with fruit, is barren, containing nothing but leaves.

Farming life, like every other life is a journey, and he who would succeed should carefully consider its aim and end. Farming life is a growth, worthy of being developed along natural and noble lines. Every farmer endowed with the facilties and intelligence accorded to the great mass of people of this country ought to make his work a suceess especially in the present enlightened generation, and in this, the best and greatest country of all civilized nations. It would seem that the only real excuse for failure must be either lack of aim or pure laziness.

Success is sure to crown the labor of any farmer who possesses an average intelligence, a high ideal, a disposition to work, and is willing to bravely face needful trials.

Why is it that so many farmers fail while the opportunities are so great and possibilities so vast? The answer is obvious. They are not willing to pay the price of success, they turn a deaf ear to the warning of others; they ignor the assous of experience, and, with eyes wide open, head their course straight for the rocks where thousands have gone down. Failure never comes to the farmer except when he disregards the laws of nature, by doing his work in a manner contrary to her teachings. Nature is not run on theory, or guess work, but is in accordance with universal facts. When farmers model their work in harmony with her laws, success will be an assured fact.

Nature does not exist in vain. One of the important facts of nature is that men are made to differ greatly in their natural endowments and in their fitness and aptness for particular pursuits. Farmers do not all desire nor would it be desirable that they should do the same kind of work. Thus nature secures a variety of laborers for her various agricultural pursuits. In order then to succeed as a farmer, or in any branch akin to it, one should take an early account of his stock in hand. For what line of agriculture is he and his country fitted? What does his accessible markets demand. Having satisfied himself along these lines let him form his ideal and set it high. This is an age of specialties in agriculture as well as in all other trades. One cannot do all things, but he can do one or two things well. Life is far too short to roam from one branch of agriculture to another. Do not be ashamed to begin at the bottom round of the ladder leading to your ideal. Learn the A B C of the business. Do not take any spectacular steps but climb from step to step and when you get to the top round of the ladder you will be able to keep your balance.

Rotation of Crops.

Editor Maritime Farmer:—

The primary object of a systematic rotation of crops is to obtain from a certain amount of land a larger aggregate of produce than would otherwise be possible. Experiments have strikingly shown the enormous superiority in yields on lands where a rotation has been practised, over those lands where no system has been in vogue.

The reasons for this difference are many. Different plants take the food elements from the soil in very varying proportions, and different plants have also a varying capacity for extracting a particular food element from the same soil. Hence there is a great advantage in having crops so arranged that no two successive ones shall make great demands upon the same plant food.

Almost all our crops are attacked and injured by either some parasite or fungus disease, or by some particular insect. These, during the first year of a crop are often hardly noticeable, but during the second or third year they are extremely liable to so increase and multiply as to completely or partially destroy that particular crop. Where a rotation is practised therefore, the liability of destruction through pests is minimized. The same can be said of weeds. A particular weed is very often found to associate with a particular plant. For example, a different class of weed is found with the hoed crop to those in the grain or in the hay. Thus if one particular crop were grown successively on the same land some particular weed would become a serious pest on that land. There again the advisability of a rotation.

Some plants it must be remembered have the power of obtaining nitrogen from the air, and if properly grown, of leaving the soil richer in nitrogen than before. In a rotation therefore, at least one of the crops should be a nitrogen gatherer in order to obtain the product with the greatest economy.

On a large number of our farms to-day, there seems to be a complete lack of system, and the principles of a rotation seem to be in a measure ignored. Of course the determining of a rotation must of necessity rest with the farmer himself, who should have one adapted to his products.

In order to illustrate a good rotation we will take a dairy farm. The dairy farmer wants hay, some grain, roots, (turnips and mangels) and ensilage for his winter feeding. During the summer he wants a pasture, or soiling crops, or both. The following is an illustration of how such a farm could economically be arranged.

PERMANENT PASTURE OR SOILING CROPS OR BOTH	
1910 Roots and Corn	1910 Grain
1911 Grain	1911 Clover, some grass
1912 Clover, some grass	1912 Hay
1913 Hay, some clover	1913 Roots and corn
1910 Clover, some grass	1910 Hay, some clover
1911 Hay, some clover	1911, Roots and corn
1912, Roots and corn	1912 Grain
1913 Grain	1913 Clover, some grass

The land should thus be divided into four (including pasture), and the rotation would be; first year roots and corn; second year grain, and seeded to clover and grass; third year clover mostly; fourth year grass ostly. The land would be manured once every four years, preceeding the roots and corn. During the first year (the roots and corn) the greatest demand would be made upon the potash and phosphoric acid; during the second year, (grain), chiefly upon the nitrogen and phosphoric acid; during the third year, (clover mostly), chiefly upon the potash; and during the fourth year (grass mostly) chiefly upon the nitrogen which has been stored the year before in the roots of the clover. In this manner the fertility and also the humus content of the soil would be increased.

If some such system as this were to be adopted, land which hitherto has given light yields, could be made to be very productive, and that productiveness would steadily increase with each succeeding year.

A. KELSALL.

Annapolis Co., N. S.

Fall vs Spring Fertility.

Editor Maritime Farmer:—

"When should I apply my fertilizers to get the best results"? is a question one is frequently asked by farmers and it is in some measure responsible for this short article. Under most average canditions we would say "about a month before putting in the crop."

While this is, generally speaking, true there are so many influences which govern this question that it will not be out of place to consider them briefly at this time af year.

The crop to be fertilized is, perhaps, the most important factor in determining the time of application. For crops that are sown late in spring as potatoes, roots and corn, the application can be made in the spring, about a month before the planting. But for fall wheat, hay, pastures and orchards, particularly large fruits, it is necessary, in order to get the best results, to apply the potassic and phosphatic part of the fertilizer in the fall so that it may be available to the plant roots when growth starts in the spring.

Climatic conditions will in many districts determine the time of application in some measure. Where the rainfall is light, especially in late spring and early summer, it has been found thgt fall applications have given certain results. On the other hand where there is a plentiful rainfall most of the year, it is only necessary to make the application a few weeks before seeding, except in the case of the crops mentioned above.

Although perhaps, not of such importance as the foregoing, the nature of the soil does to some extent influence the time of application. A light sandy soil and a soil in poor condition, lacking humus, do not retain moisture very readily. As the fertilizer ingredients are dissolved by the soil water, a part of them might easily be lost by leaching if applied in the fall to this class of soils. These soils can of course be much improped and made more retentive of moisture by thorough cultivation, the liberal use of barnyard manure and the plowing under of cover crops. The heavier classes of soils, i. e., clays, clay loams and those containing a large amount of humus, are wonderfully retentive of potash and phosphoric acid and on these soils the fertilizer can be applied in the fall without any appreciable loss during the winter and early spring.

On the marsh lands of the Maritime Provinces, which, unless thoroughly underdrained, are frequently very wet in early spring, the fertilizers should be applied in the late fall. Recent experiments have proved that these soils, when underdrained, respond readily to an application of potash, phosphoric acid and lime.

The materials used to supply the various "plant food" ingredients will to some extent decide whether the fertilizers can be more profitably applied in spring or fall. This statement is perhaps more particularly true of those fertilizer materials that supply Phosphoric Acid. The most important of these are Acid Phosphate, Basic Slag and Bone Meal. As the former is very readily available to the plant it is not so suitable for fall application as the slower acting Basic Slag and bone meal. Basic slag is used to a rather greater extent than bone meal owing largely to the "acid counteracting" action of the lime which it contains. Bone meal is, however, very effective on light soils and on account of its "lasting" effect is largely used on orchards in some localities. The potash fertilizers, of which Muriate and Sulphate of Potash are the chief, can be applied either in fall or spring. Kainit and wood ashes are sometimes used as a source of potash but, owing to their low potash content and the high cost of transportation, their use can only be recommended under special conditions. Muriate of Potash being a little cheaper than Sulphate is sometimes used for potatoes, and if applied in the fall appears to give satisfactory results as the Chlorine part, which some authorities claim affects the quality of the tubers, is washed out of the soil before the plant roots are able to assimilate it.

The most common of the Nitrogenous fertilizers, viz., Nitrate of Soda and Sulphate of Ammonia, are extremely soluble and should never be applied till spring. Where 'mixed' brands of fertilizers are used the spring would appear to be the best time to apply. However, the rate of availability of any fertilizer ingredient depends upon the source from which it is derived and as the farmer does not know this source in 'mixed' fertilizers he is unable to determine just when the fertilizer should be applied in order to give the best results.

The applying of fertilizers in the fall has this great advantage over spring application, i. e., the plant food ingredients are more readily available just when the growth starts in spring, thus, by promoting a strong vigorous growth, helping the plant to withstand drought and insect attacks.

In conclusion the writer would like to emphasize what was said at the beginning—when fertilizers are applied in spring never delay the application till day or so before seeding but, if at all possible, have the fertilizer harrowed into the soil three or four weeks before hand and the returns from the use of the fertilizer will be larger.

WALTER SHIPLEY.

Cement Tile.

In a recent edition of your paper I noticed an article about cement tile and in this article you asked if any one had practical knowledge on the subject to send it in.

This spring about the first of April I found to my dismay that our tile dealer had sold the last of his tile a short time before I made my inquiry. There we were with nearly a thousand feet of ditch dug and no tile in town, and later I found that the factory had burned and it would be about a year before they would make any more.

Just as we were ready to give the whole deal up my father happened to think of cement tile. We knew very little about them at the time but nevertheless we sent for a mold and commenced operations.

Cement here is $1.40 a barrel and real coarse sand, fifteen cents a load; of course the hauling adds to its value.

One sack of cement we found would make approximately fifty tile. One hundred and fifty tile a day was our average output and without counting the time spent in mixing—which by the way was done with shovel and hoe— this was turning out a tile every four minutes. Now figuring my time at $1.50 a day and the cement at $1.05, the cost would be $2.55 for 150 tile. One hundred and fifty of these tile will only lay 125 feet as they are only ten inches long. Now with clay tile at $18.00 per thousand —tnat is, for the four inch as the cement tile were the same diameter —most anyone would rather have the clay tile if this record could not be beaten. The cost as I said before of the cement tile was $2.55 for 125 feet and 125 feet of clay tile would cost $2.25 which would mean a saving of 30 cents if the clay tile were bought in place of the cement tile. You will notice I have not figured in the cost of the sand, for most farms have a place upon it where good coarse sand can be obtained and the hauling of the clay tile will about equal the hauling of the sand and cement.

At the present date I am prepared to say that the trodble was this: I didn't do enough thinking before I jumped, but after figuring things out and thinking matters over, have come to these conclusions: First, anyone wanting to make cement tile for profit must buy the fastest machine he can find, buy cement in large quantities, use a concrete mixer and have everything handy as possible. Even with our outfit it is well worth our time to make tile on rainy days and at spare moments.

I have a concrete mixer in mind that will save a great deal of time in mixing, for time is the main factor. It can be made by taking a large size barrel and fixing it as follows: Put a long rod through it so the barrel will revolve on a suitable frame work. The rod should be tightly fastened to the barrel and one end of the rod can be bent to form a crank. The barrel should be fitted with a small door and inside the barrel two by fours, about six inches long, should be nailed to help in mixing. It would be a wise idea to have a chute underneath the barrel to slide the mixture to the side of the machine, instead of letting it drop underneath.

A cement tile is far ahead of a clay tile for the following reasons: First, they are stronger; second, more porous; third, they will resist any kind of weather and will not crack or scale; fourth, the older they become the harder they grow, and fifth, they lie as straight as a string with perfect joints.—H. M. Arnold, in Hoards Dairyman.

Of Interest to Fruit Growers.

Last spring the Department of Agriculture undertook to obtain strong well grown, reliable, true to name, apple, pear, plum and cherry trees at especially reduced prices for intending planters of 1911. A large number of orders have been received and as a consequence we are getting these trees for thirty per cent. less than the prices agents throughout the province are quoting per one to five hundred lots. At the same time they are guaranteed to us as strong well grown, two and three year old trees, absolutely true to name and to be delivered at Fredericton next spring in prime condition. Any body wishing to take advantage of this opportunity to obtain reliable nursery stock at cheapest possible rates should write immediately, stating particulars as to site and soil, number of trees to be planted, whether for home or commercial use and preference for certain varieties, if any. To obtain the variety you want all orders should be placed immediately as all nursery stock is selling very fast this year. Address all correspondence at once to A. G. Turney, Fredericton, N. B.

Your cough annoys you. Keep on hacking and tearing the delicate membranes of your throat if you want to be annoyed. But if you want relief, want to be cured, take Chamberlain's Cough Remedy. Sold by all dealers.

HORTICULTURE

Packing Fancy Apples.

After hauling the fruit to the packing house, it is wiped, care being used in removing dust and spray without producing a polish. Then it is sorted according to size and color, fancy grades, choice grades and culls being kept separate.

The fancy grade must consist of perfect apples only. They must be free from worm holes, stings, scale, fungus, scab, rust or any other disease, and free from all insect pests, decay or injury. They must also be free from bruises and limb rubs and the skin around the stem must not be broken. They must be clean, fully matured, not deformed, and of a healthy color.

The choice grade includes those apples a little below fancy and such as are not perfect. They must be good apples, not culls. They must have no worm holes nor broken skin. Limb rubs must not be larger than a dime and only two stings are allowed, but none will be permitted if the skin is broken. Apples affected with San Jose scale, dry rot, or which show an open or black bruise are not allowed, and those with a fungous spot larger than a half inch in diameter must be placed with the culls.

Great care is required in packing fancy Spitzenberg and other red apples that are graded for color. Spitzenbergs must have 70 p. c. of good red color, and special advice is given for other varieties.

Right here the grower's responsibility ends. He has grown the fruit with even greater pains than he has picked, wiped and sorted it. Now he cannot touch the fruit. The packing must be done by strange hands. Such is the law of the union.

When the fruit is in the packing house, the field inspector, a union official of importance is notified. If, in his ouinion, the job is ready for them, the union's skilled packers appear.

Each packer is registered at the office of the union, where he is given an official rubber stamp, an impression of which he must place upon each box of apples that he packs, together with the number of apples that the box contains. He must be able to put up a first-class pack, as it is only upon his ability to do this to place the fruit tightly, with an inch swell in the middle of top and bottom combined, that he manages to retain his position. "Pack full and tight," is continually shouted in his ears. "We want a tight pack, sidewise and endwise, across, up and down, back and forth, but tight, tight, tight." The result is that a bruise is uncommon on a Hood River apple.

When the apples are all packed, covers and cleats nailed upon the boxes, the grower's name and union number placed in the upper right-hand corner of the end, also the post office address, which is required by state law, and the variety and number of apples, from 54 to 128, placed in the centre of the end near the top, then he may haul them to the union warehouse ready for shipment. But do not think that this is done without orders more minute—not much.

The union even says that he must use four nails on the sides of the box, four on the top and four on the bottom, and he must use a 5d barbed or cement coated nail. He must al so haul on springs, and always use a wagon cover. And most i portant of all, he must always pile the boxes of packed apples on the side and load them in his wagon the same way.

Is it any wonder that the world's finest apples at from $2.75 to $3.25 per box, which is equivalent to $8.25 to $9.75 per barrel, are grown in the Hood River valley? With such pains results could be obtained anywhere that the climate is at all suited for apples, and the directions enumerated here apply only to picking and packing—a small part. The growing is even more stupendous.—Guy P. Jones.

PILES CURED at HOME by New Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309, Windsor, Ont.

Attractive Outlook for Fruit Exporters.

It is now quite evident that fruit crops in England are on the whole if not absolutely a failure, at least very short of a fair average, and the outlook for imported fruit is therefore most attractive. Nevertheless, this statement must not be taken without qualification; there will undoubtedly be a strong and continuous demand, sufficient to absorb all and more than all the good fruit which is likely to be sent here. But the mistave too often made by Canadian shippers is to deduce from general scarcity the conclusion that all kinds and qualitics of fruit will be acceptable and meet with a ready sale at satisfactory prices. Even when the quality shipped has been fair, individual exporters have again and again had cause to complain that while their Number 1 apples sold to advantage, the number 2 yielded them little or no return—perhaps enough to pay for the barrels and packing, leaving nothing over for the fruit.

The warning cannot therefore be too often repeated nor too strongly emphasized, that England wants practically unlimited quantities of sound mature apples of standard varieties in good condition, but that on the other hand, the markets are quickly demoralized by shipments of undersized, immature or damaged fruit, and can assimilate only moderate quantities of passable Number 2 apples. As a general rule nothing but disappointment awaits the exporter who attempts in a year of scarcity to make a profit by shipping inferior fruit some thousands of miles by land and sea, to be offered in the English auction markets. Such fruit is infinitely better consigned to the evaporator or otherwise disposed of locally.

How to Grow Fancy Strawberries.

It will pay us to direct our best efforts to the raising of fancy berries and in order to do that we must begin by preparing the soil properly for the plants, set out strong, vigorous plants and then follow that up by clean and thorough cultivation throughout the growing season. Give the plants every possible chance to do their best work in growing and maturing a strong root system as a foundation for a large crop of fine fruit. There is no plant I think, that responds more liberally to good treatment than the strawberry.

All of us know in a general way how to grow fine onions, celery, beets, cabbage, etc. It is done by keeping the soil fertile, thoroughly worked, mellow and free from weeds and grass. Just treat the strawberry plant the same way. It takes lots of labor to give this kind of treatment to a large field of berry plants, but it pays to do it and the man who is afraid or unwilling to go to the expense of proper cultivation had better try something else, for he will be disappointed with results if he neglects to do it.—J. H. Christian.

How to Grade Box Apples.

The Hood River apple growers' union of Oregon packs two grades only, the fancy grade and choice grade, the grading rules are as follows:

This grade consists of perfect apples only. The apples must be free from worm holes, stings, scale, fungus, scab, rust or any other disease, and free from all insect pests, decay or injury.

They must be free from bruises and limb rubs and the skin around the stem must not be broken. All apples must be clean, fully matured, not deformed, and must have a healthy color. Spitzenbergs must have 70 p. c. or more of good color. All red apples must be of a good color.

This grade consists of apples a little below fancy, and includes such apples as are not perfect. These must be good apples, not culls. No apples with worm holes or broken skin will be accepted. Limb rubs must not be larger than a 10-cent piece.

Only two stings are allowed, and no sting is permitted where the skin of the apple is broken. No apple will be accepted with San Jose scale, dry rot, or which show an open or black bruise. Apples showing fungus will not be accepted where the spot is larger than ½ inch in diameter.

Cold Storage of Apples.

The result of some investigations in the cold storage of apples in Iowa has recently been made public. The fruit was held in storage at a temperature of 34 degrees during one winter, and 33 degrees the following winter. Firm, hard, well-colored fruit kept best. Northwestern Greenings of this type remained in good condition a month longer than poorly colored, early picked fruit. Fruit stored immediately after picking was in better condition and lasted longer after removal from storage than samples which were harvested at the same time and kept in an open shed for two weeks before being placed in cold storage.

No advantage was found in wrapping the apples in paper, except with the more tender varieties. With some varieties, such as the Northwestern Greening, no difference was noted between the different ways of packing. Wealthy apples kept best in boxes, bruising was greater in barrels and shrinkage was greater in slat crates than in either boxes or barrels. Practically these same results were obtained some years ago by the federal bureau of plant industry.

Mulch Strawberries.

Mulch strawberries in November. Several reasons may be assigned for mulching the strawberry. It is an evergreen and unlike other plants which drop their leaves in the fall it does not store elaborated sap in its body upon which it may draw to start new leaves in the spring. If left to the effects of drying winds with frequent freezing and thawing the old and even crown leaves will all be dead before spring and as it has no means of elaborating sap its vitality is lowered for want of resources in forming new leaves.

When the ground freezes deep the lower roots are held firm while the sunshine of the day thaws the surface. Freezing follows at night, the ground expands and pulls the roots from the crown or breaks them. At the same time it lifts the crown up but does not allow it to settle down again and the plant is permanently weakened.

The better class of fruit growers now generally propagate their strawberries in a special bed from selected plants so that they can develop them with extra care. If these are exposed to freezing and thawing they will not endure transplanting and long vacancies will be found in the fruiting field.

Cover plants lightly. If the plants are covered with any litter, merely enough to shade the plants, the frost will work into the ground deeply and only dissolve slowly when a long warm spell comes. There will be no heaving or breaking of roots and the leaves will remain bright and green all ready to elaborate sap as quickly as sunshine is admitted in the spring. The plant is then in position to undergo the exhaustive process of pollen making which sets in as soon as growth starts in spring.

Strawberries ought never to be cultivated in the spring but measures must be taken to conserve moisture. Il no mulch is applied the winter rains pack the surface so that the capillary movement of water to the surface is very active and the ground dries out very fast. If no mulch is applied the surface must be broken up exposing the berries to the mud thrown by rain drops striking the loose earth.

The mulch performs the same work as the cultivating and the pickers appreciate it when doing their work. It needs to be raked off directly over the plants so they can come up through. When berries are picked it should be burned on the ground to kill fungi and insects. The mulch should not be put on until the ground freezes. If applied early and a warm spell follows they will bleach and be tender.—Sylvanus Van Aken, Port Ewen, N. Y.

Sweet Cider.

Jacob Faith in Rural World says that ripe, clean apples should be used. The apples should be cut in two, so that if there are any worms they can be cut out. The later cider is made, other things being equal, the better it will keep. Apples, to make good cider, should be ripe and sound, have a rich juice, and a somewhat acid flavor. The fresh-made cider should be placed in openheaded casks set upright, for the scum to rise to the top to be skimmed off. If about a pint of strong wood ashes and the same of lime are put into the forty-gallon barrel it will cause the pomace to rise to the top better. A deposit of fine pomace will settle to the bottom. Care should be taken when drawing or dipping the cider not to disturb these settlings in the bottom of the cask.

Cider can be kept from fermenting by adding one pint of hrated horseradish to forty gallons. Shake barrel well and add about one pint of mustard seed, cork and put in a cold cellar. Cider can be kept sweet for years by putting it up in cans, as in canning fruit. Let fresh made cider stand until settled, then pour or dip it off from the dregs; boil while hot put into bottles or jugs, filling them as full as possible and corking tight, but do not seal. Set in a dark cool place. This cider will improve with age. Cider will keep best when made late in the season. Early-made cider from immature fruit may answer for a few days and then be used for vinegar.

The Raspberry.

The fruit of the raspberry is much sought after, and its uses are numerous. It is fragrant, subacid, cooling and agreeable to the taste. The juice is useful in fevers but its principal use is to make jam.

The land should be free from stumps, roots and stones; it should be cultivated as deeply as possible. It will pay to subsoil land to be planted with the raspberry. It is hardly possible to make the ground too rich. The raspberry succeeds best in a loose, loamy, moist soil, but not wet. It should be planted in hills five feet apart each way, three plants to a hill, or in rows six feet apart, and two feet apart in the row. The first plan requires 3484 plants to the acre, anh the second 3630. After planting, the ground must be kept clean and free from weeds, and the sucker plants not required for next year's canes must be cut off, thus throwing all the strength into the remaining plants. Neper use the plow or cultivate deeply. If you will dig up a raspberry plant you will see the reason for this. The roots are of a two-fold nature, the woody roats feeding the plant and going deep into the ground, while the fine fibrous roots which maintain the fruit are always quite near the surface. Plowing or deep cultivation destroys these roots, and thus reduces the crop. Deep mulching has been found to give excellent results. In the fall the old canes should be cut out and burned.

When danger of hard frost is past in the spring, the fruiting canes should be cut back to about four feet. This causes laterals to be put out, increasing the fruit-bearing wood. If the hill system has been adopted, no staking is required, except in localities where hign winds prepail. Simply tie the tops together.

When planted in rows, two wires should be stretched one foot apart, on the same level, with a heavy post at each end, and lighter ones every rod, to which crosspieces are nailed to carry the wires. The vines are trained between the wires, and the wires tied together every five feet. The average crop should be 450 crates of 24 pounds. The plants should produce a full crop the third year, and if fertility of soil is maintained, the plantation will be profitable for ten or twelve years, or even longer.

Of all the small fruits I believe the raspberry to be the most profitable, but it must be planted on suitable soil and receive proper care at the right time.

Prices are renumerative, and will continue to be so. The demand on the prairies and in our own cities and towns is increasing much faster than our plantings.—Fruit Wagazine.

To those who suffer sickness, to those who want to be well, we say let us buy a 50-cent bottle of Psychine from your druggist and give it to you free to prove. .

The white corpuscles of the blood—the Phagocytes, as they are known scientifically—are the policemen or the scavengers of the body.

Not a germ of disease can invade the body anywhere but these white corpuscles get after it. And, if they are strong enough or in sufficient numbers, they devour it.

If they're not strong enough or in sufficient numbers, then the invading army of disease germs triumphs and disease holds the body.

Any preparation that strengthens these white corpuscles or that increases their number, will not only preserve health, but will build up its defences so strongly that contagion or infection are impossible.

* * *

Herbs have always been great curative agents from time immemorial.

They have been styled nature's own remedies.

Certain herbs more than others are noted for their curative powers.

And it has been found that those herbs that are most effective in maintaining or restoring health, do so by building up the white corpuscles or Phagocytes.

* * *

These herbs are incorporated in Psychine.

And it is the tremendous curative power of these herbs that is responsible for the unequalled record of this splendid preparation.

Think of it. In Psychine we have a preparation that has been in use a third of a century. That has cured hundreds of thousands of many kinds of diseases.

For which we have received hundreds of thousands of unsolicited testimonials.

Here are the diseases for the treatment of which Psychine is indicated:

La Grippe	Bronchial Coughs
Bronchitis	Weak Lungs
Hemorrhages	Weak Voice
Sore Throat	Spring Weakness
Anaemia	Early Decline
Female Weakness	Catarrhal Affections
Indigestion	Catarrh of Stomach
Poor Appetite	Night Sweats
Chills and Fevers	Obstinate Coughs
Sleeplessness and	Laryngitis and
Nervous Troubles	Dyspepsia

After-effects of Pleurisy, Pneumonia and La Grippe.

Now we don't ask you to take our word for the tremendously beneficial effect of Psychine. Fill out the coupon below, mail it to us and we'll give your druggist an order (for which we pay him the regular retail price) for a 50-cent bottle of Psychine to be given you free of cost.

We will undoubtedly buy and distribute in this manner hundreds of thousands of these 50-cent bottles of Psychine.

And we do that to show our entire confidence in this wonderful preparation.

A confidence that has been based on our third of a century's experience with this splendid preparation with a full knowledge of the hundreds of thousands of cures it has made.

COUPON No. 77

To the Dr. T. A. SLOCUM, Ltd.
193-195 Spadina Ave., Toronto

I accept your offer to try a 50c. bottle of Psychine (pronounced Si-keen) at your expense. I have not had a 50c. bottle of Psychine under this plan. Kindly advise my druggist to deliver this bottle to me.

My Name.....

Town.....

Street and Number.....

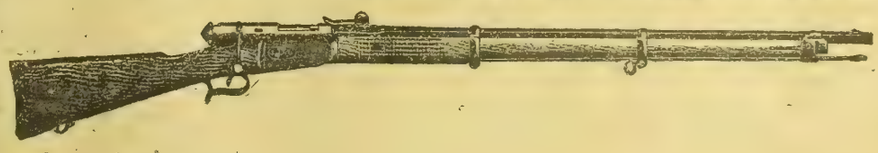
My Druggist's Name.....

Street and Number.....

This coupon is not good for a 50c. bottle of Psychine if presented to the druggist—it must be sent us—we will then buy the 50c. bottle of Psychine from your druggist and direct him to deliver it to you. This offer may be withdrawn at any time without notice. Send coupon to-day.

ONE OF THESE "SWISS ARMY" RIFLES FOR SEVENNEW SUBSCRIBERS

We have purchased several hundred Swiss Army Rifles. They are repeating Rifles, holding 12 cartridges, 42 calibre, in the magazine and one in the chamber. The action is the reliable bolt type, and works quickly and smoothly. The barrel is rifled and is sighted for long ranges. The front sight is open and the rear sight adjustable for elevation. **Guaranteed perfect.** This is the famous "Swiss Army" rifle. It is splendid for hunting deer and larger game etc. No one living in the country should be without one of these rifles. Only a limited number to be obtained. If you want one you should start to-day to secure seven new subscribers. If you intend earning a rifle drop us a card to-day and one will be reserved for you as long as they last. Don't delay, start to-day.



Address—**MARITIME FARMER, Sussex, N. B.**

A Case Of "Wooden Leg"

Would you hire a man with a wooden leg? Hardly! A wooden leg is a poor substitute for real leg power. You would want a man with two good legs—full leg power—no substitutes.

Disks and other contraptions in common cream separators are like wooden legs—they are mere substitutes for lack of skimming force resulting from a wrong principle of construction. A properly built separator produces plenty of skimming force to do the work without disks or other substitutes. Claims that contraptions are needed in modern machines are disproved by the fact that

Sharples Dairy Tubular Cream Separators

contain neither disks nor other complications, yet produce twice the skimming force, skim faster and twice as clean as common machines. Wash many times easier and wear several times longer in consequence. The World's Best. The manufacture of Tubulars is one of Canada's leading industries. Sales exceed most, if not all, others combined. Probably replace more common separators than any one maker of such machines sells.

NAME.....

ADDRESS.....

Canadian National Apple Show.

With the success af the first Canadian National Apple Show from an exhibition standpoint now assured there is every indication of a large attendance of visitors from the entire Province of British Columbia, and even throughout the Dominion.

The management believes that every obstacle to the success of the big undertaking has now been removed by the Canadian Pacific Railway Company granting a one way first-class fare for the round trip from all points in the Dominion of Canada, and in addition to that have granted selling dates in advance of the regular selling dates to the public, for the benefit of the exhibitors, thus giving to all exhibitors the same privileges as granted to the public.

Exhibitors tickets will be sold on the certificate plan. The dates of selling for British Columbia, Alberta and Saskatchewan being Friday, October 21st, to Saturday, October 29th. Any exhibitor desiring the advantage of the one fare round trip rate must notify the Secretary of the Canadian National Apple Show, who will furnish him with a certificate. This certificate on being presented to the nearest C. P. R. ticket agent entitles the holder to a ticket to Vancouver and return at lowest one way first-class fare. No certificate will be required on the open selling dates to the public.

Judges and exhibitors' tickets on certificate plan will be sold October 21st to October 29th.

From all points east of Port Arthur on the C. P. Ry. tickets to general public will be sold on certificate plan October 24th to October 26th, going transit limit Nov. 5th. Return tickets will be honored at Vancouver up to and including November 30th, returning to starting point by same route travelled on going trip and reaching final destination not later than Dec. 7th. Both going and returning tickets fro Maritime Provinces will be good to stop over at Port Arthur and points west thereof within transit limit only. These tickets must be validated by joint agent T. C. P. A. at Vancouver.

For judges and exhibitors only tickets may also be obtained Oct 17, at points east of Port Arthur.

The Halifax Exhibition.

(Continued from last issue.)

GUERNSEYS were shown by Roper Bros., Charlottetown, P. E. I.; Howard W. Corning, Chegoggin, N. S.; T. D. Blaikie, Great Village, N. S., and Lewis R. Rose, Urbania, N. S.

Mr. Rose is not unknown at Maritime fairs, he is a butter maker of note and is welcomed into the show ring circle with his first pure bred Guernsey bull, Prince of Roseland, second in the senior bull calf section. Roper Bros., and Mr. Corning are now old hands at the show ring game and had their herds out in good condition. Mr. Corning only showed some of his younger animails, as his cows are entered in official records tests, he is giving them every possible chance to make good records and consequently he did not care to disturb them by bringing them to the fair. T. D. Blaikie has not been showing for a number of years.

There were three bulls in the aged class. Roper's Golden Opinion led the way with Allison McDonald's Gypsy, a close second, and Blaikie's Knight Eaton in third place.

Roper Bros. had the only two-year-old bull.

H. W. Corning' s senior yearling bull, Island Prince of Hillside, had no competition in his section but he was good enough to capture the diploma for best bull, any age. Corning's Queen's First Boy was at the head of the junior calf class. In the senior yearling class, Corning's Pansy's Image captured the blue ribbon. Bonnie's Image and Columbine's Image, two of Corning's junior yearling heifers won second and third monies in their class, while his Dairymaid's Image led the Senior heifer calf class. Blaikie had the third prize senior bull calf, the third prize two year old heifer and the third prize aged herd. All the other prizes in this class went to the Roper herd, their Dolly of the Villet being champion female any age.

HOLSTEINS made a strong showing with Samuel Dickie & Son, Truro, N. S.; E. E. Armstrong, Falmouth, N. S.; Lea & Clark, Victoria, P. E. I., and Gavin Harding, Graham's Road, P. E. I., out with their very best.

Mr. Armstrong is a new beginner in show ring circles, and will be heard from later. He had first and third junior bull calves and third young herd.

S. Dickie & Sons led the way in the aged bull class, with Sir Rooker Posch Artis, the senior champion at the Dominion fair and with him were again able to capture the male championship, and the diploma for bull and three of his get. Their Helbon DeKol's Prince was third prize winner in the two-year-old bull section and their Countess Lahonda and Cobequid Orne Rooker captured the blue ribbons in the two-year-old senior yearling heifer classes, respectively. Their aged herd stood in second place. Gavin Har.ing, who made his initial bow to mainland exhibitions, at Halifax, succeeded in capturing the second prize on aged bull, with his Artis Jake, a son of Artis Mercedes Posch, and first on his two-year-old bull, Molly's Prince Posch, champion at Charlottetown, and leader of the third prize aged herd. Harding's Count Merecna Vale was sandwiched in, in second place, between two of Lea & Clark bulls in the senior calf class and headed the second prize young herd.

In the junior calf class, another Harding bull, Abbkerk Posch, was sandwiched between the first and third Armstrong bulls. Ontario Maid and Mercena Jewel, two cows with records of 14½ and 16½ pounds butter, respectively, as two-year-olds, came in for second and third monies in the three-year-old cow section. Harding also had the first and third prize winners in the two-year-old and senior yearling heifer classes in Jacoba DeKol and Tanta Rooker, in the former section, and Artis Mink Mercides and Molly Jacoba in the latter.

Second and third ribbons were captured by Harding in the junior yearling heifer class on Miss Mercena Posch and Nanuet Carlotta and in the seniar calf class on Jewel Sylvia Mercena DeKol and Nanuette Pauline. Lea & Clark's Sir Wilfred DeKol I., was third in the aged bull class and their Victor of Fair Mead was second in the two-year-old bull class. Their Ida Rooker II's Vale and Bob Dorindo, the latter a champion at the Dominion fair were the only bulls in the yearling bull sections. Lea & Clark calves also stood in first and third positions in the senior bull calf class.

In a class of seven aged cows Lea & Clark's Mary Rooker II, Jacoba Emily and Jacoba Johanna downed all competition and marched back to their stalls flying the red, blue and white ribbons. Mary Rooker II, also captured the additional coveted honor of diploma for best female, any age.

The three-year-old cow class was led by Lea & Clark's Johanna Mercedes Posch. They also led the junfor yearling heifer class, with Aaggie VanVoran DeKol, as well as capturing similar honors in the senior and junior calves classes.

Jacoba Johannna, one of the Lea & Clark aged cows carried off the diploma for cow and two of her progeny. Howard W. Corning had the second prize junior heifer calf. Lea & Clark led the way in the aged and young herds sections.

CHAMPION DAIRY HERD.

A five piece silver tea service, offered by M. S. Brown & Co., Jewellers, Halifax, N. S., for the best herd, of any pure breed, consisting of: 1 bull, 2 cows, 4 yrs. old; 2 cows 3 yrs. old; 2 heifers, 2 yrs. old, and 2 heifers, 1 year old, was competed for by M. H. Parlee and McIntyre Bros., with their Ayrshires, Roper Bros., with their Guernseys, Josselyn & Young and H. S. Pipes, with their Jerseys and Lea & Clark with their Holsteins. The judges in this class, which was judged in front of the grand stand, between two heats of a race were: W. F. Stephen, Huntingdon, Que.; Prof. Geo. E. Day, Guelph, Ontario; Prof. E. S. Archibald, Truro and R. Robertson, Nappan.

After careful inspection and summing up of the merits of the various herds the coveted trophy was won by Parlee's Ayrshires.

DAIRY GRADES.—There was not so much competition in the dairy grades' classes as we have seen, at Halifax, in other years, but some excellent producers were shown. The Holstein-Friesian Silver Cup for the best grade cow, if sired by a registered Holstein bull, was captured by Lea & Clark with a high-grade Holstein heifer. A full list of the awards will be found on another page.

GRADE BEEF CATTLE of good quality were shown by W. W. Black, Wm. O'Brien & Sons, Wm. Robinson, Victor W. Aylward and Allison McDonald. Hereford grades predominated and carried off all the first prizes.

FAT CATTLE classes were fairly well filled. Wm. O'Brien & Sons had the second prize two-year-old steer and the second prize pair of steers, under three-years-old. James McNeil, Windsor, N. S., had the only entry in the section for steers, over 3 years old. C. A. Archibald had the second and third three-year-old cow, the third prize yearling heifer and the first prize heifer calf. W. W. Black captured all the other prizes including eight firsts in this class.

WORKING OXEN AND STEERS.—were shown by Wm. O'Brien, Woodworth Bros., and S. A. Bowser and were a creditable lot.

SHEEP

were not out in as strong numbers as in former years but the quality was up to the high standard. Leicesters were shown by Albert Boswall, Pownall, P. E. I., and S. L. Boswall.

John Tweedy, H. H. Churchill and H. W. Corning were out with good flocks of Cotswolds.

Earl B. Boswall, Chas, Symes and Albert Boswall, Jr., had some good Lincolns.

Geo. L. Boswall, Cephas Nunn and Lewis R. Rose were the only exhibitors of Shropshires.

The Southdowns were all owned by J. E. Baker & Sons and Cephas Nunn.

J. E. Baker & Sans, A. H. Boswall and Chas. Symes had everything their own way with good flocks of Oxford Downs.

Cephas and Oliver Nunn were exhibitors of Hampshire Downs.

Chas. Symes had no competition with his Cheviots.

E. Servant, Geo. L. Boswall and Cephas Nunn locked horns in the Dorset classes and Albert Boswall and Earl B. Boswall showed some

Farmers Do Exceptionally Well

——As Agents for the——

Empire Cream Separators

1st.—Because no selling experience is necessary.

2nd.—Because one farmer understands the other.

3rd.—Because the Empire Cream Separator is the easiest to clean, easiest to turn and easiest to sell.

4th.—Because selling separators can be done at odd times without neglecting farm work.

5th.—Because the makers of Empire Cream Separators stand behind every machine.

6th.—Because there is no fault-finding after machine has been placed.

LIQUID CURES ECZEMA WHERE SALVES FAIL

In regard to skin diseases, medical authorities are now agreed on this:

Don't imprison the disease germ in your skin by the use of grasy salves, and thus encourage them to multiply A true cure of all eczematous diseases can be brought about only by using the healing agents in the form of a liquid.

WASH THE GERMS OUT.

A simple wash: A compound of Oil of Wintergreen, Thymol, and other ingredients as combined in the D. D. D. Prescription. This penetrates to the disease germs and destroys them, then soothes and heals the skin as nothing else has ever done.

A trial bottle will start the cure, and give you instant relief. Write for it today to the D. D. D. Laboratories, Dept. F. M., 49 Colborne St., Toronto.

For sale by all druggists.

Hoarseness in a child subject to croup is a sure indication of the approach of the disease. If Chamberlain's Cough Remedy is given at once or even after the croupy cough has appeared, it will prevent the attack. Contains no poison. Sold by all dealers.

We are the largest m'f'g'rs in Canada.

The James Bros. Foundry Co., Perth, Ont.

Suffolks in the class for any other variety sheep.

There was a strong class of long wool grades. Albert Boswall, H. W. Corning and Albert Boswall, Jr., were the principal competitors.

In the medium wool class, J. E. Baker & Sons, Cephas Nunn and Almon Boswall were the only competitors.

Albert Boswall, S. L. Boswall and Chas. Symes captured all the monies in the long wool, fat sheep class and Jas. E. Baker & Sons had everything their own way in the medium wool, fat classes.

The condition of the sheep in the respective classes was such as would incite a lively interest in "Golden Hoofs."

SWINE.

There was very little competition in the Swine classes, but the quality was such as could stand the onslaughts of strong company. With the exception of the third prize on boar, under six months, which went to H. W. Corning, every prize in the Berkshire class was captured by Mr. Peter Brodie, Little York, P. E. I.

C. J. Keillr and A. G. Nicholson. were the heaviest competitors in the Yorkshire sections and won out in the order named.

H. W. Corning showed the first prize boar, over 6 months and under 1 year, and Stephen H. James, Halifax, N. S., had the second prize boar under 6 months.

H. W. Corning, A. J. Nicholson and Lewis R. Rose had their fingers in the Chester White competition.

Poland Chinas were shown by Chas. Symes and J. E. Baker & Sons showed their Duroc Jerseys. C. J. Keeler, Jas. H. Stephen and Peter Brodie exhibited grade swine, Bacon Hogs and Fat Pigs.

THE POULTRY

Owing to the lack of accomodation and proper light, in the old poultry house, the poultry coops were located this year in the old transportation building.

There were upwards of 1,200 entries. There was a fairly strong showing of the Asiatic breeds, particularly in the aged Light Brahma section.

The showing of aged Barred Rocks was smaller than it has been for years, there being only four old birds in the whole show. There was a great lot of young Rocks. In the Wyandotte classes, Silvers, Goldens and Whites were out in strong numbers. Spangled Hamburgs excelled all other Hamburg classes in point of numbers. Leghorns in white and Brown, Single Comb varieties, were particularly strong in the cockerel and pullet sections. Single Comb Black Minorcas were there in abundance. Buff Orpingtons sections had a large number of entries. The other classes had about enough entries to capture all the money that was offered.

Turkeys, ducks and geese made a strong showing in their respective classes.

Ornamentals and Pet Stock were there in abundance. J. P. Landry, of the College Farm, assisted Judge Smith and everything was done satisfactorily.

The Superintendents, their assistants and the untiring secretary, M. McF. Hall and his efficient, obliging office staff made matters as smooth as possible for exhibitors and visitors. The fair is over and whether there be a deficit or not let the public remember that a deficit at Halifax sounds worse than it really is, as the Halifax exhibition does its work without a large government grant as is usually received by other fair associations, the rule being that any deficits, incurred is equally saddled by the Provincial Government and the City of Halifax.

WINDSOR DAIRY SALT

Every farmer's daughter and every farmer's wife knows

They all use it—for making delicious butter for their own table. They found out years ago that Windsor Butter Salt dissolves quicker, works in easier, and helps butter to keep better.

Windsor Salt is absolutely pure and every grain is a perfect crystal. 42

If you want to get "top" prices for your butter, use Windsor Butter Salt.

EUREKA

SANITARY CHURN

10 A

There's no comparison between the ordinary wooden churn and the "EUREKA". Barrel is stoneware—top is clear glass.

Besides being absolutely sanitary, the glass top enables you to see how the churning is coming along without opening the churn.

Also made with Aluminum top.

The "EUREKA" is the easiest churn on the market to operate. By tilting back the frame until the weight rests on the wheels, the churn can be quickly and easily moved—while the barrel remain upright.

If your dealer does not handle the "EUREKA," do not take a substitute but write us for catalogue.

Bull, senior yearling—1, Wm. O'Brien & Sons; 2, W. W. Black.

Suffered For Years From Pain In The Back and Headache.

Pain in the back is one of the first signs showing that the kidneys are not in the condition they should be, and it should be attended to immediately for, if neglected, serious kidney troubles are likely to follow. There is no way of getting rid of the backache except through the kidneys, and no medicine so effective for this purpose as Doan's Kidney Pills.

Miss Ida J. Dorian, 28 Spring St., Charlottetown, P.E.I., writes:—"I have received most wonderful benefit from taking Doan's Kidney Pills.

"I suffered for years from headaches and pain in the back, and I consulted doctors and took every remedy obtainable but without any relief until I began taking Doan's Kidney Pills. This was the only medicine that ever did me any real good, as after using several boxes I am now entirely free from all my dreadful headaches and backaches.

"I will always recommend your medicine to any of my friends who are troubled as I was."

Price 50c per box, or 3 boxes for $1.25, at all dealers or mailed direct by The T. Milburn Co., Limited, Toronto, Ont.

When ordering direct specify "Doan's."

A Woman Who Sees This Washer

will want it right away. The "Puritan" takes all the work out of wash day—in fact, it does away with wash-day because a big family wash can be done in an hour. Improved roller gear and other exclusive features mean quick, easy washing.

Churning made easy with the "Favorite" Churn—a national favorite.

If your dealer does not handle these two labor-saving devices, write us. 68

Amatite ROOFING

Ideal for Farm Buildings

AMATITE is the ideal roof for farm buildings. No other approaches it in economy or durability. Here are some of its features:

1. *Low Price.* Amatite costs, weight for weight, about *half* as much as ordinary smooth surfaced roofings.

2. *No Painting Required.* Amatite costs absolutely nothing to maintain because it has a *real mineral surface.*

3. *Absolutely Waterproof.* Amatite is waterproofed with coal tar pitch, *the greatest waterproofing compound known.*

4. *Easy to Lay.* No skilled labor is needed for Amatite. It is just a matter of nailing down.

5. *Stormproof.* Amatite is not a flimsy, paper-like felt. It is one of the heaviest and the most substantial ready roofings made, weighing 90 lbs. to the square, against 40 to 50 of material in the ordinary "Rubber" roofings.

The three important points to be remembered are that Amatite has a *real mineral surface,* that it *needs no painting,* and is waterproofed with *Coal Tar Pitch.* You are only sure of getting them in Amatite.

We send samples free to everybody that asks for them. Drop a postal to our nearest office.

Steer, 3 yrs. old and under 4—1, W. W. Black.

DR. J. WOODBURY'S HORSE LINIMENT

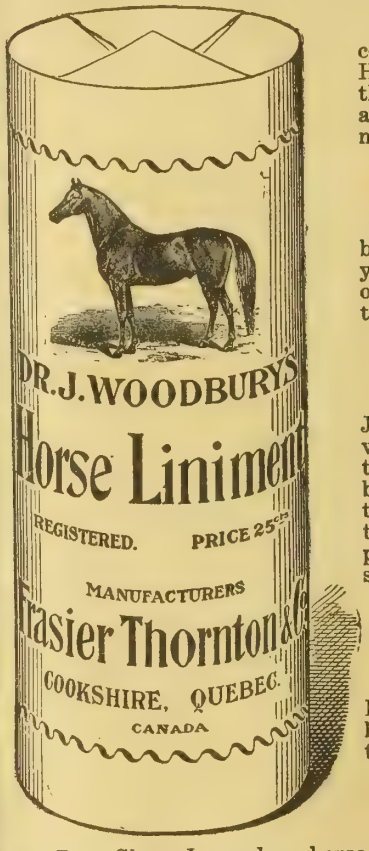
INFALLIBLY THE REMEDY

For the removal of Splints, Bog Spavins, Enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough, Enlargements of the Glands, Affections of the Kidneys. For Distemper, Strangles and Colic it is infallibly the remedy.

All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the fore feet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured.

Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions.

Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.



Bear River, N. S.

Dear Sirs:—We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it. Yours truly,

CLARKE BROS.

Hubbard's Cove, N. S.

Dear Sirs:—I have used Dr. J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use. Yours truly,

C. C. McLEAN.

Truro, N. S.

This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung diseases. It is the best thing to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities, which may exist, and gives the system healthy action.

NEWTON LEE,
Owner "All Right," 5817.

Elmsdale, N. S.

Dear Sirs:—Kindly send me 6 dozen Dr. J. Woodbury's Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take.

Yours truly,
ELMSDALE MERCANTILE CO.,
Elmsdale, N. S.

Dear Sirs:—I cured my horse with Dr. J. Woodbury's Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse.

Yours truly, H. R. WHITEHEAD.

Dear Sirs:—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months' standing. In my large experience with horses, I consider this liniment to be the best made for all diseases in the horse, and I recommend it to my friends. E. J. ANDERSON, Truro, N.S.

AN INVITATION

is extended to you to come and examine our display of Gourlay Pianos. Even if you are not yet ready to purchase, come now and spend an hour in seeing and hearing these superb instruments.

Gourlay Pianos

are all of one quality—the best. The lowest priced style is as well made as the highest. The ambition of the makers of Gourlay Pianos is not to make the greatest number of instruments, but to make each one so rich in tone, so responsive in action, so artistic in design and so durable in every way that it will bring prestige and added reputation.

If you cannot come in write for Catalogue and prices.

Gourlay, Winter & Leeming,
188 Yonge St., . . Toronto.

MORE PINKHAM CURES

Added to the Long List due to This Famous Remedy.

Glanford Station, Ont.—"I have taken Lydia E. Pinkham's Vegetable Compound for years and never found any medicine to compare with it. I had ulcers and falling of the uterus, and doctors did me no good. I suffered dreadfully until I began taking your medicine. It has also helped other women to whom I have recommended it."—Mrs. Henry Clark, Glanford Station, Ontario.

Gardiner, Me.—"I was a great sufferer from a female disease. The doctor said I would have to go to the hospital for an operation, but Lydia E. Pinkham's Vegetable Compound completely cured me in three months."—Mrs. S. A. Williams, R. F. D. No. 14, Box 39, Gardiner, Maine.

Because your case is a difficult one, doctors having done you no good, do not continue to suffer without giving Lydia E. Pinkham's Vegetable Compound a trial. It surely has cured many cases of female ills, such as inflammation, ulceration, displacements, fibroid tumors, irregularities, periodic pains, backache, that bearing-down feeling, indigestion, dizziness, and nervous prostration. It costs but a trifle to try it, and the result is worth millions to many suffering women.

If you want special advice write for it to Mrs. Pinkham, Lynn, Mass. It is free and always helpful.

KENDALL'S SPAVIN CURE

is the remedy you can depend on. No other preparation has done so much for the horse and the horseman.

Kendall's Spavin Cure has saved **millions of dollars** for thousands of owners during the past 40 years. It is the quick, sure, safe cure that never fails to give the best results even when all other treatment may prove a failure.

KENDALL'S SPAVIN CURE

cures Spavin, Curb, Splint, Ringbone, Swellings, Bony Growth, Cuts, Sprains, Bruises and all Lameness.

Kendall's Spavin Cure makes a **complete and lasting cure** because it cures the **cause** of the trouble.

It leave no scars or white **hairs** because **it does not blister.**

Every Medicine Shelf

should have a bottle of Kendall's Spavin Cure — the best liniment in the world for man and beast. No telling when you will need it. Get it now and you will have the right remedy when the emergency arises.

$1 a bottle — 6 for $5. At all dealers. Ask for free copy of our book "A Treatise On The Horse"— or write us.

Temporary Heat Quickly

Did you ever stop to think of the many ways in which a perfect oil heater is of value? If you want to sleep with your window open in winter, you can get sufficient heat from an oil heater while you undress at night, and then turn it off. Apply a match in the morning, when you get out of bed, and you have heat while you dress.

Those who have to eat an early breakfast before the stove is radiating heat can get immediate warmth from an oil heater, and then turn it off.

The girl who practices on the piano in a cold room in the morning can have warmth from an oil heater while she plays, and then turn it off.

The member of the family who has to walk the floor on a cold winter's night with a restless baby can get temporary heat with an oil heater, and then turn it off. The

PERFECTION SMOKELESS OIL HEATER

Absolutely smokeless and odorless

is invaluable in its capacity of quickly giving heat. Apply a match and it is immediately at work. It will burn for nine hours without refilling. It is safe, smokeless and odorless. It has a damper top and a cool handle. An indicator always shows the amount of oil in the font.

It has an **automatic-locking flame spreader** which prevents the wick from being turned high enough to smoke, and is easy to remove and drop back so that the wick can be cleaned in an instant.

The burner body or gallery cannot become wedged, and can be quickly unscrewed for rewicking. Finished in japan or nickel, strong, durable, well-made, built for service, and yet light and ornamental.

Dealers Everywhere. If not at yours, write for descriptive circular to the nearest agency of the

The Imperial Oil Company,
Limited.

Handsome Coat for the Little One.

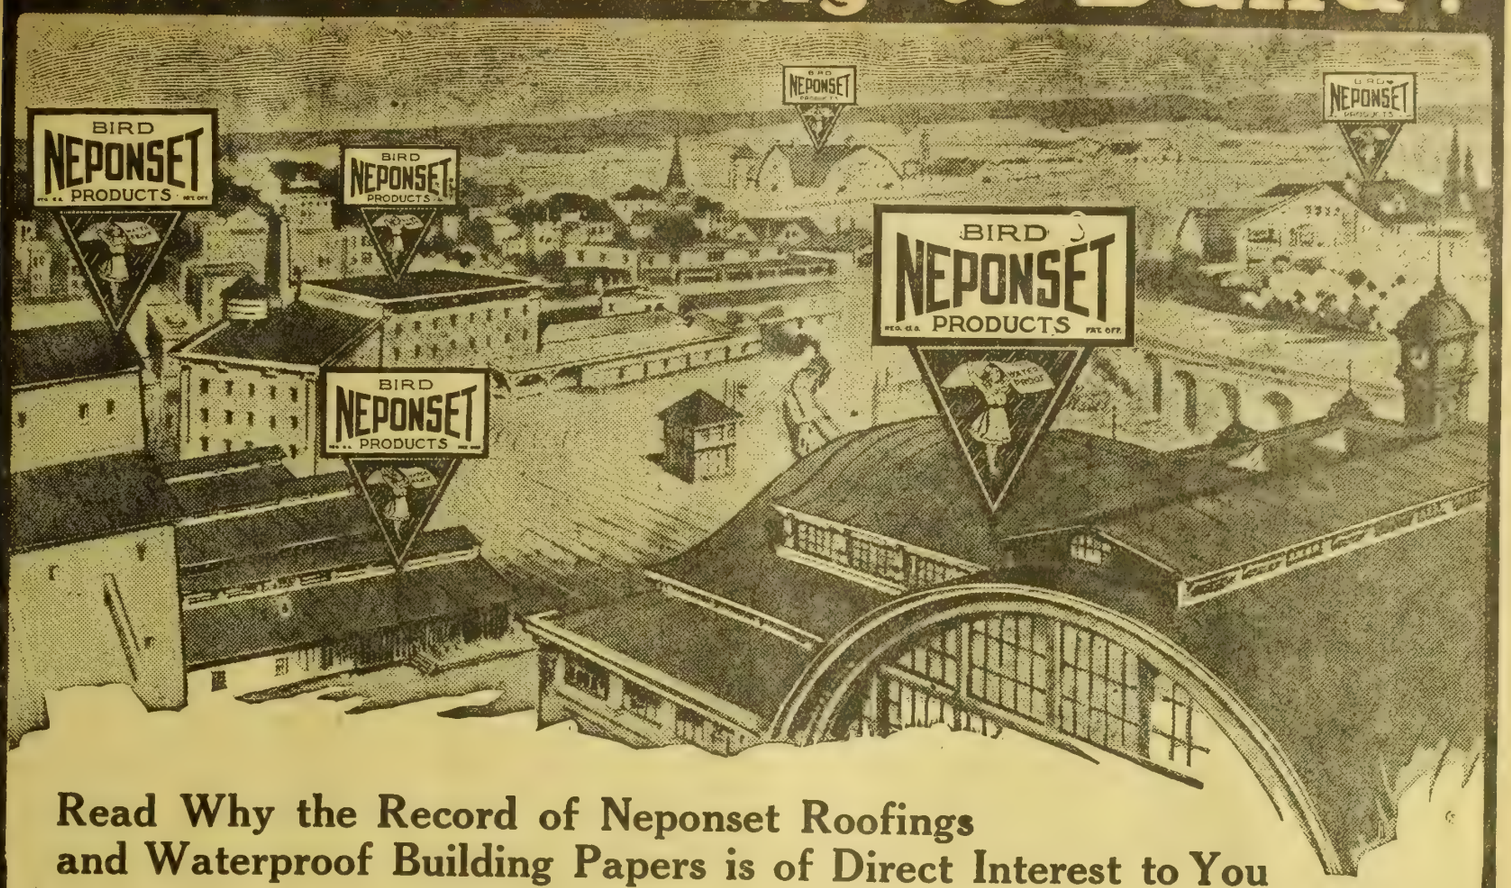
Are You Going to Build?



Read Why the Record of Neponset Roofings and Waterproof Building Papers is of Direct Interest to You

During the last twenty years the great Railway systems of this continent have bought over 75 million square feet of Neponset Roofings in addition to other Bird Neponset Products.

In the same period in Canada and the United States the Departments of the Government, Manufacturers, Farmers and Poultrymen have used many million square feet of Bird Neponset Products.

For a quarter of a century, leading architects and engineers have specified Neponset Waterproof Building Paper. It is the recognized standard for high-grade work. Over 75% of the refrigerator cars built in this country are insulated with Neponset Insulating Paper.

Two Hundred Million (200,000,000) Square Feet of Bird Neponset Products Sold in 1909

Bird Neponset Products will do for you what they have done so long for thousands of others.

Whatever class of buildings you are interested in, whether it be dwelling, factory, train-shed, grain elevator, barn or poultry shed, there is a Bird Neponset Product you should know about. There are special Neponset Roofings for different types of buildings and special Neponset Waterproof Building Papers for every building purpose.

Bird Neponset Products are manufactured by a firm that has been in one line of business for one hundred and fifteen years. Starting with one small mill in 1795, we now operate three large plants in the United States; two in Canada, sales offices and warehouses in both countries and agencies in all parts of the world.

We are the originators of the Ready Roofing idea and are the only manufacturers who make the entire product from the felt to the fixtures.

Bird Neponset Products are made from the highest grade materials by experts long trained to their task and tested and retested at every stage in the manufacturing process. That is why they yield most service and wear the longest.

Our claims for Bird Neponset Products rest on proof.

In every part of the country we can point to buildings which demonstrate all we claim. Test this for yourself by being shown in your vicinity a Neponset Roofing of the character you require. See for yourself exactly what you may expect of a Bird Neponset Product. Talk with the owner of the building, learn what he has found by actual experience.

Bird NEPONSET Products

Roofings and Waterproof Building Papers

NEPONSET Proslate Roofing: For roofs and sides of residences, club-houses, and all other buildings requiring artistic roofing and siding. Rich brown in color. Looks like shingles, wears like slate. Suggestions furnished for making buildings more attractive with Proslate.

NEPONSET Paroid Roofing: For roofs and sides of farm, industrial and railroad buildings. Slate in color. Has proved its worth by years of use, in all climates. Endorsed by the National Board of Fire Underwriters for its fire-resisting qualities.

For poultry buildings, brooder houses, sheds and temporary buildings, **Neponset Red Rope Roofing** is unequalled. It has been the standard low-cost roofing for 25 years, lasts three times as long as tarred felts.

NEPONSET Waterproof Building Paper: For use in residences under clapboards and shingles, in the walls, or under slate, metal, tile and similar roofs. Saves one-third the fuel bills every winter and prevents damp walls and draughts.

NEPONSET Florian Sound-Deadening Felt: For use in residences, under floors, between partitions and under metal roofs. Based on the dead-air-cell principle, it is the most effective muffler of sound and entirely sanitary. It is vermin proof.

NEPONSET Waterdyke Felt: For waterproofing foundations, bridges, tunnels, etc. Specified by all the foremost architects and engineers.

ARCHITECTS, ENGINEERS AND OWNERS are invited to consult with our Engineering Department upon any waterproofing problem they may have to solve. Write us and we will send one of our experts to the office.

OUR BUILDING COUNSEL DEPARTMENT is placed at the disposal of anyone that is building or repairing. Give us full particulars and we will gladly give you expert advice on any roofing or waterproofing question.

BIRD NEPONSET PRODUCTS

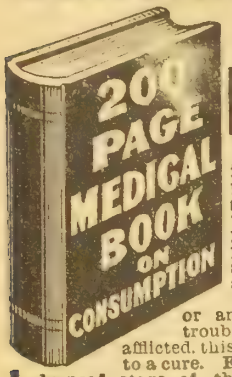
Consumption Book FREE

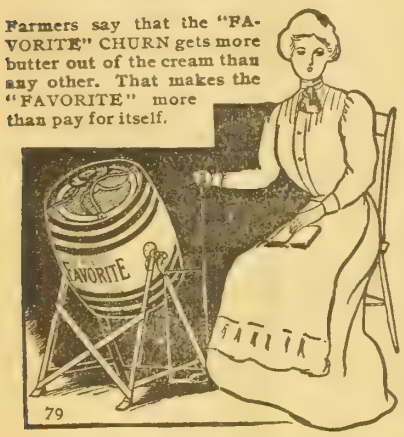


This valuable medical book tells in plain, simple language how Consumption can be cured in your own home. If you know of any one suffering from Consumption, Catarrh, Bronchitis, Asthma or any throat or lung trouble, or are yourself afflicted, this book will help you to a cure. Even if you are in the advanced stage of the disease and feel there is no hope, this book will show you how others have cured themselves after all remedies they had tried failed, and they believed their case hopeless.

Write at once to the Yonkerman Consumption Remedy Co., 1622 Rose Street, Kalamazoo, Mich., and they will send you from their Canadian Depot the book and a generous supply of the New Treatment, absolutely free, for they want every sufferer to have this wonderful cure before it is too late. Don't wait — write today. It may mean the saving of your life.

MORE BUTTER AND BETTER BUTTER

Farmers say that the "FAVORITE" CHURN gets more butter out of the cream than any other. That makes the "FAVORITE" more than pay for itself.



The "FAVORITE" churns smoother butter, too—better butter.

Easiest running because of roller bearings —strong, durable—with hand lever and foot tread. 8 sizes, to churn from ½ to 30 gallons of cream.

Every woman, who washes clothes, ought to have a "PURITAN" WASHER.

If your dealer does not handle the "FAVORITE" or "PURITAN", write us.

The electrically-welded, solid-piece frame gives strength and stiffness to

Peerless Farm and Ornamental Gates

We build Peerless Gates to last a lifetime—handy, convenient and attractive. They remain staunch and rigid through all kinds of rough usage. The frame is made of heavy steel tubing electrically welded into one solid piece. The Peerless Gate, like the Peerless Fence, saves expense because it never needs repairs. We also make poultry, lawn and farm fences of exceptional strength. Write for free book.

THE BANWELL HOXIE WIRE FENCE CO., Ltd., Box K, Hamilton, Ont., Winnipeg, Man.

This Man is Young at 55 Years.

He is a "Health Belt Man;" therefore has the vitality and hot, red blood of youth in his veins; he towers like a giant above the ordinary difficulties of life—be a "Health Belt Man" yourself—it gives manly strength: it makes you young and keeps you young all the days of your life; it takes all the coward out of your make up—let me give you of this abundant vitality, then nothing can ever conquer you but death itself—100,000 men have taken my advice, why not you ?

The secret of life-long youth may be summoned up in one word—Vitality. If you have this great natural power in abundance years count for nothing. I use no drugs. I recommend none, Just the Health Belt. No privations, no dieting and no restrictions excepting that all dissipation must cease. Put the Health Belt on nights when you go to bed; let it send it power into your nerves, organs and blood while you are sleeping. It gives you a great flow of soft, gentle galvano-vital electricity during the entire night. One application and you are like a new being; it takes all the pain and weakness out of your back; it makes you answer the morning greeting with "I'm feeling fine." It is a great strength builder; it overcomes the results of earlier mistakes and indiscretions; gives you a compelling power, so that you are attractive to all women and men with whom you come in contact. Three months' use is sufficient. S. Coolen, Hubbards Cove, N. S., writes: "I am a man again thanks to you. Nothing can discourage me now."

This is one among tens of thousands.

Free Until Cured. Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment Send it back if it doesn't do the work. Liberal discoun for cash if you prefer to deal that way.

These Nature Cure Books FREE.

Let me send you these books. They contain much valuable health information, are fully illustrated, describe my Health Belt. Fill in coupon or send your name and address on a postal card.

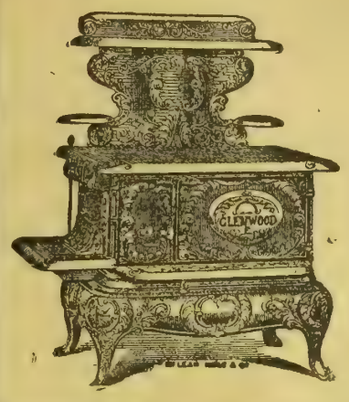
Now is the Time to Change Your Stove.



If you don't want to be putting fuel into a stove all the time, as you are doing, change your stove and you will have less trouble, make your cooking tasty, brighten your kitchen and you will have more heat to keep you warm this winter. Our Glenwood Ranges are made to save your fuel and give you heat as well, besides being a sure baker, and an improvement in your kitchen. We have them in all styles, fitted for wood or coal. When fitted for wood, you can use a 24-inch stick. We have them with tea shelf, mantle shelf, hot closet and reservoir. All our Ranges are made in St. John. No better Ranges made in Canada to-day.

Massey-Harris Cream Separator

The cleanest skimmer under all conditions—because it has greater skimming surface and because of the uniform distribution of the milk by the improved split wing.

Easy to Fill

Because of the low supply can.

Easy to Turn

Because milk is speeded up at centre of bowl, because of the easy-running ball bearings and because of the smooth running gears.

Easy to Clean

Because everything is easy to get at.

Self Balancing Bowl

Spins like a top at its own centre of gravity.

Patent Brake Attachment

Stops the bowl quickly.

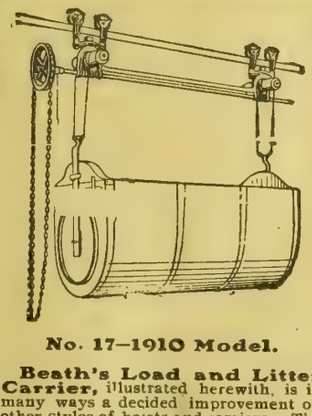
Moncton, . . N. B.



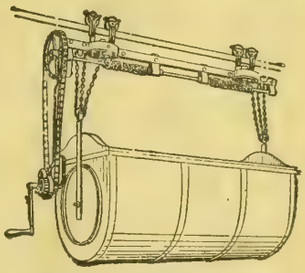
LITTER CARRIER BARGAINS

Take Your Choice.

They're Both Leaders.

AWARDED MEDAL

Toronto Exhibition, 1909.



No. 17—1910 Model.

Beath's Load and Litter Carrier, illustrated herewith, is in many ways a decided improvement on other styles of hoists and carriers. The load is raised by means of an endless chain—no dog or brake required—and the four flexible steel cables supporting the load are wound on drums protecting both ways from the spiral gear. The machine is simplicity itself and for ease of operation, strength and general utility it has no equal. All parts subject to strain are made of Malleable Iron and steel and the box is made in the most approved manner, entirely of galvanized iron. Capacity 16 Cubic feet.

Regardless of expense only the best selected materials are used in their construction, equipped with every improvement and latest 1910 Models only are offered in this sale.

The only Carriers made with all working parts of Malleable Iron and Steel carefully machined and fitted.

Our President, **W. D. Beath,** personally supervises their construction and finally inspects and tests every machine before it leaves the factory.

When you buy a **Beath Litter Carrier** at the prices we are offering them, you get a rare bargain—absolutely guaranteed—works better and lasts longer than any other Carrier on the market—has given greatest satisfaction to hundreds of delighted users and will do the same for you.

Write us for further information and sale prices on Litter Carriers, Stanchions and Steel stalls.

No. 19—1910 Model.

Plate No. 19 represents **Beath's heaviest type Feed and Litter Carrier**—a machine that will handle the heaviest loads with ease. It is built for heavy work. The wrought steel frame gives it great strength, and being fitted with triple purchase hoist and slow gear any boy can handle heavy loads quite easily.

This machine is also equipped with Beath's Patent Automatic Clutch Break, which makes the lowering of the box an extremely simple operation. The box can be stopped at any point in its descent without effort, the clutch working automatically. Box same as No. 17.

COUGH PROMPTLY STOPPED

It Lasted Just Three Days With Father Morriscy's No. 10.

ALDOUANE, N.B., DEC. 30, 1909.
FATHER MORRISCY MEDICINE CO., LTD.,
Last spring I took a severe cough, and bought a bottle of your cough cure, and within three days I was cured.

I will always keep Father Morriscy's Remedy in my home.

DOUGLAS B. RICHARDS.

A simple statement like this is the most convincing proof that Father Morriscy's No. 10 (Lung Tonic) is a most effective cure for coughs and colds.

Father Morriscy worked out the prescription most carefully, not merely to relieve the cough but to cure the inflammation in the bronchial tubes or lungs which caused the cough.

No. 10 is more than a cough cure—more even than a cure for colds, inflammation and other serious lung troubles—it is a valuable tonic which braces up the system so that colds cannot easily get a hold on you any more.

No. 10 is most helpful in Consumption, and has cured many cases.

Trial bottle, 25c. Regular size, 50c. At your dealer's or from Father Morriscy Medicine Co., Ltd., Chatham, N.B. 80

For Sale

The Nova Scotia Horticultural Show.

The annual Fruit and Vegetable Show for the Counties of Hants, Kings and Annapolis, or as it is more pretentiously styled the Nova Scotia Horticultural Exhibition was held at Windsor on the 11th to 13th October.

The show was a grand success in every particular. The Armoury made a convenient place, the weather was fine and the management all that could be desired.

Wm. O'Brien well known to the farmers of Nova Scotia was President of the Committee and filled the duties of manager in an admirable manner. The show of apples was large and of fine quality. The two weeks elapsing since the opening of the exhibition in Halifax had added materially to size, color and finish of the fruit shown. All the old campaigners were out for prize money and with them an influx of new blood, particularly from Hants County which was nearest to place of show. A number of special prizes brought out a large exhibit of barrels and boxes. These were generally well packed and well selected. Mr. F. C. Whitman's special for the best ten Northern Spys brought out some twenty-five entries making the best display of Northern Spys ever seen in the Maritime Provinces and perhaps in Canada. Mr. McNeill, Chief of the Fruit Division, said it was the best he ever saw, and he has seen them all. Plums were practically out of season, but pears and quinces made a great display. Grapes, too, were there in great quantity and really looked good enough to eat.

The vegetable show was certainly beyond praise, nothing like it was eper seen in Eastern Canada. Mangles, turnips, carrots, cucumbers, etc., certainly were wonderful and show how well adapted to root growing is our valley. A. McNeill and R. W. Starr, judged the fruit, and George B. McGill, of Middletan, the roots and vegetables.

A list of the prize winners will be published next issue.

The New Brunswick Fruit Growers' Programme.

Following is the programme of the Sixth Annual Convention and Fruit Exhibition which will be held in the Lecture Room of the Natural History Society Building, Union St., and St. Andrews Curling Rink, St. John, N. B., on October 31st to November 3rd.

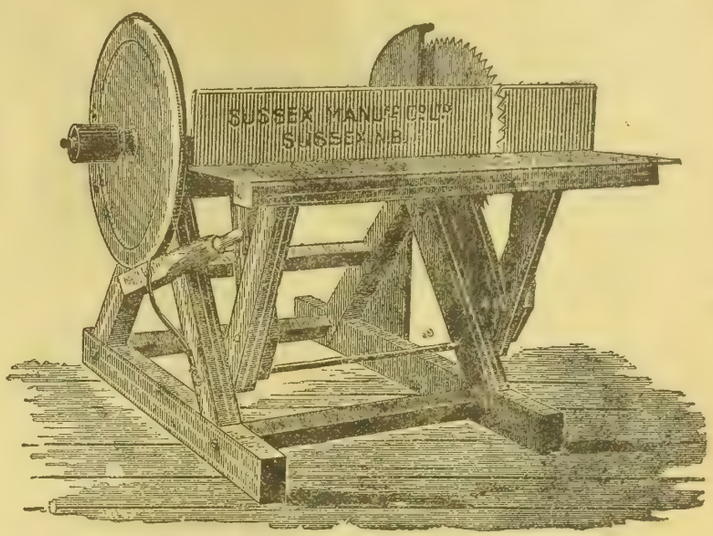
2.30 p. m.—Small Fruit Culture, Discussion led by W. T. Macoun.

4 p. m.—Question Box.

8 p. m.—

Wood Cutting Machines!



Swing Table Machine, Short.

We are offering these machines in the belief that they are the best thing of their kind on the market for the money.

We don't make this claim without reason or relization of what it means.

Our reputation is behind this Wood Cutting Machine, just the same as it is behind every other article bearing our name.

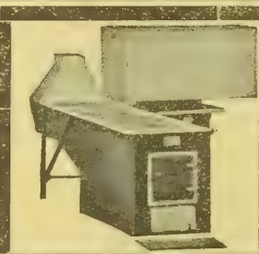
The same care and mechanical skill that has made the Sussex line of Threshers and Horse Powers the most talked about machines on the Maritime market, has been brought to bear to make this Wood Cutting Machine the best thing in its class.

We guarantee them to do more work with less power than any machine on the market. An 180 lb. balance wheel on this machine as against an 120 lb. on other makes gives a steady, even speed and takes less power.

We manufacture three kinds: Flat Table Machine, (Long); Swing Table Machine, (Long), and Swing Table Machine, (Short.)

Send for illustrated catalogue and prices.

THE SUSSEX MANUFACTURING CO., Ltd, Sussex, N. B.



PFRFECT MAPLE EVAPORATOR

A first-class maple evaporator that will make **good clear**—the kind you like—syrup, with a **very small** quantity of fuel. Price **so low** that the poorest man can buy.

Every one GUARANTEED—if not as represented **fire it back** at our expense. Sold direct to the farmer. Turns that sugar bush of yours into a paying business. Don't take our word for it. Send for our new pamphlet. It tells what the fellow who has used it thinks.

THE STEEL TROUGH & MACHINE CO,
No. 7 James St., Tweed, Ont.

The P. E. I. Poultry Show.

The Prince Edward Island Poultry Association will hold its third annual show at Charlottetown, on January 4th, 5th and 6th, 1911. Substantial prizes are offered in the various classes included in the prize list. The respective classes are open to members of the Prince Edward Island or any other regularly organized poultry association in the Maritime Provinces. Special prizes offered by the American Poultry Association are open to the world. The awards will be placed by Mr. L. G. Jarvis, Grimsby, Ontario. From past records we glean the assurance that visitors to the 1911 P. E. I. Poultry Show will not be disappointed. The P. E. I. Poultry Assaciation is doing good, work in fostering and encouraging the poultry industry and its officers and members deserve the hearty support and co-operation of the general public. The Secretary-Treasurer of the Association is Mr. Geo. Lightizer, Charlpttetown, a noted breeder of White Wyandottes. Write him for a copy of this prize list.

187-Acre Potato Farm, $6,000.

One hundred acres in machine worked fields, cuts 75 tons hay besides producing big crops potatoes for which farm is perfectly adapted, near yearly Boston boat, splendid markets and advantages, spring watered pasture for 20 cows, 62 acres heavy wood and timber, orchard of 150 trees; good set buildings, 9-room house, 100-ft. barn with basement; to settle affairs quickly $2,000 worth machinery and tools included, part cash; picture and all details of this and another that one year's income will pay for, including stock and tools, page 8, "Strout's Big Farm catalogue No. 30," copy free, Station 2612, E. A. STROUT, Kent's Hill, Me.

THREAD POWER FOR SALE.—I am offering a two-horse Moody thread power for sale cheap. No reasonable offer refused. The first set of planks are still fit for use, which shows that it has not been extensively used. Write to-day. — THREAD POWER, care MARITIME FARMER, Sussex, N. B.

Fall Work in the Poultry House.

Editor Maritime Farmer:—

At this season of the year, when poultry keepers are beginning to think about the winter accommodations for their birds, a few words on the housing and feeding problem may be of service.

supreme importance, do not imagine

Firstly: and this is a matter of that your hens require warm winter quarters, they do not! Cold has no terrors whatever for poultry if proper care is taken to have a canvas curtain in front of the roosting place so that it may be dropped and allowed to cover them in nights when the thermometer falls below zero. Fresh air is the one great object to be striven for when arranging for the wintering of the farm poultry. If your hen house has glass windows, remove them and cover in the window space with a single thickness of ordinary factory cotton such as is sold at from 5 to 8 cents per yard. Your hen house of course, faces south, and with this cotton window to break the force of any wind, a constant supply of absolutely pure fresh air will be available night and day. Your hens will be healthier and happier, and will lay as they probably never laid before during a winter in which they were housed good and warm.

"Frozen combs?" Not at all! just take a small quantity of vaseline on your fingers and rub it over comb, lobes and wattles, say once every ten days, or oftener if necessary, this will entirely obviate any danger of freezing even during the very coldest of winter nights.

Go carefully over the entire house with lime wash, taking care to get well into all cracks and corners, then give roosts and dropping board a good soaking in coal oil, again taking care to get into all crevices, etc.

Carefully clean out the floor of the house and then cover it to a depth of about 6 inches with good clean cut straw or chaff, so that when you feed hard grain morning and night, you may simply scatter it into this litter and so provide your hens with the necessity for taking the very finest of all possible poultry tonics—scratching for their feed!

Take care that the place is dry and free from all draughts. Dampness and draughts are the cause of almost all, if not all, poultry diseases. Do not fear the cold air. Dame nature has only just finished clothing your birds with a brand new suit of winter feathers, and you may safely assume that she knows what she is doing.

Having got all snug and tidy, have a cabbage and a mangel, or better still, two of each, from the roof so that they are just out of reach of the birds unless a jump is made in order to get at them, by this means you provide them with more exercise.

Do not on any account feed warm mashes in the morning or at night, hard grain at both these feeds will serve much better. In the morning it causes the birds to scratch for their breakfast and in doing so to get themselves into a healthy warmth, and at evening it does exactly the same thing with the added advantage that your birds go to the roost with crops filled with a class of food which will keep their digestive organs working and as a consequence, their blood circulating well all night long. Feed a mash to your birds one evening and at about 10 p. m., go into the hen house and feel the crops of as many as you wish, they will be empty. Feed hard grain, such as wheat, buchwheat or even corn, and then make a similar examination, you will easily feel their crops to be more than half

SEND FOR THIS BOOK BEFORE YOU BUILD ANOTHER BUILDING

Concrete is the Best Material

—from every standpoint—wherewith to build things about the farm. This recently-published book, "*What the Farmer Can Do With Concrete*," will prove to you the superiority and "in-the-long-run" economy of

"CONCRETE" as a Building Material

You, as a progressive farmer, owe it to yourself to read this book before you attempt any further improvements.

The retail price of the book is 50 cents——but we will send it, absolutely free, to any farmer who will fill out and send to us the coupon below.

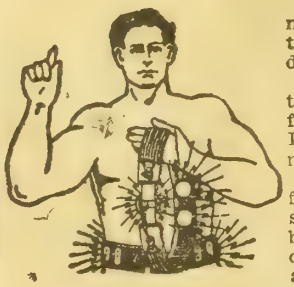
WEAK MEN THIS BELT IS FREE
UNTIL YOU ARE CURED



Take my Electric Belt for what it will do for you. Wear it while you sleep at night or while you are resting after your work. You will find it a vitalizer, a tonic to your nerves, a rejuvenator of waning vitality. Use it for any ailment which drugs have failed to cure, and you will never cease praising it.

I claim that I can cure weak men; that I can pump new life into worn-out bodies; that I can cure your pains and aches, limber up your joints and make you feel as frisky and vigorous as you ever did in your life. That's claiming a good deal, but I have got a good remedy and know it well enough to take all the risk if you will pay me when you are cured.

No man can lose on this. If the cure is worth the price, you don't have to pay for it until you get it. When you are ready to say you are a big, husky and frisky specimen of vigorous manhood; that you haven't got an ache or pain in your whole body and that you feel better than you ever did in your life. I get paid. If you can't say it after using my Belt for three months, then give me back my old Belt, and I won't ask a cent. All I ask is security while you use it.

A short time ago I took a case that I couldn't cure ,and I didn't see why, as I had cured hundreds like it. Anyway, my patient returned the Belt and said I hadn't done him any good. He said he thought I had treated him honestly, and wanted to pay me the cost of the Belt, because it couldn't be used again. I refused and told him that I had made a contract to cure him or get nothing, and I wouldn't take a dollar I hadn't earned.

Dear Sir,—I have been wearing your Belt for four weeks, and am thankful to tell you that my Indigestion is cured.
JOHN V. B. FOSTER,
Wells, N.B.

Dear Sir,—I have worn your Belt a little over a month, and can say that I know it has cured my Constipation. I sleep better ,and my stomach is better. I expect in a month or two I will be all right.
E. S. ROY, Kentville, N.S.

Dear Sir,—I am very glad to say that your Belt has completely cured me of my disease and given every satisfaction. I would not be without it for many times the cost. I will be glad to recommend it to any of my friends whom I know it would help. Wishing you every success, I am,
W. SHALES,
No. 284 Division Street, Kingston, Ont.

My Belt is easy to use; put it on when you go to bed; you feel the glowing heat from it (no sting or burn, as in old style belts), and you feel the nerves tingle with the new life flowing into them. You get up in the morning feeling like a two-year-old.

Wherever you are, I think I can give you the name of a man in your town that I have cured. Just send me your address and let me try. This is my twenty-fourth year inthe business of pumping new vim into worn-out humanity, and I've got cures in nearly every town on the map.

If you will come and see me, I will explain it to you. If you can't call, let me send you my book full of the things a man finds inspiring to strength and courage. Free if you send this ad.

Office Hours—9 a.m. to 6 p.m. Wednesday and Saturday till 8.30 p.m.

M. K McLAUGHLIN,
214 St. James St., Montreal, Can.

NEARLY MAD WITH SICK HEADACHE

There are few people who have never experienced a sick headache, and those who have not may be considered very lucky, as it is one of the most aggravating headaches a person can have. There is only one way to prevent these horrible headaches and that is, to get rid of the cause.

MILBURN'S LAXA-LIVER PILLS will do this for you.

Miss M. Denney, Edmonton, Alta., writes: "I wish to write you of your splendid remedy, Milburn's Laxa-Liver Pills as a cure for Sick Headache. I have been nearly mad with headaches for nights together, and have not been able to close my eyes. I was working at a lady's house and she told me of your Laxa-Liver Pills. I took four vials of them and I have not been troubled with a headache for about six months."

Milburn's Laxa-Liver Pills are 25c a vial or 5 vials for $1.00, at all dealers, or will be mailed direct by The T. Milburn Co., Limited, Toronto, Ont.

full of a feed which will last them until about 4 o'clock the next morning. If you must feed a mash, and this is just a matter of opinion, do so at mid-day and do it sparingly.

Keep a supply of fresh water in clean vessels constantly before the birds, "the more they drink the better they lay" is a very trite Dutch saying; also give them plenty of grit and shell or lime, and do not forget a box of ashes or dry sand for them to bathe in.

Follow these simple rules and you will soon begin to realize that "$1.50 profit per hen per year," of which you have heard so much, is no idle dream but a very beautiful probability.

To sum up: The things to be avoided are warm air, dirt, damp, draughts and idleness; those to be aimed at are fresh air, and plenty of it, the more the better; naturally induced warmth, good food, green stuff and clean water.

One word more: Keep records. Record the amount of feed-stuffs consumed daily and also the egg production, charge both at current market rates and you will find out in the most convincing way possible what a wonderfully good investment a flock of 50 pure bred hens may become.

JOHN BAYNES,
N. S. A. College, Truro.

Promise of a Record Year at the Agricultural Gollege.

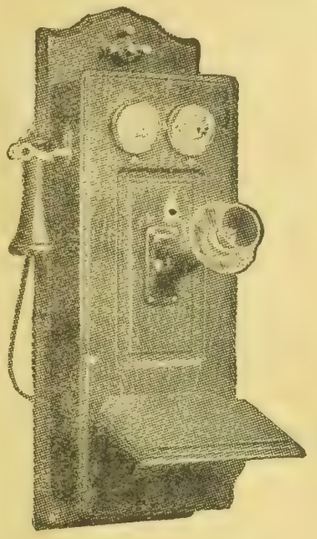
The number of applications received to date for entrance to the full course at the Agricultural College, which begins Nov. 1st, next, is just fifty, (50). At the corresponding date last year the number of applications was less than thirty, (30), and the total enrollment was forty-three (43). It will, therfore, be seen that the increasing classes at the College promise to be, at least, 50 per cent. larger than any previous year.

For the Short Courses, which begins on January 3rd next, the outlook is, if possible, even better. An application has been received for entrance to this course from one hundred (100) prospective students from Prince Edward Island alone. There will probably be fifty *50) from New Brunswick, and if Nova Scotia sends even as many as last year, there will be over two hundred (200) more.

All citizens must rejoice in the pronounced success of the Agricultural College, evidenced by the large number of students in attendance, not only on account of the institution itself, but still more because it is indicative of the new spirit of progress which is taking hold of Maritime Province agriculture.

GUARANTEED TELEPHONES.

Rural telephone systems—or any other—cannot give satisfaction unless the instruments will give perfect service, month in, month out, without needing expert attention. That is the kind of telephones we make—the kind that gives the best possible service for the longest time with least attention. Made of the best materials, by highly-skilled men, we can safely—as we do—fully guarantee them.



TRY OURS THIS WAY.

If you are using any other make of 'phone on your lines, let us send you for test two or three of ours under conditions that commit you to no outlay at all. We welcome comparison with other makes. We know ours will excel in any practical test. Write us for details of this FREE TRIAL OFFER. Ask for Bulletin No. 1.

TO NEW COMPANIES.

Our Engineers will gladly furnish you full information if you think of building a line. Write for Bulletin No. 2 and big illustrated book—"Canada and the Telephone."

SUPPLIES.

We carry in stock wire, insulators, and everything else in construction supplies. Get our prices. Prompt delivery assured.

Mrs. Bowen's Investment

(Continued from last issue.)

"I [illegible] it have happened!" Guilty Mrs. Bowen, who knew very well how it had come to pass. "Sugar and milk, Mr. Gerry? I'm very sorry, and there isn't a bit of cold bread in the house. The flour was out last night, and though we bake right away the minute it came, it's just gone into the oven."

"I s'pose I can have a cracker, then," said her mother-in-law, in unusual injured tone.

"Naw, don't say one word." And Mrs. Gerry made a great show of buttering one of the unfortunate rolls. I guess you must have got hold of one that wasn't done. I can't seem to make such biscuit as yours, no how, Mrs. Bowen; father often says to me I oughter come and take lessons; and such beautiful light cake, too, as you always have. I don't see how you manage. Do take a biscuit father. Shan't I help you to some butter, Mr. Bowen?"

Mr. Bowen by this time having distributed the steak, held forth his plate at the invitation, drew it in, tasted it, and looked very much disturbed. "Bad butter again! Well, I must say, Mr. Gerry, that it wasn't much use saving your appetite to-day. Heavy bread and strong butter!"

Here a portentous glance was aimed at the tea-tray, but missed fire. Mrs. Bowen knew it was not her fault and was determined not to take it.

"Seems to me you've lost your knack lately, 'Liza," remarked Mrs. Bowen, pertinaciously. "There ain't much variety in soda biscuit." And she took one up to crumble into her tea, with the air of a martyr. "You don't seem to eat much, Mrs. Gerry. Won't you help yourself to some of the preserves? Quinces before you, ain't they, 'Liza? Plums on the other side. Do have some greengages, to help the biscuit down."

Mr. Gerry's well-preserved appetite seemed ready to cope with all difficulties, judging from the quantity he ate; and whether it was the assistance of the plums or not, Mrs. Gerry did not fall far behind, helping herself twice to cake, and passing her cup so often that she had finished the third, before Mrs. Bowen had tasted her first. The children, who were seated afterwards at the places of their respective parents, did the repast ample justice. But, for all that, Mr. Bowen's enjoyment of the visit was entirely lost, and his wife's would have been, if there had ever been any to lose. She knew that the minute the front door had closed upon their visitors, she would be arrainged for the failure, and prepared to meet it with what amiability she could.

"Now, you know that isn't so at all, James," she said, in reply to an irritated charge of "leaving everything to Hannah," and neglecting her household generally. "You know very well that I hardly stir out of the house, even to an evening meeting. When have I been out to spend the afternoon? Not since we were at Mrs. Gerry's, and they've been here three times since."

"If it had been any one but Gerry, I should not have cared so much; but when I like a man, I like to see him at home in my hause and treated as if he was somebody. Mother, too—I don't believe she has had a thing she could eat for the last three days. She hasn't got very long to live, and it's a pity that we can't make her comfortable while she is here."

"I do my best." And Mrs. Bowen said it slowly, with a sigh, to think how little all her worry and care was appreciated after all.

"Well, I know you do, sometimes." Mr. Bowen was not insensible to his wife's patience and uniform kindness towards his mother; besides, he had relieved his mind, and the reaction was beginning to change his views of things a little. "Only sometimes it does seem fated that she shouldn't have anything she can touch. I don't see into it."

"I do; it's not having the things I need right on hand."

"Don't you have what you want, I'd like to know? Did you ever come to me for a dollar, and not get it? though I must say it seems to me its pretty much every day, about as regular as I come in to dinne."

"I don't believe you'd feel it half as much, James, if you'd get things by the quantity; and it would be twice as convenient. It takes just about half Hannah's time to run to the grocery; and when you get the things by the small quantities, they don't seem to go half as far. My father always used to get a firkin of fall butter, and a firkin of winter butter, for instance, and a barrel of flour at a time."

"Flour's seven dollars a barrel! My goodness, Eliza!"

"I guess it's more than seven dollars, getting it as we do; and what difference does it make whether you pay it all at once or a few shillings at a time? How do you do at the time about the advantage there was shop? I've heard you tell many a in having a large stock and getting the best."

"Oh, that's quite another thing; business and house keeping are two different things. I can't take money out of my business, and buy up a grocery store."

"But it all goes in the course of a year. What difference does it make? If you only knew how I hated to ask you for money! Time and time again I go without things because I hate to ask you; and then, when I come to get dinner, they are the verythings I want."

"Where are you going to keep them? I've heard you say more than once that you hadn't closet-room enough."

"I could take the small bed room in the attic, and have a lock put on the door. I could put a barrel of flour in the kitchen, you know, and there's plenty of cellar room for vegetables and such things. I know you could get them better and cheaper from the farmers."

"Dreadful convenient to mount boxes and barrels up two pair of stairs."

"But it would only be once a year, James, and then you could send one of the men over from the shop. If you only knew how much time and how many steps it would save, to say nothing of money!"

"I don't see any saving about it." And yet Mr. Bowen stood convicted by his own express declaration of the same principle to Mr. Gerry the day before, and the converstion returned rather uncomfortably to mind. 'What do you want now, s'posing you can get it?"

"Well, if we had five or six gallons of oil at once, for instance, there would not be such a bother about the lamps; and a barrel of brown sugar and half a barrel of white. Oh, I don't know. A small box of tea, you know, just what we use every day of our lives. Don't you believe you'd get a better quality for one thing? Don't you know some wholesale place in New York where you could be sure of a good article?"

Why, yes, there's Ladd & Co. Ladd is Mudford's son-in-law; they'd introduce me, I guess; but I can't spare the money, and it ain't worth while to talk any more about it."

"You spare the money when you want stock."

"Of course I do. Where would any of the bread and butter come from? I'd look pretty well running down to New York every six weeks; besides, it works up to better advantage." By which remark Mr. Bowen lost ground on his side of the argument, and the opposition was not slow to follow it up.

"Well, well, I'll think about it," was his conclusion, after another half hour of discussion; "that will do for tonight. What are you going to have for breakfast tomorrow morning—fried potatoes?"

"I don't believe we have enough in the house. Hannah couldn't bring but half a peck yesterday on account of the turnips; and they don't last us any time, the children eat so many."

Well, ham and eggs, then; it's all the same to me."

"It's too late for Hannah to go for the ham."

Anything, anything. It's a good while since you've had any corn bread, though.

"I know it is; but there's always so many things we must send for, that I neglect to send for meal."

"Get something, then; suit yourself." And with a glimmering comprehension of his wife's difficulties, Mr. Bowen betook himself to repose, and left her to puzzle it out at her leisure.

It was almost the first of January before he became a final convert to her doctrine, however; and it cost him severe self-denial to refrain from taking four shares in a foundry about to be established in Plumville, and apply the money to fill the formidable order presented by Mrs. Bowen on his trip to town.

"A saving in the end," she said, consolingly, as she placed four pocket-handkerchiefs and two pairs of clean socks in the carpet-bag she was making ready for him.

"Not much saving, I guess; I give you all you can make off this year's expenses, next Christmas; it's cost over three hundred, first and last." Which promise Mrs. Bowen did not lose sight of; and, when the time came, claimed twenty-one dollars, accardingly, and demonstrated her right to it with pencil and paper, much to her husband's amazement.

"It will just buy me a new winter bonnet and black silk dress, Mr. Bowen; and it's some time since you've had any fault to find, or mother either."

"True enough, Eliza, things do seem to go considerably smoother, and I wouldn't have thought it would have made so much difference. Mother was saying, only yesterday, that you seemed to have found your old knacks again. White sugar not out yet, and all that tea left? Well, you have managed first rate; pretty near earned it, haven't you? Not to speak of how the money would have gone smash in the foundry; completely fell through; Gerry says; I hate to lose a thing dreadfully. I'd rather spend it twice over, any time."

Mr. Bowen ceased to dwell on his own good management, for a time, and made his wife's talent for administration the theme of discourse with his particular friends, the appearance of the black silk dress in company being the signal for relating her little achievement, and to his eyes, she had not had on such a becoming one since her wedding-day.

THE END.

The Full Percentage of Cream

Getting the full percentage of cream from milk depends as much upon the oil used to lubricate the separator as upon the separator itself. Gummy oil will cut the fine bearings of your machine, spoil its balance and waste good cream in the skim-milk pail.

STANDARD
Hand Separator Oil

never gums, never rusts, never corrodes. It feeds freely into the closest bearings and insures the perfect lubrication that is essential to the free spinning of the bowl and the complete separation of cream from milk. It lessens the driving effort and lengthens the life of your separator.

One gallon cans. All dealers. Or write to

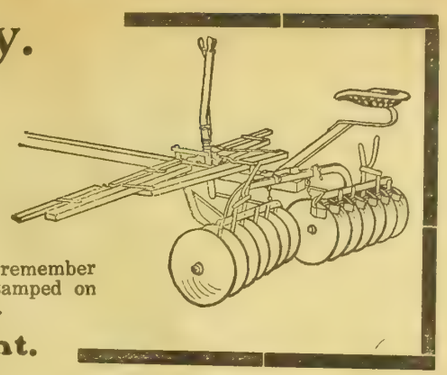
A WONDERFUL REMEDY

Orange Lily is daily curing the most obstinate cases of Female Disorders. Falling of the Womb, Leucorrhoea, Painful and Suppressed Menstruation, etc., etc., are all of them relieved from the start by its use, and a few weeks' or months' treatment accomplishes a complete cure. This remedy is a positive, scientific preparation, and is based on the discoveries of Pasteur and Lister. It is an applied treatment; that is, it is not taken internally, but is applied direct to the suffering parts, and it, therefore, acts with all the certainty of the known laws of chemical action. As it comes in direct contact with the diseased tissue, its antiseptic and nerve-food properties cannot help have a beneficent influence. I receive from 10 to 50 letters daily, speaking of the benefits and cures it is performing, and so sure am I that it will do what is claimed for it that I will send, absolutely free, a 35c box to every suffering woman who will write for it. Price, $1 per box, which is sufficient for one months' treatment. Address, MRS. FRANCES E. CURRAH, WINDSOR, ONT. 3

The "Bissell" has wonderful capacity.

Test the "Bissell" In-Throw Harrow on your land and you'll see what a harrow designed by a specialist will do. Our Mr. T. E. Bissell has been personally connected with the manufacture of disc harrows for nearly a quarter of a century and is recognized as an authority on disc harrow construction. The "Bissell" In-Throw stays right down to its work no matter how tough the land. It doesn't rock or sway. The plates stir the soil thoroughly. The gangs stay tight. There is no neck weight, therefore, the horses do more work. It has wonderful capacity—wins every field competition. The construction is simple, durable and trouble-proof. Send to Dept. M. for booklet describing both our In-Throw and Out-Throw Harrows, and our 16 plate wide cut harrows which are so popular in the North West. And remember that the name "Bissell" is stamped on every genuine "Bissell" harrow.



T. E. Bissell Co., Ltd., Elora, Ont.

Notes from the Nova Scotia Agricultural College.

The next session of the Agricultural College, Truro, N. S., will open on November 1st, 1910. The attendance at the college has been steadily growing, but it is not yet commeasurate with either the equipment of the institution or the importance of the agricultural industry in the Maritime Provinces. Have you ever thought of attending the college or, if you are a parent, have you ever thodght of sending your boy? Consider some of the advantages.

1. The college affords an agricultural education. The student will learn the constituents of soils and plants, and hence, the principles which should guide him in his farm practice, the constituents of manures and fertilizers and how to mix and apply these intelligently, the use of farm machinery, how to judge, select, care for, and make profitable all kinds of farm stock, the treatment of animals in disease and how to perform veterinary operations, the principles and practice of fruit growing, dairying, poultry, carpentry, blacksmithing, etc.

2. In addition, students will study English, arithmetic, book keeping, and such subject as are taken up in the geoeral High School and College courses.

3.—No tuition is charged. Board will average $3.50 per week, for 22 weevs. Books $10.00 to $15.00. These, with railway fare, are all the necessary expenses. Any industrious student can earn on the farm from $15.00 to $50.00 during the term. We do not know of any institution in Canada where an education can be obtained at less cost.

4.—The term is from November 1st to April 15th, the least busy season of the year.

5.—Most of the students return to their farms. A few go on and prepare themselves for professional work. Thase who have graduated from the Nova Scotia Agricultural College and studied at Guelph and other institutions have, almost invariably, stood at the top of their classes and are unanimois in stating the advantages of a course at the N. S. A. C.

6.—Agriculture is much more remunerative than formerly, but competition is becoming all the keener. The 20th Century farmer, if he is to succeed, cannot afford to be without a better education along agricultural lines than his father had. Surely the boy who will devote his life to agriculture can be afforded from the farm during the two short winter terms, during which to acquire a better knowledge of his life's profession so that, as a citizen, he can hold his own with men of other professions.

7.—The College is equally free and available to students from all the Maritime Provinces, as well as to those from abroad who purpose settling in these provinces.

Send a letter or post card to the undersigned and get fuller information in regard to the courses.

Signed

M. CUMMINGS,
Principal Agricultural College.

P. S.—If you are not interested in the foregoing statements, send this to someone whom you think is or should be.

A Windsor Lady's Appeal.

To All Women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Painfull or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write to-day. Address Mrs. M. Summers, Box H 309, Windsor, Ont.

MARKETS.

St. John Prices.

GRAIN—Oats, 43c to 45c.

LIVE STOCK—Milch cows, $35.00 to $60 00

DRESSED MEATS—Beef(carcass) 5½c to 8½c beef (retail) 10c to 22c; mutton, 5c to 7c; veal, 7c to 10c; lamb, 8c to 10c; pork, 9c to 9½c.

DAIRY PRODUCTS—Creamery butter, 25c to 26c, dairy butter, 20c to 25c; cheese, 13½c to 14c;

POULTRY AND THEIR PRODUCTS—Eggs, 25c to 30; fowl 40c to 80c: chickens 50c to $1.10; ducks, 70c to $1 50; turkeys, 20 to 24c.

VEGETABLES—Carrots, $1 00 to $1 50; potatoes, $1.20 to $1.40; turnips, 40c to 60c; beets, $1 50

MISCELLANEOUS—Beef hides, 9c; calf skins, 15c; sheep skins, 50c; lamb skins, 50c to 60c.

Charlottetown Prices.

GRAIN—Oats, White, 34c, black 37c.

FEED STUFFS—Retail, bran, $1.25; shorts, $1 40; middlings, $1 50; oil-cake $2.30; corn meal, $1.80 to $1.90.

FRUIT—Apples, $2.00 to $400.

VEGETABLES—Potatoes, 30c to 35c; carrots, 30c to 35c; turnips, 12c to 15c; beets, 35c to 40c

MISCELLANEOUS—Hay $8.00 $8 50; straw; $5.00 to $6 00; beef hides, 8½c; calf skins, 12c, lamb skins, 30c to 50c.

Trade is qeiet, but considerable produce is being disposed of. Quite a few schooners are looking for cargoes and the short crop of potatoes is tending to make business in that line quiet as the schooners wanting to buy do not care to close with a fair quantity of potatoes and shippers are not willing to guarantee money as farmers have an idea that the short crop will cause higher prices later on, but we think that prices are quite high enough and that they are not likely to go much higher even though the quantity marketed is small. Pork is offering freely and price is ½c lower. Butter is quiet, not much change in price, but the feeling in the market is easy. Eggs are high and supply is limited, except storage eggs which are plentiful yet, but are of course all in the hands of one or two large dealers. Cheese reached the highest price of the season on last board when 11 3-16c was paid. Quite a lot of hay is going to Boston by plant line boats and while they continue running the price is not likely to become much lower. Shippers report that there is no money shipping to England at present prices. There is quite a brisk demand for lambs and a large number are being killed and stored at the cold storage plant.

STOCK NOTES.

HOUDANS AND DORKINGS.—I am offering choice Dorking and Houdan Cockerels for sale at $1 25 each. Could also spare a few Dorking pullets or yearling hens at $1.50 each, Satisfaction guaranteed. Send your order to-day, as they are going fast.—W. J. M. MACLEOD, Loch Lomond West N. S.

IMPORTED CLYDESDALES FOR NEW BRUNSWICK —Mr. Archie Fraser, of Donald Fraser & Sons, lumberman recently visited Scotland and purchased three Clydesdale mares which are now at Plaster Rock. They are said to be the finest ever imported into this province. It is the intention of Messrs Fraser to go extensively into the breeding of high grade Clydesdale stock.

THE PRIDE OF THE HERD—Lady Rose Akrum, a purebred Holstein cow, bred and owned by C. H Giles, Brooklands Holstein Farm, Fredericton, N. B., dropped a heifer calf on October 3rd, which tipped the scales at 108 pounds a few hours after it was born. The calf is a very strong one and was on its feet 20 minutes after birth. It is highly prized at Brooklands as its dam is one of the very best. She took second place at Fredericton last year in a class of 8 fine cows The calf is sired by Ormsby Veeman, a very high class bull.

PIG TROUBLES—J C. G., P. E. I. I lost three pigs last year and one this year. They were all seemingly affected with the same disease. I kept my pigs last year in a pen and this year in a clover pasture They were fed raw potatoes. skim milk from the cheese factory and swill. After they died black spots appeared on their bellies and on their ears. Can you tell me what the trouble is and perscribe treatment.

ANS —The meager discriptions given do not furnish enough information to diagnose the disease. An examination of the pigs while sick or a post mortem examination might reveal the trouble. Probably the trouble was caused by the feed and confinement last year and the feed this year. I would advise supplementing the feed with a small quantity of grain twice a day, and paying particular attention to see that the swill is fresh and does not contain anything that is injurious such as soap or excess of salt. I would think that some irritant in the feed was the cause of this years trouble. If any other patrons of the cheese factory had had similar troubles look into the skim milk supply for a cause. J. STANDISH, V. S.

NOVA SCOTIA BUYS GOOD STOCK—A splendid acquisition has recently been made by the Government of Nova Scotia, in the purchase of the well known Clydesdale stallion Royal Baron. For several years this horse has been making history, not only in the locality of Beaverton, where he has stood for service at the stand of Messrs. Hodgkinson & Tisdale ever since he crossed the Atlantic with that memorable importation which Messrs. Graham Bros, made to exhibit at the St. Louis Exposition, Chicago International, and at leading shows in Canada, Royal Baron, King's Crest, Baron Sterling Moncrieffe Baronet were a galaxy of Clydesdales which made 1905 a memoral year with the Clydesdale men. Out of the importation, Baron Sterling and Moncrieffe Baronet are both dead, but the other two have made good. King's Crest stands for service at Portage La Prairie and his gets are winning in the strongest kind of Canadian bred company. Royal Baron has proven himself to be an outstanding sire, and not only this, but the sire of others, equally notable as getters with himself. Few, if any, horses are coming to the front as sires of high merit in such a way as is Celtic Baron, his son, now standing for service at Brantford. Ont. Royal Baron is a big, massive horse, as flashy and sound as a three-year-old, and his record as a sire of showring winners is steadily lengthening. Every year sees a fresh lot of his gets to the front at leading exhibitions. He is a son of Baron's Pride, while his dam is by the well known stallion Mount Royal, a sire of other great producers in the old land. Prof. Cumming who made the purchase, is to be congratulated on acquiring this horse to head his stud in Truro, N. S.

Another purchase of note was a Holstein bull from James Rettie, Norwich, Ont. This bull has for dam the grand champion Holstein female at the Canadian National this year, and is a full brother to the junior champion female, both owned and exhibited this year by Mr. Rettie. Purchases of some of the prize winning hogs at this year's Canadian National were also made. A nice bunch of Berkshires were secured from Thos. Teasdale, Concord, and a fine lot of Yorkshires, all breeding stock, from D. C. Flatt & Son, Millgrove, Ont. The purchases were made by Principal Cumming, of the Truro Agricultural College, who had associated with him, in making the selections, E. S Archibald, of that Institution. This stock will be added to the College herds, where they will be kept for the benefit of the farmers of Nova Scotia

50 Acres Near Augusta.

Just out from all advantages, 15 acres in fields, pasture for 10 cows; watered with spring fed brook, 300 cds. wood, some timber, orchard 50 trees; pretty cottage house, 40 ft. barn, large poultry house, pleasant view; if taken at once, family cow, poultry, 2 hogs, hay, etc., included for ooly $1,500, part cash; for all details, traveling instructions for this and other, see page 3, Station 2612, "Strout's Biggest Farm Bargains," copy free. CUMMER DOWSWELL Limited
HAMILTON - ONT.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad, as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

No experience needed. The largest advertised goods in Canada. Write at once for particulars.—W. A. JENKINS MFG., CO., London, Ont.

WALTER E. EATON, UPPER CANARD, N. S., writes:—"During the last twelve months I have sold ten young Shorthorn bulls to Agricultural Societies. I have yet to hear the first complaint in reference to any one of the ten. One society favored me with their second order and another came back and bought the third bull that they have received from me, which goes to show that they have been perfectly satisfied with their previous transactions with me I still have some bulls that are superior to any I have previously owned.

CLYDESDALE SALE.—On another page of this issue will be found the advertisement of the Ormsby Grange Stock Farm's Clydesdale sale, Duncan McEachran F. R. C. V. S., D. V. S., the proprietor of Ormsby Grange Stock Farm, has had a long and successful career in breeding and importing high-class pure-bred Clydesdales. His present offering contains fillies of extra size, heavy bone and of the very best breeding. They are by such noted sires as Lord Derwent, Barron's Best, Heather Sprig, Pride of the Lothians, etc., and have been specially selected for the improvement of Clydes in Quebec and the Maritime Provinces Breeders will find in this sale a rare opportunity to buy individuals that will give the horse-raising industry in the Maritime Provinces an uplift that will be felt for years to come.

ANDREW MCPHERSON, ROCKLIN, PICTOU CO., N. S., writes:—"In calling the attention of the readers of the MARITIME FARMER to my advertisement, which appears in this issue, I would say that this season's crop of lambs averaged 125 per cent, and although they are young, as they were not dropped until late in April and the first week in May, they are of fair size and growing. They are of the low down, thick set, well covered type, that all lovers of Shropshires like to see. These lambs are sired by "Factotem," bred by Mr. John Campbell, Ontario, and was a first prize winner, as a lamb, at the fall shows, in that province. Mr. Campbell describes him as "one of the best he ever shipped." After serving two seasons in the Meapow Brook flock, he was sold to Mr. Vernon Shaw, Montague, P. E. I., who was well pleased with him. His lambs are like him, strong boned, robust fellows and not being fitted for the show ring, they are in a condition to do lots of work. Some of the Meadow Brook ewes were bred to an exceptionally strong, young ram, bred by John Miller, Brougham, Ont., and imported by the Rocklin Agricultural Society. We are, therefore, in a position to supply lambs of both sexes, not akin, and at prices that puts them within the reach of everyone. We can also spare a few young Ayrshire cows, due to calf in fall and early winter. Correspondence solicited."

DISPERSION SALE OF AYRSHIRES AT HAMPTON.—Your attention is directed to the advertisement, in this issue, of the Ayrshire stock to be offered for sale at auction at the Hampton Stock Farm on Thursday, Nov 10th. As this company finds it impossible to make satisfactory arrangements immediately to re-lease its present equipment, and in order to dissolve the partnership, they have decided to offer the entire stock of pure-bred Ayrshires to the highest bidder, without reserve. There are many good individuals in this lot and as a record of production has been consistently kept, and this production produced on the ordinary every day feed, such as in effect on every New Brunswick farm, one can see just exactly what they can expect from the mature cows on the ordinary feed The five three year-olds, either just in or due to freshen, are a nice even lot, several of them were the choice of the judge at St. John, Sussex and Halifax as yearlings and they should make productive cows Many of these animals, if forced for production, would do much more than is shown by the records. One or two of the young things have been bred to Conqueror, the herd bull, in Mr E. A. Schofield's stock. This bull is bred from a record of performance cow, giving 335 pounds butter fat, as a three-year-old, and his grand sire was champion at St. Louis. They should produce something good. This is a genuine offering, as all will be sold at some price and bargains may be expected Hampton is very conveniently reached and the farm is quite close to the station.

AUCTION SALE OF REGISTERED SHEEP— Auction sales of registered sheep will be held at Fredericton: on Tuesday, October 25th, at 10 a. m. Newcastle on Thursday, October 27th, at 1 p. m. Moncton, on Saturday, October 29th, at 11 a m. Mr. A. H. Thompson will offer for sale, without reserve, at above places on dates mentioned, sheep personally selected from flocks of leading Canadian importers and breeders, of following named breeds; Shropshires, 10 rams and 6 ewes; Hampshires, 12 rams and 12 ewes, Oxford Downs, 10 rams and 6 ewes, South Downs, 5 rams; Leicesters, 11 rams and 6 ewes, Cotswolds, 12 rams, Lincolns, 12 rams. These offerings will be of best breed, type and individual excellency, and offer to Agricultural Societies and individual breeders excellent opportunities for infusing the best strains in their flocks. Terms: 5 per cent. discount for cash at sale. Approved joint notes for four months with 6 per cent. interest will be accepted. The different breeds mentioned will be divided between the three places. These sheep will be put up and sold for what they will bring, as the Department has arranged to bear any loss. All these offerings have been carefully selected from the best Ontario flocks and we can recommend the stock to intending purchasers. Agricultural Societies are invited to send representatives to the sale most convenient for them to attend. It is not possible to make arrangements for special reduced rates on the railways, but any party of ten starting from one station can get single fare for the return trip on the C. P. R. If it is inconvient or impossible for a Society to be represented, any orders sent to the Department will be filled as far as possible. The breeders contributing to the sale are; Telfer Bros., Paris; A. W. Smith M. P., Mable Grove; John Smith, Beachville; Norman Price, Norwich; Patrick Brothers, Ilderton and Harmer and Hodgson, Brantford.

COVENHOVEN STOCK FARM,

ST. ANDREWS, - NEW BRUNSWICK.

We have several choice young French Canadian Bulls for sale, at very reasonable prices; also an excellent lot of young Tamworth Sows. Visitors are most welcome.

J. R. OSTLER, - - - - Superintendent.

FREE ! FREE ! !

I have two Jersey bull calves, registered, two and six months old. Both highly bred. The granddam of the younger bull has won two firsts in the milk test at the Charlottetown Exhibition. The other bull is also bred from good milking strain. To the first person ordering either of these bulls, I will send free a B. P. Rock cockerel, bred from Maritime champion stock. Now is your chance; act quick. Other cockerels, same stock for sale.—WM. CLARK, North Wiltshire, P. E. I.

Ayrshire Bull For Sale.

Togo of Spring Brook farm 24911, Sire Barcheskie Admiral Togo, 19648, Dam Emma of Nether Craig 11077. I want to sell or exchange before January 1st, 1911. Write for further particulars,

HAROLD FALCONER.
Alma, N. S.

Spring Brook Farm Ayrshires.

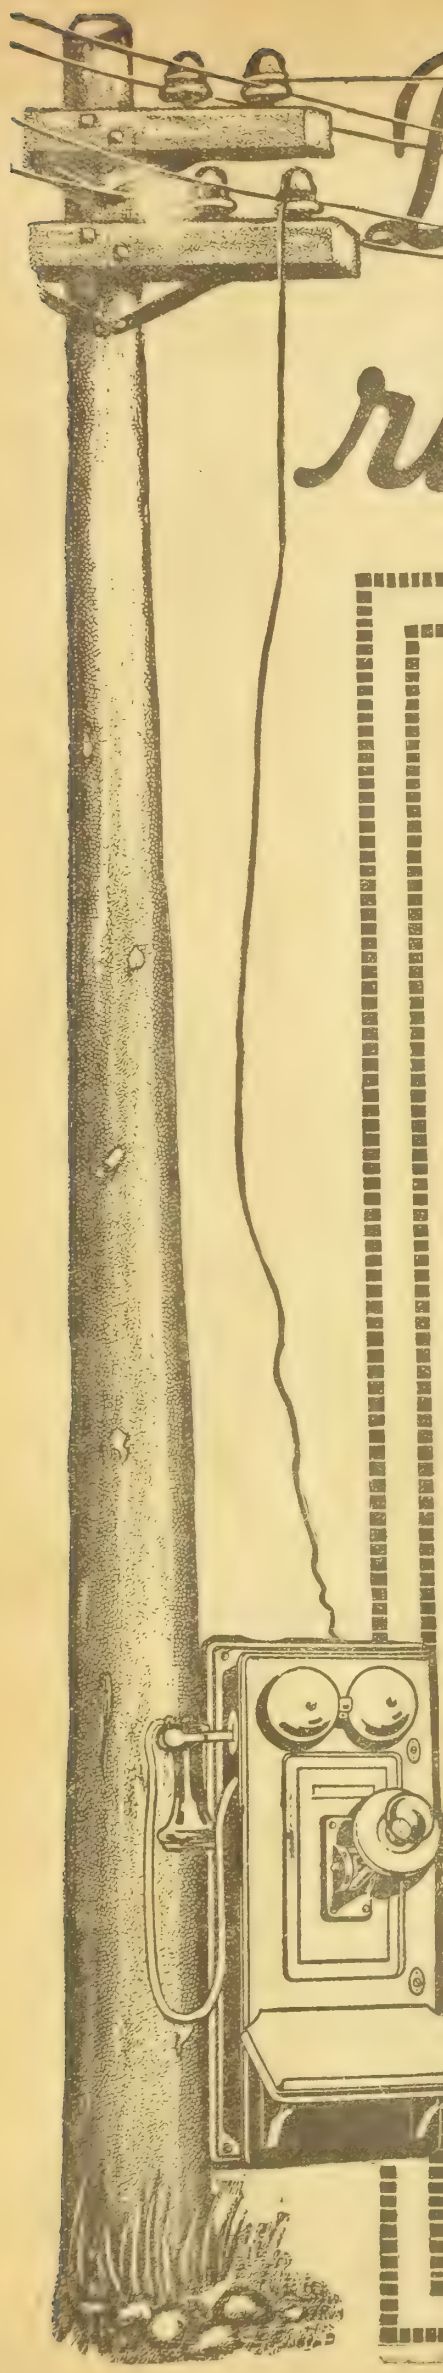
This herd won 1st, 2nd, 3rd in the aged cow class at the Maritime Winter Fair Dairy Test Amherst, 1909. 2nd, 3rd, 4th in the three-year-olds, also 2nd, 3rd, 4th, in 2-year-olds. We have some bull calves to offer, also females all ages.

McIntyre Bros., Sussex, N. B.

Sunnyside Stock Farm.

Three Ayrshire bull calves, females any age. Guernsey females, any age. Two sows to farrow in June. Intending purchasers met at railway depot. Telephone in residence.

J. FRANK ROACH,
Sussex, N. B.



Does the magic wire run to your place?

ARE you connected with the markets—with your friends—with the outside world—by telephone? Or is there no telephone system in your community? There has been a marvellous growth of the telephone in the rural districts of Canada **during the past two years.** The telephone problem may be of interest to the city man, but it is of even more interest to the man who lives in the comparative isolation of the rural districts. We believe the only reason why **you** have not a community-owned system in your own locality is on account of your not being in a position to secure sufficient data on the subject of organization and construction.

FARMERS!

THERE is no further need of your not knowing how to proceed with the organization and construction of a rural telephone system of your own, because if you will simply write for our Bulletin, the whole story is there, a plain and simple story of how to start a community-owned telephone system going and how to keep it going. Hundreds of such companies are now doing business throughout the Dominion, and it is only a question of your having the essential facts down in detail to enable you to secure the interest and support of your neighbors and to organize a company of your own.

THE FARMER'S PHONE

The No. 1317 type telephone set, specially adapted for Rural Telephone work, is of the very latest design and is the most powerful and efficient set on the market to-day. It is the very acme of telephone construction. Because we make the best telephone specially adapted to rural use, over 90% of the rural telephones used in Canada to-day come from our factory. The president of the largest telephone company in the world could not have a more perfect instrument for his own private use. The details of this set are clearly set forth in the Bulletin mentioned above.

This Book Is FREE For The Asking.

All you have to do is to ask for Bulletin No. 140 and we will mail you **free** the whole story of how to organize and construct Rural Telephone lines. Do not hesitate to ask if you want the book — a postal card will bring it.

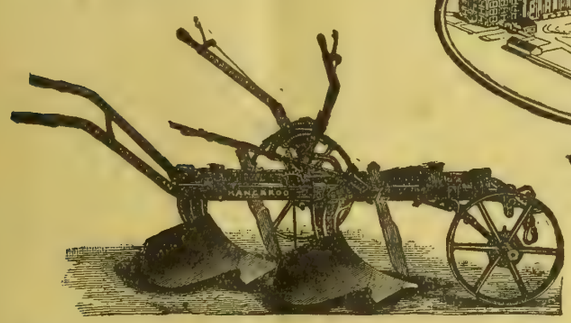
Plow Two Furrows, Not One--Work Three Horses, Not Four--Pay One Man, Not Two.

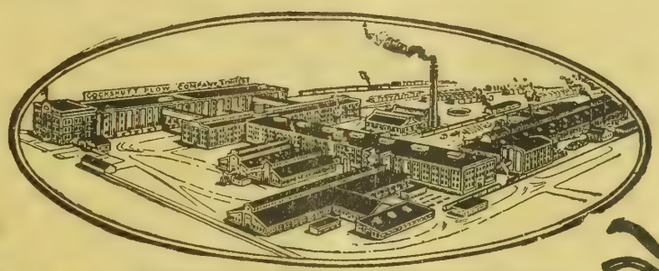
That's the Way to Make Your Farm Pay Big Profits.

Kid Kangaroo



WE have sold many thousands of these plows and we have yet to hear of a single complaint from any buyer.

The Kid Kangaroo is fitted with our new patent straightener device which is very convenient for controlling the plow. It is fitted with special soft-centre crucible steel moldboards that will clean in any soil. Frames can be adjusted for wide or narrow furrows. We can furnish either wide or narrow bottoms, rolling colters, jointer or knife colters as desired. Three horses can easily draw this plow in the heaviest land.

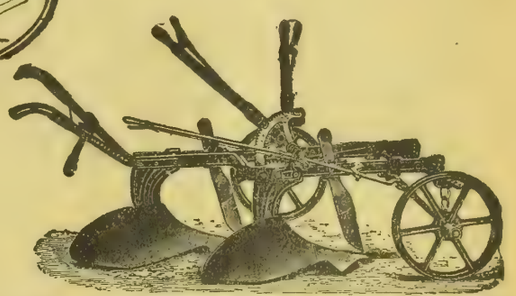


Where Cockshutt Plows are made

FARM RIGHT.

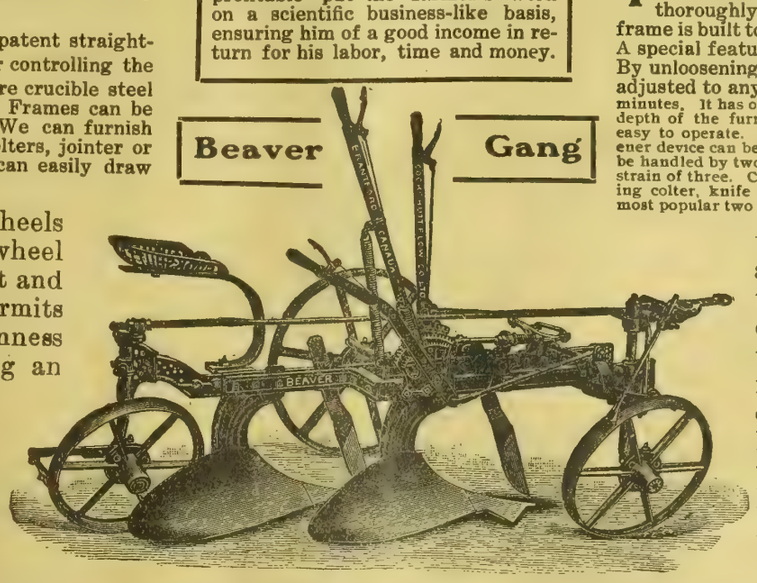
NO farmer should be without a Cockshutt Catalogue. It describes and illustrates a larga range of implements which have revolutionized farming—made it profitable—put the farmer's work on a scientific business-like basis, ensuring him of a good income in return for his labor, time and money.

Maple Leaf



THIS plow combines great strength, durability and remarkable light draft. It has been carefully and thoroughly tested, and will do perfect work. The frame is built to combine strength with the least weight. A special feature of this plow is the adjustable frame. By unloosening two bolts and two set-screws, it can be adjusted to any width from 7 to 10 inches, within a few minutes. It has our new fine adjustment ratchets for gauging the depth of the furrows. Levers are conveniently placed and are easy to operate. The wheels are absolutely dustproof—straightener device can be fitted to plow when called for. This plow can be handled by two horses, yet is quite strong enough to stand the strain of three. Can be fitted with wide or narrow bottoms, rolling colter, knife colter or jointer. This is, without doubt, the most popular two furrow plow manufactured.

Beaver **Gang**



NOTE the position of the wheels of this plow. The front wheel is fitted with spring attachment and not being directly opposite, permits the plow following the unevenness of the ground and yet keeping an even depth of furrow. The levers, being to the right of the operator, enable him to easily adjust the plow to the necessary depth and width of furrow, thereby insuring good work. Can be fitted with wide or narrow bottoms suitable to the soil—also rolling tcolers, knife colters or jointers. It is also shipped with three horse trees. tongue and neck yoke. We cannot recommend this plow too strongly to farmers who want good work done quickly and cheaply. The great demand we have for the Beaver Gang is proof of its efficiency.

You can get a Cockshutt Catalogue free by simply writing for it on a postcard.

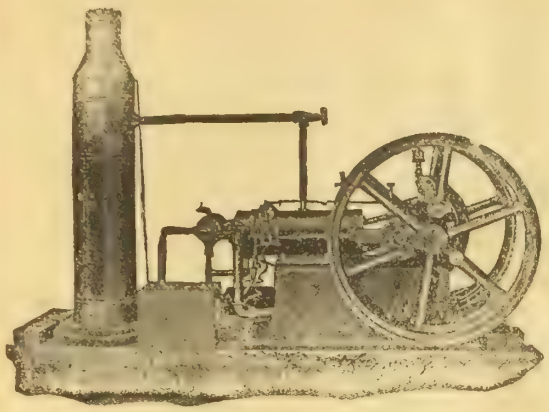
Farmers of Quality



Stationary and Mounted, in 1 1-2 to 30 Horse Power.

Want Quality !

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the **"Ideal"** is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of sealing directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinder head, so that when the valves become worn, the valve cage and valve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn, you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer

"Ideal" Gas and Gasoline Engines are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price.

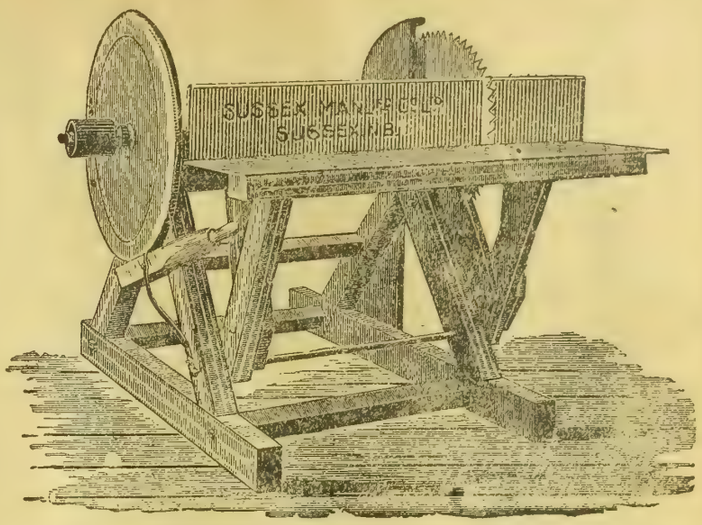
Wood Cutting Machines !



Swing Table Machine, Short.

We are offering these machines in the belief that they are the best thing of their kind on the market for the money.
We don't make this claim without reason or relization of what it means.
Our reputation is behind this Wood Cutting Machine, just the same as it is behind every other article bearing our name.
The same care and mechanical skill that has made the Sussex line of Threshers and Horse Powers the most talked about machines on the Maritime market, has been brought to bear to make this Wood Cutting Machine the best thing in its class.
We guarantee them to do more work with less power than any machine on the market. An 180 lb. balance wheel on this machine as against an 120 lb. on other makes gives a steady, even speed and takes less power.
We manufacture three kinds : Flat Table Machine, (Long); Swing Table Machine, (Long), and Swing Table Machine, (Short.)
Send for illustrated catalogue and prices.

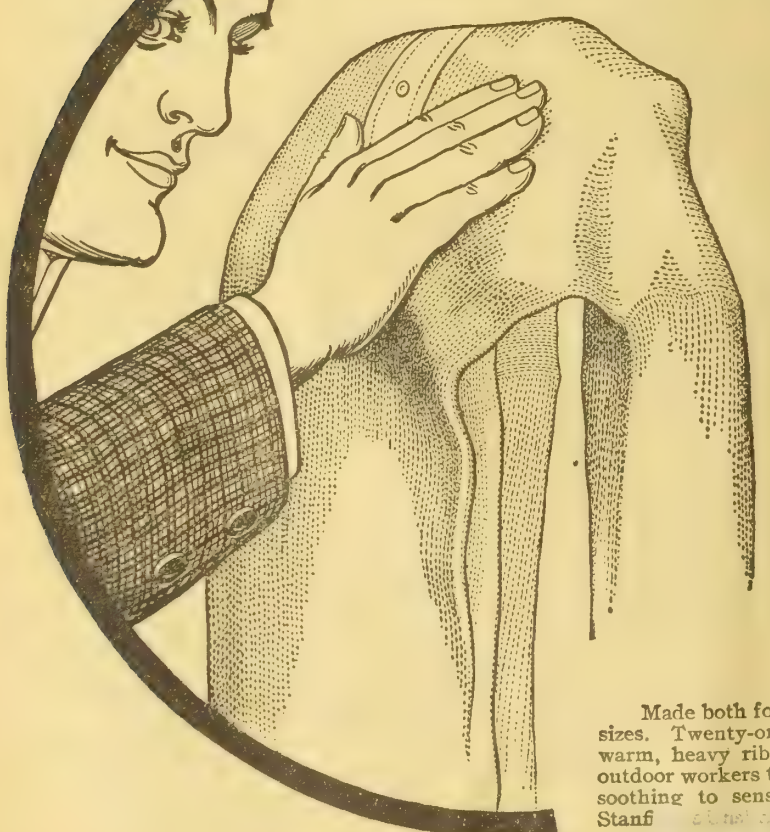
Before the wool is spun into yarn for Stanfield's Unshrinkable Underwear it is washed, scoured, picked and combed repeatedly, until it is so clean that even you would say "good enough". But our critical system knows no "good enough" short of extreme perfection. For again when the garments are knit they must undergo another series of vigorous washings. Then they are *double processed*—an exclusive improvement of our own; rendering every garment beautifully clean and sanitary. Finally, a rinsing in distilled water—water pure enough to drink—perfects a most grateful softness.



Soft, grateful - even to the most tender skin

STANFIELD'S Unshrinkable UNDERWEAR

Made both for women and for men in perfectly fitting sizes. Twenty-one different weights and qualities: from warm, heavy ribbed garments particularly suitable for outdoor workers to the soft, finely knitted underwear so soothing to sensitive skins. Your local dealer sells Stanfi[illegible]ble Underwear. Catalog on request.

AND

CO-OPERATIVE DAIRYMAN.

Official Organ of The Farmers' and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association, The Nova Scotia, New Brunswick and P. E. Island Fruit Growers' Associations, The Maritime Stock Breeders' Association and The Maritime Bee-Keepers' Association.

Volume 16. Sussex, N. B., November 8, 1910. Number 3.

The Big New Brunswick Fruit Show

Fruit Growers' 6th Annual Convention

THE Sixth Annual Convention of the New Brunswick Fruit Growers' Association and the first extensive fruit show held by New Brunswick growers were held in St. Andrews Rink, St. John, N. B., on October 31st to November 3rd, inclusive.

The other annual meetings of the association had been held at Fredericton, in mid winter, usually on the dates following the Farmers' and Dairymen's Convention, and, on these dates they showed small quantities of the fruits of their labors, in their respective orchards, during the preceding seasons. These fruit shows gave ample indications of the fact that, where intelligently handled, fruit trees would do as well in New Brunswick as in any of the more famed apple growing countries—indeed, it was found that certain varieties were grown to a perfection in New Brunswick that could not be excelled by any other country either in size, color or flavor.

Encouraged by the good showing made at the smaller shows, and, in response to popular demand, the government of the Province, in the fall of 1909, appointed Mr. A. G. Turney, a young, energetic man, of wide experience, to the position of Provincial Horticulturist. Mr. Turney went at his work with considerable energy and by timely words of advice and demonstrations of practical methods he has so enthused the fruit growers, with whom he has come in contact, as he travels through the length and breadth of the province, that new life has been added to their former enthusiasm to such an extent that it has become contagious and every one realizes the importance of a natural resource that has for so long a time, been either dormant or very carelessly handled on many farms.

At the annual convention held in Fredericton last winter, Mr. Turney was appointed secretary of the Fruit Growers' Association, and in that capacity he has been instrumental in more than doubling the membership list.

It was conceded by all concerned that a fruit show held in mid-winter did not give the fruit growers of the province a proper chance to show fruit to the best advantage, as many of the best fruit growing sections are badly handicapped in regard to transportation facilities, during the winter season, and, furthermore, many of the most popular varieties are past their bloom for show purposes, at so late a date. Consequently, it was decided, at last winter's meeting that a big fruit show be held in St. John early in November, so that the river counties, whose transportation facilities in mid-winter are not what they might be, would have a chance to send their fruit, and their men too, and where a larger number of New Brunswick's population and of strangers within her gates would see, to better advantage the fruit growing possibilities of the province, and thus advertise New Brunswick's fruit and fruit lands.

The Sweepstakes Dairy Herd at the Halifax Exhibition.

Winners of the silver tea service, denoted by M. S. Brown & Co., Jewellers, Halifax, N. S., for the best herd, any breed, consisting of one bull, two aged cows, two three-year-old cows, two two-year-old heifers and two yearling heifers. The above Ayrshire herd, owned by M. H. Parlee, Lower Millstream, N. B., captured the coveted trophy in competition with another Ayrshire herd, two Jersey herds, one Guernsey herd and one Holstein herd.

Mary Rooker II An Ideal Holstein Cow

A prize winner at Maritime shows, Sweepstakes Holstein female at Halifax exhibition and first in her class at both Charlottetown and Halifax. Owned by W. M. Lea, Victoria, P. E. I. See stock notes.

THE FRUIT SHOW which was held in St. Andrews Rink was a highly representative one. As one entered the building he beheld an artistic display of five specimens of the various varieties of apples grown in the province making a total of upwards of eight hundred and fifty plates.

Along the side of the building were two large signs bearing the following inscription: "New Brunswick Apples exhibited by the Department of Agriculture, grown by Randall Bros., J. W. Clark, J. C. Gilman & Son, W. P. Fox, W. Staples, G. C. Cossar, A. R. Gorhan, R. E. Flewwelling and Benj. Charters." Under which were arranged in double tiers no fewer than three hundred and sixty boxes of number one fruit which had been packed at the New Brunswick Cold Storage Warerooms, St. John, for the department, from fruit supplied by the above mentioned orchardists, by Mr. A. C. Parker, of Berwick, N. S., who has had a wide experience in the packing of fruit in boxes, both in Nova Scotia and on the Pacific Coast. His demonstrations of the various methods employed in box packing were carefully followed by an enthusiastic audience that found his discourse both interesting and instructive. The boxes exhibited by the Department are to be shipped at once to the English markets and as each apple is wrapped in tissue paper bearing the following announcement for the province:—

"NEW BRUNSWICK, THE LAND OF COMFORTABLE HOMES.

has nearly 18 million acres within one week's journey from Great Britain.

At least 14 million acres are known to be capable of economically producing all the crops and fruits native to the Temperate Zones, and and as yet less than 2 million have been developed.

Though admirably advertised attractions of Western Canada, New Brunswick has advantages, peculiarly its own, of such intrinsic merit that prudent investors and intending settlers cannot afford to pass them by. It offers to settlers agricultural and fruit lands upon terms nowhere equalled; to investors, mineral and forest resources and manufacturing openings. Its water powers, natural gas, and abundant and easily-mined coal mean economical power and transportation; while its maritime location means cheapest and most expeditious export and import facilities. Its commercial centre—St. John—is the

ment which will be a good advertisement for the province:—

Part of The Dominion Department's Exhibit
At the Big New Brunswick Fruit Show.

winter port of Canada, putting the Province upon the great highway between Europe and Canada and the Far East.

Every portion of the Province is well watered, the climate equable and healthful. Crop failures are unknown. The yearly sunshine record is the largest af all provinces but one. The soil produces abundant fodder, crops, grains, vegetables and fruits of the highest quality. A law-abiding population, good roads, good schools, honest and progressive provincial and municipal administration, with low taxation, make it a most desirable home land.

The agricultural laborer, domestic help, the farmer with small capital, the gentleman who wishes to make his income do more for him than at home, and the man of wealth—all can find splendid opportunities.

Farms of 100 acres or more, with buildings and improvements, can be bought this spring at from £100 upwards, and frequently on easy terms; but homeseekers are returning to the Province, and values are increasing. Crown Lands may be bought at $1.00 per acre to the extent of 100 acres for each male settler.

Water-powers are being developed, new railroads are building, practically inexhaustible coal, iron mines are being opened up, immense areas of oil shales are to be worked for oil and other products. The Province generally is moving and entering upon an era of great progress and wealth development. Now is the time to come to New Brunswick to invest either labor or money.

For all information inquire at The New Brunswick Offices, 37 Southampton Street, Strand, London, W. C.; or write A. Bowder, N. B. Representative at that address; or send to A. B. Wilmot, Supt. of Immigration, St. John, New Brunswick, Canada.

The boxes packed by the fruit growers themselves for competition in the export and domestic classes numbered close to the ninty mark. Barrels packed for domestic and export purposes and for competition for special prizes numbered about sixty. Mr. C. H. Vroom gave an interesting talk and a demonstration in the barrel packing of fruit which were eagerly listened to and keenly watched by the audience.

In the centre of the building a diamond shaped stand groaned under the weight of about two hundred bottles and jars of preserved fruits, jams, jellies and marmalade of various kinds.

A very conspicuous exhibit was that mad by the Dominion Department of Agriculture which contained four boxes each of New Brunswick, Nova Scotia, Ontario and British Columbia fruit and two boxes from the famous and much boomed Hood River Valley, Oregon. These boxes were for contrast purposes and we cound not see that the New Brunswick was a whit behind that from the other provinces, indeed, if anything, we would say New Brunswick led the way. The New Brunswick boxes contained Ben Davis, Dudley, Fameuse and Bethel varieties. Nova Scotia had Northern Spy, Gravenstein, King and Blenheim Pippins. Ontario showed Northern Spy, McIntosh Red, Ben Davis and American Baldwins. British Columbia showed the same varieties as were shown by Ontario. The boxes from Hood River Valley contained Newton Pippins and Spitzenburgs.

The various exhibits were judged by Messrs. G. H. Vroom, Dominion Fruit Inspector for Nova Scotia; R. W. Starr, the veteran grower and judge, Wolfville, N. S.; Prof. Macoun, Dominion Horticulturist, Ottawa; Prof. Percy Shaw, Nova Scotia Agricultural College, Truro, N. S.; and Prof. J. W. Crow, O. A. C., of Guelph, Ont.

The various fruit growers who contributed to the success of the show by exhibiting their fruit were: F. A. Hubbard, Frank Scott, Randall Bros., W. P. Fox, W. S. Maxwell, C. E. Dixon, John P. Jewett, J. C. Gilman & Son; A. H. Fairweather, B. J. Power, Geo. W. McAlpine, W. R. McFate, W. C. Peters, S. L. Peters, A. R. Gorham, Robt. Shaw, A. R. Slipp, J. W. Clark, W. A. Colpitts, E. L. Colpitts, Benj. Charters, G. E. Miller, Robt. F. Donald, Tappan Adney, O. W. Wetmore, W. T. Wright, I. W. Stephenson, S. B. Hatheway, H. Wilmot, C. N. Vroom, Thos. L. Alerache, A. B. Getchell and Victoria S. Vroom.

The show was what might be termed a real apple show as, with the exception of the preserves, jams, jellies and marmalades, it was apples on every side. The only other variety of fruit shown was a solitary plate of plums.

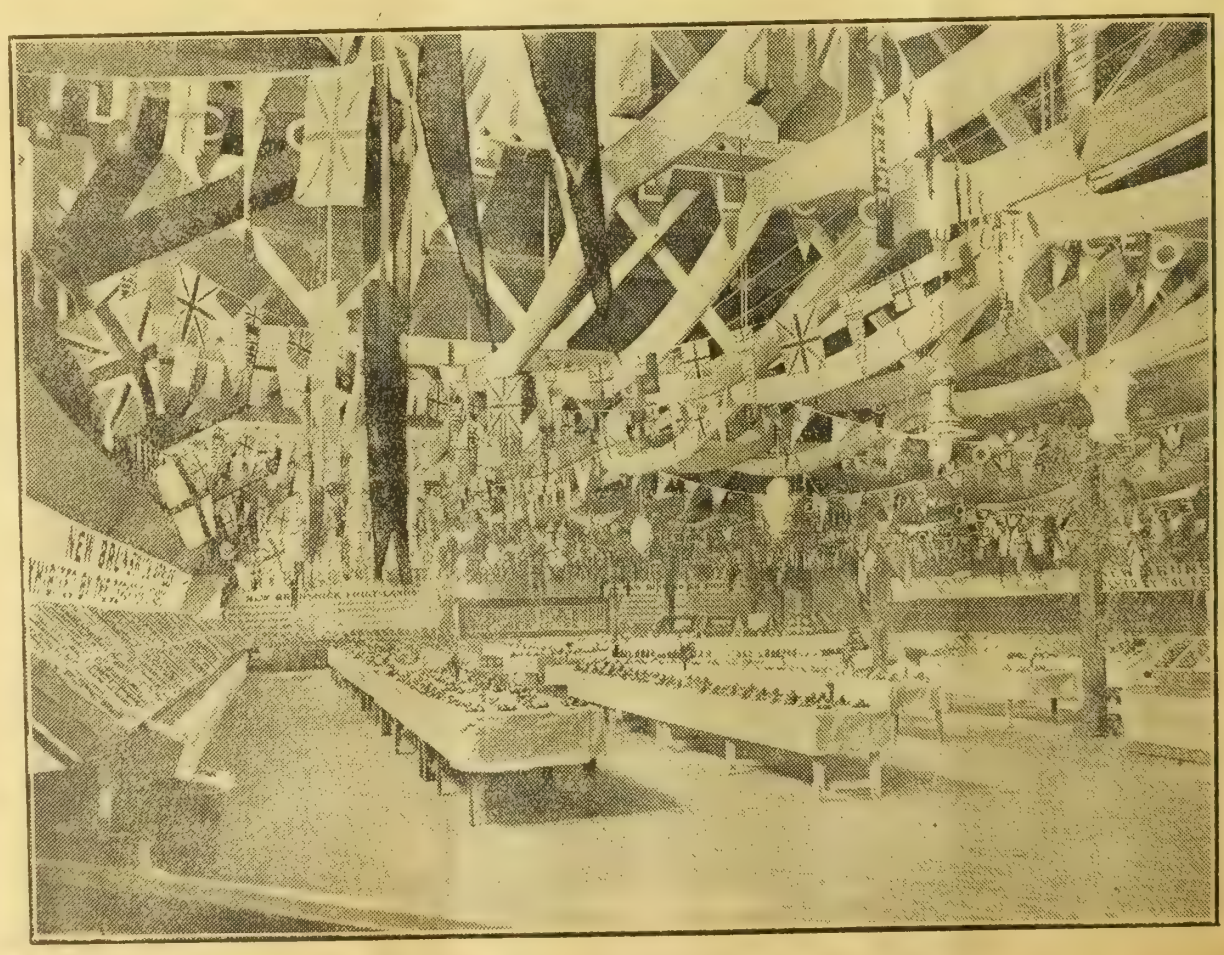
The fruit was well grown, clean and well colored.

Wealthy, Alexander, Ben Davis, Fameuse, Bishop Pippin, McIntosh Red, New Brunswicker, Talman Sweet and Duchess Apples led the way in the plate specimens in point of number of entries. There was also a fair number of entries in the Golden Russet, Northern Spy, R. I. Greening, Wolf River, Dudleys Winter Gano, Baxter, Bethel, Ontario Winter, St. Lawrence, Scott's Winter and King of Tompkins varieties.

A full list of awards will be found in other columns of this issue.

The convention was attended by representative growers from various parts of the province. Those who attended the meetings were well repaid as a series of highly instructive and interesting lectures were delivered by such noted horticulturists as Prof. Macoun, Ottawa; Prof. J. W. Crow, Guelph, Ont.; Prof. Shaw, Truro, N. S., and Messrs. R. W. Starr, Port Williams, N. S.; G. H. Nroom, Middleton, N. S., and R. C. Treherne, Ottawa on such subjects as "Points to be Considered in Establishing an Orchard," "Growing Nursery Stock in a Northern Climate," "The Cropping of Young Orchards," "Varieties of Apples, Plums and Pears for New Brunswick," "The Pollination of Tree Fruits," "The Management of Bearing Orchards," "The Control of the Brown Tail Moth and Other Orchard Pests," "The Top-working of Apple Trees," and "The Possibilities of the Over-Production of Apples" extracts

Mr. A. G. Turney
Provincial Horticulturist and Secretary of the New Brunswick Fruit Growers' Association.



A General View of the Big New Brunswick Fruit Show.

from which will be published in future issues of the Maritime Farmer.

The various lectures brought out some interesting discussions by many of our local fruit men that had a tendency to make the addresses as applicable to New Brunswick conditions as possible. No one could leave the convention without being enthused with the fruit growing possibilities of New Brunswick and also gleaning some valuable instruction from the experiences of his fellow fruit growers.

OFFICERS FOR ENSUING YEAR.

At a business meeting of the association the following officers were re-elected for the ensuing year:

Hon. President.—Hon. J. D. Hazen.

President—C.N. Vroom, St. Stephen.

Vice-Presidents—W. B. Gilman, Fredericton; S. L. Peters, Queenstown; Benj. Charters, Chartesville; O. W. Wetmore, Clifton.

Treasurer—Henry Wilmot, Oromocto.

Secretary—A. G. Turney, Fredericton.

The addresses by such public men as Hon. J. D. Hazen, Hon. Robt. Maxwell, Hon. D. V. Landry, His Worship, Mayor Frink, W. W. Hubbard, Secretary for Agriculture and others rang with optimism.

Each and every one concerned felt that Mr. Turney, the genial, energetic secretary of the association was the right man in the right place and that the success of the show and the deep interest manifested therein more than justified Mr. Turney's appointment as Provincial Horticulturist and any expense in connection with the furthering the fruit growing interests of the province.

Gano.—1, Aeo. McAlpine; 2, W. A. Colpitts; 3, S. B. Hatheway; 4, Randall Bros.

Stark.—1, A. B. Getchell, St. Stephen 2, Randall Bros

Baxter.—1, Geo. McAlpine; 2, A. P. Slipp; 3, Randall Bros.; 4, Thomas L. Alexander.

Fallawater.—1, Geo. McAlpine.

Ontario.—1, Geo. McAlpine; 2, Wm. P. Fox; 3, Randall Bros.

Salome.—1, I. W. Stephenson.

COUNTY COLLECTIONS.

Charlotte County.—1, Robt. T. Donald, The Ledge; 2, W. S. Maxwell; 3, Frank Scott.

Best collection of Apples, Albert Co.—1, W. A. Colpitts, no competition.

Best collection of Apples, Sunbury Co.—1, Randall Bros.; 2, F. A. Hubbard.

CLASS 1.—SUB CLASS C.

Wagoner.—1, Benj. Charters.

Winter St. Lawrence.—1, A. P. Slipp; 2, S. B. Hatheway; 3, I. W. Stevenson.

Canada Baldwin—1, Geo. McAlpine; 2, A. R. Gorham.

MacMahon's White.—1, Geo. McAlpine.

Scott's Winter.—1, B. Charters; 2, A. H. Fairweather, Hampton; 3, C. E. Dixon.

Blue Pearmain.—1, A. P. Slipp.

Longfield.—1, B. Charters; 2, I. W. Stevenson; 3, Randall Bros.

Any other variety.—1, Randall Bros.; 2, Benj. Charters; 3, J. W. Clarke; 4, Robt. Shaw, New Maryland; 5, W. A. Colpitts.

CLASS 1.—SUB CLASS D.

Crab Apples Best Plate of 12.

Hyslop.—1, A. B. Getchell; 2, W. R. McFate, Golden Grove; 3, Frank Scott.

Any other variety.—1, W. A. Colpitts; 2, W. R. McFate.

CLASS 2.—SUB CLASS A.

Best plate of five apples for competition by growers only of Sunbury, Queens, Kings and Albert Counties.

Northern Spy.—1, Geo. McAlpine; 2, Randall Bros.; 3, Cecil Peters.

King of Tompkins.—1, Geo. McAlpine.

Bishop Pippin.—1, A. P. Slipp.

Golden Russet.—1, Geo. McAlpine; 2, Randall Bros; 3, A. P. Slipp.

Ben Davis.—1, Geo. McAlpine; 2, J. W. Clarke; 3, W. A. Colpitts.

Blenheim Pippin.—1, Geo. McAlpine; 2, R. E. Flewelling.

SUB CLASS B.

For competition only by growers in Carleton, York, Charlotte, Westmorland and Kent Counties.

Wolf River.—1, Benj. Charters.

Bishop Pippin.—1, S. B. Hatheway.

Charlamoff.—1, S. B. Hatheway; 2, Benj. Charters.

Any other variety.—1, S. B. Hatheway; 2, W. A. Colpitts; 3, J. W. Clarke; 4, Geo. McAlpine.

SUB CLASS C.

For competition only by growers in Madawaska, Restigouche, Gloucester, Northumberland, Victoria and St. John counties.

Wealthy.—1, W. R. McFate.

Fameuse.—1, W. R. McFate.

CLASS 3, COUATY COLLECTIONS.

St. John.—1, W. R. McFate.

Gloucester.—1, M. P. Smith, New Bordon.

Queens.—1, Geo. McAlpine; 2, S. L. Peters.

Kings.—1, A. R. Gorham; 2, A. H. Fairweather; 3, C. E. Dixon.

Westmorland.—1, B. Charters.

Carleton.—1, T. Adney.

CLASS 4.

Best ten varieties grown in New Brunswick, 5 specimens of each.

1—Randall Beos.

2—Geo. McAlpine.

3.—B. Charters.

4.—S. L. Peters.

5.—C. N. Vroom.

CLASS 5, SWEEPSTAKES.

Best collection of Apples grown on any one farm in New Brunswick.

1.—Geo. McAlpine.

2.—Randall Bros.

3.—B. Charters.

CLASS 6, EXPORT VARIETIES.

Barrel ready for shipment.—1, Wealthy, J. C. Gilman & Sons; 2, Ontario Randall Bros.; 3, Canada Baldwin, Geo. McAlpine; 4, Ben Davis, W. J. Clarke.

Boxes ready for shipment.—1, McIntosh Red, J. C. Gilman & Son; 2, Ontario, Randall Bros.; 3, Canada Baldwin, Geo. McAlpine; 4, Golden Russet, W. Cecil Peters.

DOMESTIC VARIETIES.

Barrels ready for shipment.—1, Bishop Pippin, W. P. Fox; 2, Fameuse, S. B. Hatheway; 3, Alexandra, J. C. Gilman & Son; 4, Grimes Golden, Randall Bros.

Boxes ready for shipment.—1, Bishop Pippin, J. C. Gilman & Son; 2, Bishop Pippin, Geo McAlpine; 3, Fameuse, Randall Bros.; 4, Wealthy, J. W. Clarke.

SPECIAL PREMIUMS.

ALBERT COUNTY.

Best Barrel winter apples—1, Max Coulding, W. A. Colpitts.

Best Box of Wealthy.—1, W. A. Colpitts; 2, Geo. E. Miller.

Best Box of Alexander.—1, W. A. Colpitts.

Best plate five Seedling Apples.—1, W. A. Colpitts.

CHARLOTTE COUNTY.

Best plate of fine Seedling Apples.—1 and 2, C. N. Vroom.

QUEENS COUNTY.

Best barrel of Winter Apples.—1, Northern Spy, Geo. McAlpine; 2, Pippin, S. L. Peters.

Sir Rooker Posch Artis.

Grand Champion Holstein Bull at the Dominion Exhibition, St. John, and at Halifax. Owned by Samuel Dickie & Sons, Central Onslow, N. S.

Best barrel Bishop Pippin.—1, Slipp Bros., Upper Hampstead.

Best box Winter Apples.—1, Golden Russet, Geo. McAlpine; 2, Bishop Pippin, S. L. Peters.

KINGS COUNTY.

Best Barrel Winter Apples.—1, Ribston Pippin, A. H. Gorham.

Best Box North Star, Alexander or Wealthy.—1, Alexander, A. R. Gorham 2, Alexander, A. H. Fairweather.

SUNBURY COUNTY.

Best exhibit of Apples.—1, J. W. Clark; 2, F. A. Hubbard. Prizes offered by Hon. J. D. Hazen.

ST. JOHN COUNTY.

Best collection of twenty-five plates—1, W. R. McFate.

COMPETITION OPEN TO ALL COUNTIES.

Best Barrel Winter Apples—1, Golden Russet, J. C. Gilman & Son; 2, Golden Russet, Geo. McAlpine; 3, Bishop Pippin, A. R. Gorham.

Best Box of Apples—1, Bishop Pippin, A. R. Gorham; 2, Golden Russet, J. C. Gilman & Son; 3, Fameuse, A. H. Fairweather.

Best Exhibit of Apples (perfect spray pump)—1, Randall Bros.

CLASS IX.—PRESERVES.

Strawberry—1, Frank Scott; 2, A. R. Gorham.

Raspberry—1, E. L. Colpitts; 2, Frank Scott.

Current.—1, A. R. Gorham.

Gooseberry—1, W. R. McFate.

Blueberry—1, Frank Scott; 2, W. R. McFate.

Plum—1, A. R. Gorham; 2, E. L. Colpitts.

Blackberry—1, A. R. Gorham.

Pear—1, E. L. Colpitts; 2, W. R. McFate.

Crab Apple—1, A. R. Gorham; 2, Frank Scott.

Any other preserve—1, W. R. McFate, quince; 2, A. R. Gorham, rock cranberry.

Best collection of preserves.—1, W. R. McFate.

CLASS X.—JELLIES.

Currants—1, J. C. Gilman & Son; 2, V. S. Vroom.

Crab Apple—1, A. R. Gorham; 2, W. R. McFate; 3, V. S. Vroom.

Apple—1, J. C. Gilman & Son; 2, Frank Scott; 3, A. R. Gorham.

Pear—1, J. C. Gilman & Son; 2, W. R. McFate.

Plum—1, W. R. McFate; 2, E. L. Colpitts; 3, J. C. Gilman & Son.

Any other variety—1, V. S. Vroom, quince 2, A. R. Gorham, cranberry. 3, W. R. McFate.

CLASS XI.

Fruit bottled for exhibition purposes—1, Geo. McAlpine; 2, A. R. Gorham; S. L. Peters.

Umbilical Hernia.

M. E. J., Queens Co., P. E. I.—I have a fine young mare of blooded stock that is ruptured at the navel. This blemish makes her look a little worse than common as the rupture is about the size of a hen's egg. How can the blemish be remobed?

Ans.—The blemish is called Umbilical Hernia caused by the passing of a portion of the bowel or omentum through a rupture at the navel thus, causing a lump or tumor at that point. There are several methods of treatment, but the one I have been most sdccess with is what is called the covered operation. I use wooden clamps about five or six inches long for such a case as is above described. Have the clamps grooved along the middle centres then tie one end of each together being sure that the clamps are perfectly clean. Keep the animal on short feed for twenty-four hours to have the bowels as empty as possible and then cast the patient and turn it over on its back. While in this position, gently press the contents of the lump through the opening, into th? abdominal cavity, and gather up a good fold of skin over the opening, being careful not to have any bowel in the sack. Then slip the clamps between the hand holding the skin and the abdomen, and squeeze the loose ends of the clamps well together and tie them with a good strong cord making sure that the clamps are tight enough to arrest the flow of blood through the ebclosed skin. Then allow the animal to rise and place it in a stall, tying its head so as to prevent its getting at the clamp with its teeth. Feed only sufficient food to sustain it. Do not allow distention of the bowels until the skin enclosed in the clamps drop off, when it will be found, in the majority of cases, that the rupture is cured. If convenient, it is advisable to have a skilled veterinary surgeon perform the operation. J. STANDISH, V. S.

Retail Merchants are Boosters.

At a meeting of the Retail Merchants of Nova Scotia, recently held in Halifax, it was resolved to do their utmost to boom Nova Scotia and work to make the population of their province come up to the million mark by 1915. The primary object of the association is to benefit the retailer and to help him to solve the peculiar problems that arise from time to time. ...

Some of our most progressive men are ranked in the list of retail merchants. They are first and foremost in everything that tends to give their respective districts an onward and upward movement in the line of progress.

There are others numbered amongst them who are most given to knock. ing than boosting—they never have time to attend agricultural meetings held in their vicinity—they are not interested in farming. If the attempt to bring all these knockers into the fold of the association will change them so that they will become boosters, the work of the association will not be in vain.

THE MARITMIE FARMER

And Co-operative Dairyman.

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association The Nova Scotia and P. E. Island Fruit Growers' Associations The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers Association, and The New Brunswick Poultry Aassociation.

Subscription Price **$1.00** per year. **When paid in advance 80 cts.** Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front Page is, in every case, the time which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser be said :—**"I saw" your adv. in the MARITIME FARMER.**

THE OPPORTUNITIES FOR A FARMER'S BOY.

There was a time, not long ago, when the farm boy had no opportunity to study the science and art of farming in a systematic way. There were no agricultural schools or colleges. The entire system of learning was to educate the boy away from the farm and prepare him for the so-called higher professions of life. The attitude of the schools have been something like this: Anyone can farm, you do not have to learn how. You just know how without learning. If a boy was not bright enough to do anything else, then he should be a farmer. Strange as it may seem it has generally been held that farming was a simple occupation and suited only to simple minded and ordinary persons, but through the advent of experiment stations, agricultural schools and colleges, there has been a wounderful transformation in the minds of many people, and they now look upon agriculture as not only a useful occupation, but one that offers a wide field of scientific thought and investigation. The most thoughtful men of our age realize that the science of agriculture is most complex, and that the investigations that have been made for the benefit of farming have only lead us to realize how much there is to learn. Agricultural experiment stations have but started to discover the hidden truths of the soil and to unfold the mysteries of plant and animal life. The more that is learned about these things the more it is realized that agriculture offers a rich field for investigation.

It takes men of wisdom to solve nature's problems, and instead of farming being a simple occupation, as it was perhaps in the beginning, it has become one of the most complicated sciences, and is making all science subservants to its cause. As it has been said: "It is the art of arts, the science of sciences, and when every other art and science shall have been thought and wrought out to the utmost limit, the science and practice of agriculture will still present boundless unexplored fields for work and research and reward, wherein every faculty of mind and body with which man is endowed may find the fullest, the most satisfying, the most inspiring exercise and employment."

Enough is said about the opportunity for thought and research. The question is: When can a young man who desires to become an intelligent farmer, go to get some information that will help him to make his life more profitable? The answer is, to the agricultural school or college where all the different branches of agriculture are taught.

There is no excuse in these times for a young man being ignorant upon the subject of agriculture. He has every chance to become an intelligent farmer. If he cannot leave home to attend a full course in agriculture, he can manage some way, if he will, to attend a short course which is offered by our agricultural institutions.

Now is the time for the young man to make arrangements to attend some agricultural school or college this coming winter. We have never heard of the man who regretted the time he spent in preparing himself for his chosen profession. But many a man regrets that he gave so little attention to his early education in agriculture.

The Truro college is now open and young men from the Maritime Provinces will find that the theory and practical work dissiminated there will conform more nearly to our local conditions than that set forth in any other college.

AN EDUCATIONAL FEATURE.

EDITOR MARITIME FARMER :—

I have just completed reading essays writen by farmers' sons and daughters under twenty-one years of age for the Elgin Fair, and wish to take this opportunity to publicly express my appreciation of this splendid feature which the Elgin Fair Board have introduced. This feature includes three separate competitions :

1st—An essay on "The Cultivation of Soil."

2.—An essay on "The Advantages of Farm Life."

3.—An essay on "The Relation of Trees to Agriculture."

While none of the essays were as comprehensive or well written as the same writer will be capable of doing in a few years time, yet everyone evidences considerable thought and a knowledge of matters agricultural which really surprised the examiner. I doubt if there was a more educational feature introduced in the whole prize list of the Fair and I hope that the Board of Management will see fit to continue this feature, for it cannot but be productive of good in interesting the young people in the various features of farm life.

M. CUMMING,
Principal Agricultural College.

THE SCRUBS MUST GO.

It is a maxim among those best informed on the subject that the sire is much more than half the herd in all domesticated animals. Intelligent breeders all recognize the absolute necessity of an unbroken "blood line" in the sire, but thousands of our farmers who have not taken time to get their heads above the plow-handles long enough to attend the fairs, or read good agricultural papers, are still plodding along and breeding their stock, especially cattle, just any old way, simply to increase the number or get them to produce milk be the quantity much or little, and many times to avoid the payment of a reasonable breeding fee. If the live stock interests of our country is going to increase we must everlasting preach the gospel of improved pure bred sires for our herds and flocks. "The scrub must go" is the hand-writing on the walls of our barns and stables and all our lands, whether he be swine, bovine or equire. Improved methods, improved breeding, improved implements, improved seed, are the order of the day—and a failure to adopt, which in this hustling age will certainly bring to grief all who stay in the old ruts. Life is far too short to fool our time away with profitless stock of any kind.

The competition in everything is becoming so sharp that people are being forced to keep informed or they will be relegated to the rear.

When our provincinal fairs were first opened, they caught us in a state of total unpreparedness, as it were and very few pure bred animals could be produced for exhibition by local breeders. We owe a great deal to these breeders now-a-days, they have had the energy and wistfulness for instruction in their respective lines that they have visited places where large exhibitions have been held. The eyes of their understanding have been opened, their ideals have been formed and now we are able to see local stock in the exhibition sheds at St. John, Halifax and Charlottetown, to say nothing of other smaller shows, second to none in Canada.

A visit to these shows where one can see such an array of pure bred animals would be a revalation to many and one could not leave without turning over a new leaf and resolve to breed along the lines of practical common sense. The high grade herds of cattle shown this year at the various exhibitions are the outcome of breeding judiciously to pure bred sires only. This system of up breeding our herds is within the reach of the poorest farmer in Canada. Breed to pure bred sires for the scrub is fast becoming a thing of the past.

HOUSE THE IMPLEMENTS.

There is no practice so expensive and so evident of lack of thought as the one, too common by far, as leaving implements standing out in the fields, at the mercy of the weather. At the present time labor is so scarce and the wages demanded so high, that the farmer is compelled to depend more and more on machinery to help him out of his difficulty. Implements, left in the open, depreciate rapidly, and their period of usefulness is cut short long before there is any reason for it. Yet in the country, binders, mowers and other machines may be seen scattered over the land, token of carelessness and improvidence. Exposing to the weather means oxidation or rust, injuring, and, in time, weakness in the working parts, rotting of the wood and general ruination of the implement. It is not always possible to bring the binder up to the shed every night, but at the end of the season it should be housed and all dirt cleaned off and every part likely to rust given a coat of oil. The canvass, too, should be removed and placed in a dry place out of reach of rats or mice. All implements not in use should be housed; there is not only the damage from weather to be thought of, but also danger to the stock, the cattle or horses may break the machines or may receive injury from running against sharp joints or levers. A coat of paint to the woodwork and oil to the metal parts will lengthen the lives of the machinery, lighten the work, and make things in general run more smoothly. One advantage of having the implements all under cover is, that in the spare hours of the winter, they may be overhauled and examined for defects and breakages, which may be put right, and valuable time saved in the spring so that when the spring rush begins everything is ready and no time need be lost adjusting and repairing breakages. Machinery at the present time costs too much to be lightly treated. A shed and the additional time involved in painting and oiling is a better and more paying investment than the continual buying machines to replace those that are broken down instead of worn out through many years of careful usage.

THE MARITIME WINTER FAIR.

Don't forget the Maritime Winter Fair dates.. December 5th to 8th inclusive. The winter fair is the most educational show held during the year and you should not spare any effort to attend. The railway rates are so rediculously low that you cannot afford to stay at home.

Their Questions and Comments on Live Stock and Farm Produce at the Exhibitions are Enough to Make a Horse Laugh.

For a long time it has been the fashion for city people to poke fun at the farmer when the latter is in a big city, but to an unprejudiced observer, the city man when out of his element is just as impossible, makes as many silly comments and asks as many "fool questions" as the most farmerish farmer.

"A city man about sixty years old, came through here," said one of the men looking after the Jerseys of B. H. Bull & Son, of Brampton, "and, pointing to our cattle, said, "Are those Guernseys or Dairy Shorthorns?"

That's just a sample of the city people's remarks in the cattle barns. One woman doing the barns had no trouble picking out the bulls from the cows, because she was sure that any without horns were what somebody else called "gentlemen cows." Jersey cattle were given the name of practically every other breed. Many people asked questions that showed that they hadn't the faintest idea how milking was done. It was only natural that the young fellows in charge of the cattle should do a little "kidding," and one of them had no difficulty in getting a city chap to believe that "we milk that one with a washtub, and she usually fills it."

"Do you polish their horns to make them shine?" was what might be called foolish question 1111, and the attendant would be pardoned if he had answered, "No, to make them milk better." A man who was paring a cow's hoofs was asked in all seriousness by a woman, "Are you paring her nails, sir?" And some people who saw a man milking by hand were quite taken with the way the "milking machine" worked. It seems hard to believe the man who states that he heard two women discussing whether a cow was milked by pumping her tail, but he swears that it's the truth.

"Anything big and fat takes their eye," said a man who, like all the other attendants, found that it was simply size and not quality that

"Do you polish their horns to see the good points of a calf, although they call it a 'pretty little thing."

Horses being seen in the city, the city folk don't ask so many silly questions about them as about cattle, but it was a surprise to some city people to find that horses are cleaned. And, as with the cattle, the attraction was size. One horseman summed up the city people's viewpoint by saying, "If he's a big horse, he's a good one."

It's size also that takes the city people's eye when they're wandering through the hog pen, although the women folk rave over the "baby pigs." The pigs of the between sizes may have all the good points possible for a pig, but to the city folk in general he's just a pig. And, as in the horse and cattle stables, the men looking after the pigs have hard work keeping from laughing at some rematks the city people make. All kinds of guesses are made as to the breed of the "grunters," and when the guessing contest gets too hot, the attendant settles everything with some such remark as, "Oh, the ones in that pen are razor backs."

The attitude of the attendants was well stated by a man who was looking after his own sheep exhibit. "We don't mind giving all the information we can to people who don't pretend to know," he said, "but we have no use for the know-it-all from the city. You hear a youngster say, 'What kind of sheep is that, daddy?' and the father answers, "That's a Short-horn,' and proceeds to tell where the Short-horn came from. The man is the head of the house. He's the main guy, and he has to keep up his reputation." City folks go looking through the sheep pens for Berkshires as well as Short-horns; indeed they get the breeds of animals beautifully mixed. Seeing the metal tags on the which sheep are registered, one woman said, "Oh, look! They put ear-rings on the sheep to make them look pretty." It happened that a small breed of sheep were right next to a breed of large size, and the usual remark concerning the two kinds was, "These are the lambs and those are the sheep."

"They think we're shearing the sheep when we're merely doing a little clipping," said a man who looks after some of the sheep. "Yes, the city people rave over the very big sheep or the very little ones. They make remarks that a?e too funny for anything, and they ask questions that you wouldn't believe possible. But the children are getting better. The youngsters are getting to know more, and I suppose it's because they soak in a little nature study at school."

Among the exhibits of vegetables the city people rave over the big mangels, big pumpkins, big squash, and big cabbage. And the way they mix the names of the various exhibits makes one think of vegetable soup.

And so it goes all down the line of things that are from the farm. The man looking after the poultry said that he sometimes has to "go away and laugh" at some of the things said to him by the city folk. And the man who was talking bees to all who wished to learn about the busy little things, was somewhat surprised to have a city man proudly give utterance to this rich bit of wisdom: "If you hold your breathe a bee can't sting you."—Canadian Farm.

Producers Prices Staying up.

Andrew Cottingham, a farmer to whom the cackle of the hen and the early morning salute of the rooster has such an appeal that he keeps from three to four hundred of them around his farm near Brantford the whole year round, visited St. Lawrence market this morning to make arrangements for autumn for his poultry, says the Toronto News of Sept. 12th, 1910.

"The people of Ontario do like nice young chickens," was a statement Mr. Cottingham made, and they are willing to pay the price for it. The market for poultry is improving all the time, but Ontario farmers seem slow to realize this, and the consequence is that the supply never exceeds the demand. On a large scale chicken raising is one of the most profitable branches of farming in existence.

"A good hen will pay 100 per cent. on the investment and often twice as much, while it is a good cow that pays 50 per cent. on the moneyinvested in her. Chickens, however, need attention and shodld be studied."

Mr. Cottingham was reluctant to give an opinion as to about how much the poultry lovers of Ontario would have to pay this fall for their favorite dish but that it would be in excess of the present price of 18c. to 25c. a pound he felt pretty sure.

"This Christmas will be a bonanza to the chicken raisers," he concluded.

There is no doubt that Mr. Cottingham is absolutely right in his statements. Poultrying is unquestionably being neglected in Ontario—is not getting the attention that its enormous profits warrant.

In his recent "open letter" to Ontario's Minister of Agriculture, Mr. Flavelle called attention to this same state of affairs. He pointed out also that the demand far exceeded the available supply. "Last fall," he said, "one firm in a town in Ontario took orders in the Pacific Provinces and in British Columbia for 40 car loads of poultry, in all 1,300,000 pounds. They were sold at prices that netted the shipper 16c per pound on board cars in Ontario.' Again he says: "Recently, on a visit made to the east, a wholesale dealer from Victoria, B. C., made purchases of 23 car loads of eggs (10,350 cases of 30 dazen each) at a price approximating 24c. per dozen f. o. b. cars in Ontario. Winnipeg merchants during this last week, have been enquiring for 20 car loads of eggs for shipment this fall. Other wholesale merchants in Winnipeg, Calgary, Vancouver and Victoria have trade calling similar supplies.

A number of his critics—practical farmers all of them—concur in one of Mr. Flavelle's statements that is, that "the farmers of this and other provinces have been diverted from poultry raising. "Why? Because they were being deprived of a legitimate share of the returns for their labors. This has unquestionably had a great deal to do with the small output. The farmer does not want to produce and then have his prices forced down to where there is no profit for him. Consequently he has simply decreased production. But the farmer would increase production tomorrow were he assured of present prices continuing—were he assured that he would not be at the mercy of the cold-storage firms and the grasping middleman.

Thus far, this country has seen only one practical effort to increase the producer's profits. We refer to the Peerless Way Co-Operative Plan that is being advocated by the Lee Manufacturing Co., Ltd., of Pembroke. Ont., and which plan has been in full operation on their big farm—the Poultry Yards of Canada. This firm is not trying to take the place of the cold storage house ar the middle man; but is making a determined effort to teach the farmer's how, by team-work, they can secure higher prices for their products. The Lee people realize that the bigger more aggressive farmers have practically dropped poultrying because they have not been getting their fair share of the profits. This farm has already shown its 15,000 co-workers not only how great are these larger profits but has also demonstrated in a very practical way how to get these profits.

From the success with which the Lee Manufacturing Co., Ltd., has met and is meeting, it is perhaps not unsafe to prophesy that the revival of poultrying in a big way in Canada, hinges strongly upon the Peerless Way idea— co-operation circles and co-operative marketing. This seems to be the solution of the farmer getting full price for his labors.

A Popular Appointment.

Mr. E. S. Arxrhibald, B. A., B. S. A., has been appointed Agriculturist and Farm Superintendent at the Agricultural College, Truro, N. S. Mr. Archibald is a Nova Scotian and is a graduate of Acadia University, the Nova Scotia Agricultural College and the Ontario Agricultural College, of Guelph. During the past two years he has been on the staff of the Agricultural College at Truro in the capacity of lecturer in Live Stock and Field Husbandry and Experimentalist. Mr. Archibald's home is in Wolfville, N. S., his father being Mr. E. E. Archibald, President of the Nova Scotia Fruit Growers' Association. He has had a wide experience in farming both in Nova Scotia and other parts of Canada. As a student at Guelph, he was one of a team of five, who, in a Live Stock Judging Competition at Chicago, open to all the agricultural colleges of America, won first prize. Since coming to Nova Scotia he has judged at a number of exhibitions and has spoken at a number of Farmers' Meetings. As a lecturer at the College during these years, he has been highly successful. His appointment is a strong addition to the staff of the Nova Scotia Agricultural College.

The Farmer's Income.

How often do we hear a farmer speak with more or less concealed envy of a professional man or official having a salary of $5,000, $2,000 and even $1,200! "Why," he will say, "I work harder than any and last year I made only $6000," mentioning the amount which he put in the bank after paying all his own and family's expenses. And this position is taken, more or less all over the world.

In Sweden—under a new taxation law—the farmers will have their eyes opened as, in making their declaration of income, it is specified that they must credit the farm—as an income—house rent, all home-grown products consumed; the expenses of carriage and riding horses; not used in the farm work, of parks and flower garden as well as the servants attending the personal household—anything and everything contributing to the farmer's and his family's personal comfort or pleasure—must not be charged as farm expenses in making up the farm income, but as personal expenses.

If those farmers who now envy the professional men their salary, and complain that farming does not pay, would keep an honest account with the farm and credit it with all its due from house rent and fire wood to green peas, potatoes and strawberries consumed and given away, there would be an end to that envy.

Uses of Sawdust.

Sawdust is usually regarded as an objectionable product because it increases the danger of fire if deposited near mills or lumber piles and necessitates either cartage with accompanying expense or the construction of a "burner" and the use of conveyors or carts to transfer it from the saws.

A double economy, however, is now in progress. As a result of the use of band saws instead of the old circular and gang saws, a log that under the old system produced 8 boards, will now produce 9, a very substantial increase in product with a corresponding decrease in the amount of sawdust produced.

Owing to its chemical and mechanical properties, it has an ever increasing field of usefulness. Used as an absorbent for nitro-glycerine, it produces dynamite. Used withclay and burned, it produces a terra-cotta brick full of small cavities that, owing to its lightness and its properties as a non-conductor, makes excellent fire-proof material for partition walls. Treating it with fused caustic, alkali produces oxalic acid. Treating it with sulphuric acid and fermenting the sugar so formed, produces alcohol. Mixed with a suitable binder and compressed, it can be used for making mouldings and imitation carvings; while, if mixed with Portland cement, it produces a flooring material. It is an excellent packing material for fragile articles and for dangerous explosives and can be used as packing in walls to make them sound-proof and cold-proof.

HORTICULTURE

Wm. O'Brien Surprised and Caned.

One of the pleasing events that took place at the close of the Nova Scotia Horticultural Show, which was recently held in Windsor, N. S., was the presentation to Mr. William O'Brien, president of the show, of an address and gold headed cane.

The address was read by Col. Spurr who took occasion to refer in complimentary terms to Mr. O'Brien's work in connection with the fair, and also as a member of the Fruit Growers' Association, of which he was a valued member.

ADDRESS.

The address was as follows:—

Wm. O'Brien, Esq., President of N. S. Horticultural Exhibition.

Esteemed Sir,—A number of exhibitors at this Exhibition, and other friends, appreciating your efforts in connection with this and other Exhibitions, feel at this time that they should in some way show their kindly feeling toward you and ask you to accept the accompanying gift, not for its intrinsic value, but in token of our esteem.

On behalf of the contributors,

S. SPURR.

Mr. O'Brien, who was taken completely by surprise, expressed his cordial thanks for the gift, and also for the good-will which prompted it. It had been a pleasure for him to meet and work with his associates in conducting the affairs of the exhibition, and in putting forth every effort to make the show a success, he felt they were but doing their duty.

President Taft on Apples.

"I have always loved apples and always eaten them. Indeed, my father used to tell of his uncle, who said he disliked apples so much that he wouldn't put his mouth out of pucker for less than a peck. I have inherited that taste myself. And I have very decided opinions about apples.

Apples are a good deal like persons. You take the Ben Davis and the King apples, as I know them. They are fine when you see them on the stand for sale and they are beautiful when you see them on the table, but if you are a real lover of apples and put your teeth into them, you know that they are just as much frauds as some people that you know; that they are mealy and they haven't that sort of juice that means character, and they haven't that sort of flavor that means character in an individual.

Now, I don't know whether you have out here any apples that are not as large and fine as those I have seen. For what you do with apples that don't look well I would like to know. I can't find out except by spending some time here, for you are so combined in featuring the best in your communities that you hide those apples where no man can find them."

Women Succeed With Fruit.

It is a common thing these days to find women who for some reason or another have decided to make a living for themselves and those depending upon them through agriculture. One such instance is the inspiring example of a Maine woman in Somerset county, who makes a specialty with fruit. After her husband's death she started to raise strawberries and has not only provided a living for herself and family, but educated the children as well. Her husband died, leaving three small boys, the oldest 14, and only 10 acres of land. There was a bed of about one-quarter acre strawberries. More plants were set and the children came in handy at harvest. The berries were peddled from house to house at a price near 15 cents a quart. The second year the returns from the strawberries were $488. Her methods are best given in her own words:

"I aim to get land sloping a little toward the west. In this way they are not so likely to be killed by ice in the winter and will also receive more benefit from the sun. Plow and harrow the ground thoroughly, using a good dressing of stable manure and perhaps ashes. We set plants in rows 4 feet distant and plants 1 foot in the row. A fine-tooth cultivator is used through the season, placing the plant runners lengthwise in the row. Keep the dirt away from the plants rather than bringing it to them.

"Pick the blossoms the first year. We cover plants in the late fall with straw or evergreen boughs which protect them from snow and ice to some extent. Remove this covering early in the spring and do not touch the plants again until you begin to pick the berries. We keep a bed only one season, setting a new one each spring."—New England Homestead.

N. S. Horticulture Exhibition Prize List.

Judges—Chief McNeil, of the Fruit Division, Ottawa; Robt. Starr and S. C. Parker.

APPLES.

Best and most valuable collection not to exceed 20 varieties, 5 specimens each. 1, Sea View Farm, A. Starr, Starr's Point; 2, H. A. D'Almaine; 3, L. E. Healey; 4, Arthur Johnson; 5, H. E. Bent.

Best collection 10 commercial or export variety. 1, Sea View Farm; 2, C. N. Wilson; 3, A. Johnson; 4, H. D. Johnson; 5, H. E. Bent.

Best collection of 5 commercial or export varieties, 5 specimens each. 1, G. N. Banks; 2, Sea View Farm; 3, A. Johnson; 4, H. Loomer; 5, R. Duncanson.

Best 5 varieties Counties Hants, Kings Annapolis not eligible. H. T. Hebb, Lunenburg.

Best Gravenstein. 1. H. D. Johnson, Wolfville; 2, W. M. Woodworth, Berwick; 3, John Doyle, Blomidon, Kings County; 4, Hugh Hanna, Falmouth; 5, Nova Scotia Freemason's Home, (Rev. J. B. Merrill); 6, Inglis Smith, Falmouth.

Best Ribstons. 1, G. W. Banks, Morristown, Kings Co.; 2, L. H. Wallace, Newport Landing, Hants Co.; 3, H. A. D'Almaine, Starr's Point; 4, J. A. Magee, Port Williams; 5, H. Loomer, Falmouth; 6, Wm. Frank, Windsor.

Best Blenheims. 1, C. R. Harris, Hillaton; 2, L. E. Healy, Church St., Kings Co.; 3, Sea View Farm, Starr's Point; 4, S. A. Bowser, Grand Pre.; 5, A. Johnson, Wolfville; 6, J. A. Magee.

Best Kings. 1, Sea View Farm; 2, James R. Gow, Grand Pre.; 3, W. H. Woodworth; 4, A. Johnson; 5, H. A. D'Almaine; 6, L. E. Healy.

Best Golden Russet. 1, J. A. Magee; 2, H. E. Bent, Tupperville; 3, W. H. Woodworth; 4, Sea View Farm; 5, B. F. Chesley; 6, G. N. Banks.

Best Baldwin. 1, G. E. Magee; 2, W. H. Woodworth; 3, L. A. Magee; 4, G. N. Banks; 5, H. E. Bent; 7, S. A. Bowser.

Best Stark. 1, Sea View Farm; 2, R. S. Palme?, Windsor Forks; 3, H. A. D'Almaine; 4, H. E. Bent; 5, A. Johnson; 6, John Doyle.

Best Spys. 1, Mrs. A. C. Chesley, Upper Clarance, Annapolis Co.; 2, F. Smith, Falmouth; 3, W. C. Dunlop, Falmouth; 4, C. O. Martin, Falmouth; 5, A. J. Smith, Falmouth; 6, Inglis C. Smith.

Best Fallawater. 1, A. Johnson; 2, Sea View Farm: 3, L. E. Healy; 4, J. A. Magee; 5, H. A. D'Almaine; 6, H. E Bent.

Best Nonpareil. 1, H. A. D'Almaine; 2, C. N. Wilson, Falmouth; 3, G. E. Magee; 4, Sea View Farm; 5, J. C. Smith; 6, J. A. Magee.

Best Cox's Orange. 1, Thos. Aylward; Falmouth; 2, B. Woodworth; 3, D. W. Withrow, Avondale; 4, Chas. N. Wilson; 5, C. R. Harris.

Best Alexander. 1, H. Loomer; 2, Sea View Farm; 3, L. E. Healy; 4, A. Johnson; 5, H. A. D'Almaine.

Best Bank Gravensteins. 1, C. N. Banks; 2, P. C. Inglis; 3, C. R. Harris.

Best Ben Davis—1, C. R. Harris; 2, S. C. Hall; 3, Sea View Farm; 4, A. Johnson; 5, H. A. D'Almaine.

Best Gano. 1, H. A. D'Almaine; 2, H. Hanna; 3, H. D. Johnson; 4, Sea View Farm; 5, Mrs. Wm. Sangster.

Best Hubberson. 1, Mrs. A. E. Chesley; 2, H. D. Johnson; 3, H. E. Bent; 4, Sea View Farm; 5, H. A. D'Almaine.

Best McIntosh. 1, W. H. Woodworth; 2, Thos. Aylward; 3, J. H. Magee; 4, H. Loomer; 5, H. D. Johnson.

Best R. I. Greening. 1, G. A. Magee; 2, H. D. Johnson; 3, Sea View Farm; 4, C. W. Dill; 5, H. Loomer.

Best Red Russets. 1, J. O. Hardacker, Grand Pre; 2, H. A. D'Almaine; 3, H. Hanna; 4, S. C. Hall; 5, H. D. Johnson.

Best Seek. 1, Sea View Farm; 2, W. C. Dunlop; 3, A. C. Johnson; 4, H. D. Johnson; 5, E. E. Davis.

Best Wagner. 1, G. E. Magee; 2, C. R. Harris; 3, H. E. Bent; 4, A. Johnson; 5, H. D. Johnson.

Best Wellington. 1, G. E. Magee, 2, J. A. Magee; 3, C. N. Wilson; 4, A. Johnson; 5, H. A. D'Almaine.

Best Yellow Bellfleur. 1, H. Hanna; 2, J. A. Magee; 3, H. E. Bent; 4, B. F. Chesley; 5, H. L. Chipman.

Best Grimes, Golden. 1, H. Hanna; 2, C. N. Wilson; 3, H. D. Johnson; 4, E. Smith; 5, F. Smith.

Bent Hurlbut. 1, J. A. Magee; 2, Sea View Farm; 3, H. D. Johnson; 4, C. R. Harris; 5, A. Johnson.

Best Ontario. 1, H. D. Johnson; 2, Sea View Farm; 3, H. Hanna; 4, C. R. Harris; 5, H. E. Bent.

Best Pomme Grise. 1, Sea View Farm 2, G. W. Magee; 3, Mrs. Wm. Sangster; 4, H. D'Almaine; 5, H. D. Johnson.

Best Talman Sweet. 1, W. H. Woodworth; 2, Sea View Farm; 3, A. Johnson; 4, G. N. Banks; 5, B. F. Chesley.

Best Vandevere. 1, H. D. Johnson; 2, Sea View Farm; 3, H. D'Almaine; 4, A. Johnson; 5, G. N. Banks.

Best Wealthy. 1, J. O. Hardacker; 2, H. A. D'Almaine; 3, H. D. Johnson; 4, A. Johnson; 5, W. H. Woodworth.

Best Wolf River. 1, G. E. Banks; 2, H. L. Chipman; 3, G. E. Magee; 4, L. E. Healy; 5, Sea View Farm.

Best North Star. 1, H. M. Hanna; 2, H. Hanna; 3, C. R. Harris.

Best Mann. 1, Sea View Farm; 2, G. N. Banks; 3, R. S. Palmer; 4, A. Johnson; 5, H. A. D'Almaine.

Best Baxter. 1, J. A. Magee; 2, G. E. Magee; 3, H. D. Johnson; 4, Sea View Farm; 5, H. A. D'Almaine.

Best Pewaukee. 1, L. H. Wallace; 2, H. E. Bent; 3, H. M. Hanna; 4, C. H. McLellan; 5, L. E. Healy.

Best Esopus Spitzenburg. 1, H. A. D'Almaine; 2, W. H. Woodworth; 3, H. Loomer; 4, H. E. Johnson; 5, H. E. Bent.

Best Sweet Bough. 1, B. F. Chesley; 2, C. N. Banks; 3, P. C. Inglis; 4, H. E. Bent; 5, H. A. D'Almaine.

Best Ohio Nonpareil. 2, A. Johnson; 3, Sea View Farm; 4, H. D. Johnson; 5, H. A. D'Almaine.

APPLES IN BOXES.

Best box Gravensteins. 1, H. Hanna; 2, N. S. Freemasons' Home.

Best Ribston. 1, H. Hanna.

Best Blenheim. 1, L. E. Healy, 2, H. M. Hanna.

Best Spy. 1, Mrs. A. C. Chesley; 2, N. S. Freemasons' Home; 3, H. M. Hanna.

Best Golden Russet. 1, H. E. Bent; 2, N. S. Freemasons' Home.

Kings. 1, H. Hanna; 2, H. M. Hanna; 3, N. S. Freemasons' Home.

Stark. 1, H. E. Bent.

Nonpareil. 1, H. D. Johnson; 2, H. M. Hanna; 3, N. S. Freemasons' Home.

Baldwin. 1, H. E. Bent; 2, N. S. Freemasons' Home.

Best Ben Davis. 1, H. E. Bent.

CRAB APPLES, BEST PLATE 12

Best Transcendent. 1, Thos. Aylward; 2, H. A. D'Almaine; 3, Mrs. Wm. Sangster.

Best Hylsop. 1, R. Duncanson; 2, C. Clark; 3, J. A. Magee.

Best Montreal Beauty. 1, H. A. D'Almaine; 2, H. D. Johnson.

Best Whitney Seedling. 1, Mrs. Wm. Sangster; 2, H. D. Johnson; 3, A. Johnson.

Any other variety. 1, W. H. Roach; 2, J. O. Hardacker; 3, H. D. Johnson.

Best Col. Crab Apples, plates of 12 each. 1, H. A. D'Amaine; 2, H. D. Johnson.

PEARS.

Best Col. Commercial Pears, 10 varieties. 1, Sea View Farm; 2, H. D. Johnson; 3, B. F. Chesley.

Best Com. Pears, 5 varieties. 1, H. D. Johnson; 2, Sea View Farm; 3, H. E. Bent.

BEST PLATE OF THE FOLLOWING VARIETIES.

Bartlett. 1, H. D. Johnson; 2, B. F. Chesley; 3, H. A. D'Almaine.

Bussock. 1, Sea View Farm; 2, A. Johnson; 3, Mrs. Sarah E. Starr.

Bosc. 1, B. F. Chesley; 2, Mrs. A. C. Chesley; 3, Benj. Woodworth.

Claps. 1, I. B. Smith; 2, H. D. Johnson; 3, H. A. D'Almaine.

Clairzean. 1, A. Johnson; 2, H. E. Bent; 3, B. F. Chesley.

Commice. 1, Sea View Farm; 2, H. D. Johnson; 3, A. Johnson.

D'Anjou. 1, A. Johnson; 2, Mrs. A. C. Chesley; 3, B. F. Chesley.

Duchess. 1, H. D. Johnson; 2, G. N. Banks; 3, Sea View Farm.

Flemish Beauty. 1, H. E. Bent; 2, G. N. Bent; 3, Sea View Farm.

Great Britain. 1, H. D. Johnson; 2, H. D'Almaine; 3, L. W. Maxner.

Howell. 1, H. E. Bent; 2, A. Johnson; 3, Sea View Farm.

Hardy. 1, Benj. Woodworth; 2, Sea View Farm; 3, A. Johnson.

Louise Bonne DeJersey. 1, A. Johnson; 2, Sea View Farm; 3, Benj. Woodworth.

Onondaga. 1, H. D. Johnson; 2, H. A. D'Almaine; 3, Sea View Farm.

A BAD COLD

Developed Into BRONCHITIS.

Neglected Bronchitis is very often the direct cause of Consumption, and on the first symptom appearing Dr. Wood's Norway Pine Syrup should be used and the Bronchitis cured.

The symptoms are, tightness across the chest, sharp pains and a difficulty in breathing, a secretion of thick phlegm, at first white, and later of a greenish or yellowish color, coming from the bronchial tubes when coughing, especially the first thing in the morning.

Mrs. Dan. J. McCormack, Cleveland, N.S., writes: "My little boy two years old caught a bad cold which developed into Bronchitis. He was so choked up he could hardly breathe. Reading about your wonderful medicine, Dr. Wood's Norway Pine Syrup, I decided to try a bottle and with such good result I got another which completely cured him, without having a doctor. I cannot say too much in its praise; I would not be without it in the house as I consider it a sure cure for Colds and Bronchitis."

The price of "Dr. Wood's" Norway Pine Syrup is 25c. It is put up in a yellow wrapper. Three pine trees is the trade mark. Be sure and accept no substitute for Dr. Wood's.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

"HIRAM"

Raspberry Plants for Fall Setting.

The "Hiram" is a strong grower, hardy and very productive. Fruit deep red, extra large and very good quality. Unexcelled for home use o nearby markets. Plants by mail, post paid 50c per doz.

Ask your storekeeper for Campbells X X X Choppers. None as good. You will like them.

Campbell Bros., Sole Makers XXX Choppers,
ST. JOHN, N. B.

Many school children suffer from constipation, which is often the cause of seeming stupidity at lessons. Chamberlain's Stomach and Liver Tablets are an ideal medicine to give a child, for they are mild and gentle in their effect, and will cure even chronic constipation. Sold by all dealers.

DAIRYING.

C. W. McDougall, Dairy Inspector, staff Contributor.

Home Made Cheese.

Prof. H. H. Dean, Ontario Agricultural College, writes as follows with regard to making cheese at home:

Assuming that a man lives on a farm and has nothing but ordinary household utensils to work with, he would need the following list of apparatus and articles in order to make cheese:

1. A vessel to hold the water. A vat is best, but failing this a clean wash boiler or wash tub will answer the purpose.

2. Rennett which can be got from any dealer in dairy supplies, or can be made at home by taking the stomach of a young calf (3 to 4 days old!, drying it, then soaking in salt and water to extract the rennet. A quantity can be made at once or a small piece of the dried stomach may be soaked for 22 hours in weak brine, as required.

3. Heat. A kitchen stove, with a moderate fire in it, on which the boiler is set, will answer the purpose.

4. Some means of cutting the curd. A curd knife is best, but failing this, a long blade butcher knife may be used.

5. A cheese cloth, 3 or 4 feet square in which the curd may be drained. A rack is also convenient, but not necessary.

6. Salt for applying to the curd. Ordinary house salt may be used.

7. A hoop made of heavy tin, about 8 inches in diameter and 8 to 10 inches deep, open top and bottom.

8. A wooden follower that will slip inside the tin hoop and fit closely.

9. Some form of press. A scantling or fence rail, one end of which is placed under a door or window sill, or some other solid projection, make s a fairly satisfactory press. Have the cheese about 1½ feet from one end, and on the other end hang a pail with stones in it, adding more stones, or moving farther out to increase the pressure.

10. Some cheese cotton to wrap round the cheese before or after pressing.

11. A cool room for ripening (curing) the cheese. A house cellar is very good.

12. Paraffin wax in which to dip the cheese when about one week old to prevent drying out too mucn. This is not necessary but helps to keep the cheese moist.

MAKING THE CHEESE.

Cheese may be made on the farm in about four hours from the time the rennet is added until the curd is in the press. The milk may be night's and morning's milk mixed, or either alone, but should be sweet and clean in flavor. Heat the milk to 84 or 86 degrees Fahr., by setting on the stove or by warming a part of the milk in hot water to a temperature high enough to bring the whale lot to 84 or 86 degrees. Add 4 to 6 teaspoonfuls of rennet for each 10 gallons of milk (100 lbs.), after first diluting in a cupful of cold, clean water. Stir the rennet thoroughly through the milk, taking about three minutes to do so. Now allow the milk to set perfectly still until it is coagulated or curdled. To know this, insert finger or thermometer carefully into the curd, and when it breaks clean over the finger or thermometer, it is ready to cut.

Next cut into cubes about one-half inch in size, or as nearly this as possible. Stir gently for five minutes, then set on the stove, or take out sufficient whey, and heat it so as to bring the whole mass to 94 or 96 degrees Fahr.; or a pail of hot water may be set in the curd and whey and the whole stirred until the curd becomes cooked. When the curd feels firm and will fall apart after squeezing in the hand, the whey or liquid part may be removed, or the curd may be dipped on to a cheese cloth spread on something to assist drainage. A rack set in a vat or tub is best.

Stir the curd often enought to keep it in small particles, and when the surplus moisture is drained away add salt at the rate of two to four ounces (according to taste) for the curd from 10 gallons of milk. Stir the curd and salt until both are well mixed, when the curd is ready to put in the hoop. It is most convenient to use a "bandager," which has the bandage on the outside, and after filling the hoop, the cotton bandage remains inside and around the curd after the removal of the bandager from the hoop, but where this is not practicable, the curd may be filled directly into the hoop and the cotton bandage be put on after pressing for an hour. Put piece of cloth on top, then proceed as follows: Press gradually for an hour, then remove from the hoop and put on bandage, or straighten the bandage, if already on. Trim the edges and have the cheese as neat as possible when put back to press. Continue pressing for 24 hours, when the cheese may be removed to a cool room (not over 65 degrees Fahr.). Turn daily for one to three months, when the cheese will be ready for use. Cut pieces in circular form from one end and place the first, or rind circle, back on the cheese to prevent drying.

Advice to Beginners.

To those starting in the pure bred dairy stock business, I wish to offer a little advice.

In summing up what I have gained through many years of breeding dairy cattle, I am convicted many men are in the pure bred stock business, who ought to reform or get out. On the other hand, there are still more men, who should be in the pure bred business. They would be successful and would be benefactors in their community. To buy good stock and give it poor care through neglect and lack of feed has caused many failures in the pure bred world. As some have put it, the process of turning pure breds to scrubs, is not only unprofitable, but also revolting to the whole live stock industry.

To be a successful breeder, one must take an interest in his cows and be mindful of the work, which he has at hand in shaping the generations to come. Such little matters as keeping accurate records of breeding, birth, etc., are quite essential, and perhaps the most neglected duties of the average breeder. Calves should be registered, while they are young if the breeder has any intention of keeping them for breeders or selling to buyers who wish pure breds. Much difficulty is experienced not only by breeders, but also buyers in this matter of recording. Stock should be transfered promptly adter it is sold and papers should be sent to the buyers as soon as they come fromthe secretary's office.

The successful breeder is a man, who not only keeps posted on the literature of his breed, but who also takes an interest in all branches of the business. A dairy stock breeder should be interested in the subject of dairying. He should keep himself posted and the best way to do this is to read good, reliable papers and publications dealing with the subject. A breeder should feed his animals well, because by so doing, he will benefit himself and others, who may buy his stock. He cannot save maney by saving feed; he had better sell his animals to save feed. An underfed animal is always unprofitable and quite liable to be unsightly, or still worse to be really damaged. It is necessary that an animal be nourished in order that it may perform its work as nature intended it. To neglect such matters means, not anly an injury to yourself, but also to the men, who may buy your animals and to the breed in general.

Lastly, a breeder who has a good cow should receive the full benefit and this he can best obtain by having her officially tested. To give a cow a full advantage in an official test, she should be first put in condition. A cow will always do better after having a rest period and during such a period, she will increase in energy, if given sufficient feed to build up her body and be put in what might be termed a thrifty condition. After freshening she should be brought to full feeding slowly and if a large milker, should be milked at least three times per day.— A. L. Haecker, University of Nebraska.

What Different Experiment Stations Think of Mangles for Milk,

Many inquiries have been made through different farm papers and to experiment stations direct in reference to the value of mangels as feed for milch cows. Accordingly several experiments have been undertaken to compare the feeding value of different roots with other feeding stuffs. The following results of experiments carried on by the various experiment stations, in feeding mangels to dairy cows are found in Farmers' Bulletin 384:

At the Iowa Station more milk was obtained from mangels than from sugar beets, red table beets, or turnips, but the fat percentage of the milk was lower on the mangel than on the turnip ration, when roots were replaced with their equivalent in dry matter of wheat bran, the yield of milk fat decreased, and more pounds of dry matter were required to make a pound of milk fat. In some Ontario experiments mangels were found equal to sugar beet pulp as a milk producer. At the Pennsylvania Station sugar beets and mangels appeared to be inferior to silage as a feed for the production of milk and milk fat. At the Ohio Station the feeding of beets to milcn cows increased the consumption of other feeds and of total dry matter. There was an increase in the yield of milk, yield of milk fat, and in the live weight of the cows, but the gains were not enough to offset the additional cost of feed. At the Massachusetts Station, with 40 lbs. of mangels in the ration, cows gave less milk and cream than when they were replaced with 30 pounds of silage, and it cost more to raise the mangels than to make silage: but these results were not comparable when figured on a dry-matter basis, as the mangel ration contained only about one-half as much dry matter in the succulent part of the ration as dis the silage ration.

The Pennsylvania Station reported that the cost of growing, harvesting, and storing an acre of beets was more than double the amount required for an acre of corn, charging each crop the same rent for land and the same amount for fertilizers. As much digestible organic matter was produced in 1 acre of corn as was obtained from 1.91 acres af mangels and 2.05 acres of sugar beets. In the feeding experiment, the silage ration made more gains in live weight and

Up-to-Date Specialties For Farmers And Gardeners
Things you need—implements and tools that should be on every truck garden and farm. Our way of making these specialties assures adaptability, strength and service at the minimum price for the best goods of their kind on the market.

"Eureka" Root Cutter
will slice or shred from 1 to 2 bushels per minute. Fastest machine made—easiest running. Tapering cylinder—10 best steel knives.
"Eureka" Sanitary Churn
Barrel of finest stoneware—top of clear pressed glass. Churns by hand lever. The only sanitary churn made. 3 sizes—8, 10 and 12 gallons.
"True" Wagon Box and Rack
Without wings and ladder, it is a perfect wagon box. With them, it is the best Hay, Stock, Wood, Poultry, Corn or Fruit Rack ever invented. Adjusted to any position in a minute without wrench, hook or rope.
"Eureka" Combination Anvil
Best iron anvil, with vice, pipe vice and drill attachment, and saw clamps. Just what you need for repairing tools and machinery. Weighs 60 pounds.
The "Bacon" Seed Drill
will handle the most delicate seed without bruising or breaking, and will sow evenly to the last seed.
Write for Catalogue
Every farmer, who wants to make money out of his farm, ought to have our new catalogue. It shows our TOOLS, Rakes, Hoes and Machines as they are, and describes their construction in detail. Write for free copy.

WASTE NO TIME
On Common Cream Separators

Waste no time on common, complicated cream separators. You don't need to. You will be better pleased to have a Sharples Dairy Tubular Cream Separator in the first place—for you know that Tubulars are

The World's Best Cream Separators

Tubulars are guaranteed forever. Back of that guaranty stands the oldest separator concern on this continent. We can make that guaranty because Dairy Tubulars produce twice the skimming force of common separators and, therefore, neither need nor contain the complicated parts all common machines must have. This makes Tubulars vastly simpler, vastly more efficient and vastly more durable than others.

The manufacture of Tubulars is one of Canada's leading industries. Tubular sales easily exceed most, if not all, others combined. Tubulars probably replace more common separators than any one maker of such machines sells. Later than and different from all others. Write for catalog No. 194

Sharples 30 Yrs

Dairy Tubulars are self-oiling. No oil holes, tubes or cups.

THE SHARPLES SEPARATOR CO.
TORONTO, ONT. WINNIPEG, MAN.

Quality Butter

If you have never used a "FAVORITE" CHURN, you can't imagine what a difference it will make in the quality of the butter.

The "FAVORITE" is known all over Canada as the Churn that brings the quality butter—and gets every drop of butter out of the cream. Hand lever and foot tread —8 sizes.

"Puritan" Washer is another old favorite. Washes a tubful of clothes in five minutes. If your dealer does not handle them, write us. 74

W. T. LITTLE, Principal.
FREDERICTON, N. B.

in milk production than the beet ration per 100 pounds of digestible dry matter.

At the Vermont Station 100 pounds of dry matter, both in the entire ration and in the experimental part of the ration gave slightly greater returns when silage was fed than when it was replaced by beets, the dry matter in the silage making 1 per cent. more milk and total solids and 4 per cent. more fat. These differences are too small to be very important and in these tests it may be considered that the dry matter of each fodder had about equal feeding value. The beets cost more to grow harvest, and store, and at best produced no more and no better milk. On the other hand, beets were much liked by the cows and promoted their general health and digestion, and therefore it was thought that they might serve a useful purpose as an appetizer, particularly if no other food of a succulent nature were at hand.

In some recent experiments at the Cornell Station, 1 pound of dry matter in mangels was found to be equal in feeding value to 1 pound of dry matter in grain; and a little more than equal to 1 pound of dry matter in silage, but the cost of milk production was higher on the mangel than on the silage ration. The total dry matter required for the production of 1 pound of milk fat on hay, grain, and silage was 22.34 pounds, on a hay, grain and mangel ration 20.93 pounds, and when mangels and silage were substituted for one-half of the grain ration, 22.02 pounds. The average cost of production of a pound of milk fat on the three rations was 20.7, 27.4, and 20.7 cents, respectively.

Accepting the average price of commercial feeding stuffs at $30 per ton, and considering 1 pound of dry matter in mangels equal to 1 pound of dry matter in grain, mangels may be used economically in the ration to replace one-half the grain ordinarily fed when they can be produced and stored ready for feeding at $4 per ton. In arriving at this conclusion, the average amount of dry matter in grain is considered to be 90 per cent. and in mangels to be 12 per cent. It would seem to be a safe assumption that farmers can raise mangels for $4 per ton, and thus reduce their feed bill very materially by the judicious use of mangels to replace one-half of the grain ordinarily fed in the ration.

Potting' Butter.

Although the following description of potting butter, from the London Dairy, is of no practical value to our creamery buttermakers, the directions given may be of interest to those of our farm buttermaking readers who still follow the practice of potting a portion of their summer make for winter use.

"Careless methods are always a failure," says the writer, "but when it is properly done butter will keep its best qualities for several months. Success is certain if the following instructions are carefully observed: (1) Properly ripened cream, just of the right acidity, i. e., containing .5 or .6 per cent. lactic acid—if too sweet or too sour the chances are not so good for securing sound-keeping butter. (2) Liberal washing of the butter while in the granular state, in order to free it from casein, is essential. (3) Incorporation of a sufficient quantity of salt to make it keep; the quantity employed is usually 1 oz. of salt per pound of butter, and a thorough working is needed in connnction to get rid of as much water as possible. (4) The butter must be properly consolidated in the vessels in which it is packed, and kept out of contact with the air. Add salt at the rate of 1 oz. to the pound, and partially work the butter; then set it aside for the salt to dissolve, and afterwards re-work until it is well dried.

"Glazed crocks, thoroughly scalded and cooled, are the best receptacles in which to store butter. Use a a butter packer and consolidate well covering the butter on the top with a layer of salt about two inches in thickness, and over the crock stretch parchment or bladder. Sometimes strong brine is poured on the top and renewed every now and again, but dry salt is better. Always store away in a dry room.

"When required for use cut the butter in pieces and place in a churn of water at a temperature of 60 to 65 degrees F., and leave for twenty minutes; then work and make it up. This rids the butter of a lot of the salt, and it should be none the worse for its long storage."

Owner Must Help.

The cow is never any better than her keep. A long pedigree can't make up for short feed; the wedge-shape of body doesn't indicate that we can taper her ration to a fine edge; dairy conformation is no warrant from the cow that her owner shall not perform his part.

The pedigree doesn't make the cow The cow makes her part of, her place in, the pedigree, and she mightily needs the intelligent, liberal help of her owner in the aking.

It is an utter waste of raw material to hang round and discuss the comparative merits of different brands of fertilizers while the manure pile is wasting at home. The manure belongs to the land—be just. —W. F. McSparran.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, **my home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure—**you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourself at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. **I know** that my home treatment is a safe and sure cure for **Leucorrhœa** or **Whitish discharge, Ulceration, Displacement** or **Falling** of the **Womb, Profuse, Scanty** or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths**, also **pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weakness peculiar to our sex.**

I want to send you a **complete 10 days treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost**, my book—"**WOMAN'S OWN MEDICAL ADVISER**" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it and learn **to think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers of Daughters,** I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness, and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really **cures** all women's diseases and makes women well, strong, plump and robust. **Just send me your address**, and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. LIVE STOCK.

Food Units in Swine Feeding.

The high quality of Danish bacon is attributed to two principal causes; —First, the very general use of milk in feeding, and second, the rapid rate at which pigs in Denmark are made to grow. The latter cause in large measure depends upon the first as perhaps no other food is better for the growth of a pig than milk suitably blended with other foods. The Dane has found by experiments and experience that much depends upon proper blending of foods if best results are to be attained. It has been ascertained in an exact degree by repeated experiments, that the diet of a pig should vary according to its age. This is understood and accepted by most feeders in a general sort of way, but the Danes have learned how to vary the diet of a pig throughout the period of its life, so that neither time nor food is lost at any stage of its growth. To this end pigs are grouped according to age into four classes, and the ration is prepared for each group by calculating in food units. Class one includes pigs up to 40 lbs.; class two, 40 to 60 lbs.; class three, 60 to 120 lbs., and class four 120 lbs. to finished weight. Young pigs are given an easily digested diet made up of finely ground chop soaked in milk without either roots or green feed. For pigs of this weight the slop consists of 180 parts by weight of milk to 70 parts by weight of chop.

In food units this diet is 30 per cent. milk and 70 per cent. grain. These percentages are arrived at by the relative food values of the different products. One pound of grain is taken as the basis of a food unit, and as one pound of grain is equal to six pounds of skim milk, it follows that pigs up to forty pounds weight get a mixture consisting of 180 parts by weight of milk and 70 parts by weight of ground grain. This is given in a separate trough as early as the little fellows will eat so that by the time they are weaned at about eight weeks old they are eating so well and have become so accustomed to the food that they continue to grow without a halt.

When a weight of 40 lbs. is reached, the pig is a lusty chap, able to take care of a stronger diet, which includes along with the milk and grain a small percentage of roots or other green food. The diet at from 40 to 60 lbs. consists of 25 per cent. of milk, 70 per cent, of grain and 5 per cent. of green food. That is to say, 5 per cent. of the milk is displaced by an equal per cent. of a succulent vegetable food such as mangels, boiled potatoes, green vetches, clover or alfalfa. The mixture consists of 70 parts by weight of grain, 25 parts by weight of milk, and 40 parts by weight of mangels. The quantity of mangels is arrived at on the basis that 8 lbs. of mangels have a feeding value of one food unit which is equal to one pound of grain. If boiled potatoes are used instead of mangels, only 20 parts by weight are used, because 4 pounds of potatoes, boiled, constitute one food unit or equal to one pound of grain. On the mixture thus compounded, consisting of milk, chop and green food, growing pigs make rapid strides and maintain a vigorous, healthy state.

When sixty pounds are reached, the pig is able to make good use of a little cheaper and more bulky diet, which is so blended as to develop the capacity and vigor of the digestive system. In other words, the machine for turning crops and dairy by-products into meat is by careful feeding brought up to a high standard of efficiency. The diet until the pig doubles its weight of 60 lbs. consists of 15 per cent. roots, 10 per cent. green food and 75 per cent. of grain. This, in a mixture of 245 lbs. would consist of 75 lbs. of grain 90 lbs. of milk and 80 lbs. of roots or alfalfa, etc. It will be observed that the percentage of grain has been fairly constant, while the amount of milk has been decreased and green food correspondingly increased. The pig has now reached 120 lbs. and ready to put onto a finishing ration. He is big for his age, full of vigor, and therefore ready to take care of a fairly strong diet.

From this time on the object is to reach a finished weight in the shortest possible time. Feeding must not, however, be overdone, as the appetite must be kept keen and the digestive organs in strong condition. For this reason both milk and roots are continued but in a much reduced quantity. It is flesh rather than growth that is wanted. The diet therefore now consists of a mixture made up of three-quarters of a food unit (4½ lbs.) of milk, one quarter of one food unit (2 lbs.) of roots for each pig per day mixed with as much grain chop as is eaten with a relish. It is made with water into a rather thick slop, soaked until soft before feeding. By this system of blending foods and feeding, Danish farmers are able to turn off a large proportion of their pigs finished at from five or six months old.)During this time it is true a large amount of grain has been consumed, but it is a very pound has been turned to good account in producing pork.

In the matter of securing economical gains in pork production, the average Danish farmer has outstripped his Canadian rival largely by the adoption of a system of blending foods for pigs of different ages according to their system of calculating food units.

A Profitable Steer.

A bulletin published by the Missouri state board of agriculture describes the points of the profitable steer as follows:

The head should be short and small because it does not contain any valuable flesh and because a short head invariably goes with a short, thick-set body.

The forehead should be full, broad and high so as to show intelligence.

The mouth should be large and the muscles of the jaws well developed, so as to indicate good food grinding apparatus.

The eyes should be full, bright and clear, because this indicates great vitality and vigor, two of the most important qualities.

The neck should be short, thick and set firmly on the shoulders, because this indicates a short-thick-set body and a tendency to lay on flesh.

The shoulders should be compact and well covered with flesh, so as to give smoothness of form and flesh on forequarters.

Strong, straight, and wide-apart forelegs are wanted to give a good foundation for the fore-quarters. Legs should be short because they are not worth much, and anyhow, short legs are stronger than long ones. The chest should be wide, deep and thick through the heart, so as to give plenty of room for the most important organs of the body, namely, the heart and lungs. The brisket should be deep and moderately projecting and breast wide because they go with a well-formed chest.

The girth of the animal should be large, because this indicates a good chest. The crops or that portion just behind the withers, should be full, because this is one of the valuable meat portions.

The back, must be short, straight and broad. Short because a short-backed animal is an early maturing one. Broad so as to give roam for lots of flesh. Straight so as to give good support.

Ribs should be well sprung and arched in order to give plenty of room for the digestive organs. It is a well-founded fact that a large, deep chest and a capacious stomach are good indications than an animal has the capacity to utilize large quantities of food and make rapid progress in fattening. The ribs should be well covered with flesh, because this is a good indication that the animal fattens well.

Wide hips are wanted because wide hips go with broad loin and the loin is the most costly portion of the beef. Loin should be full and thick for the same reason.

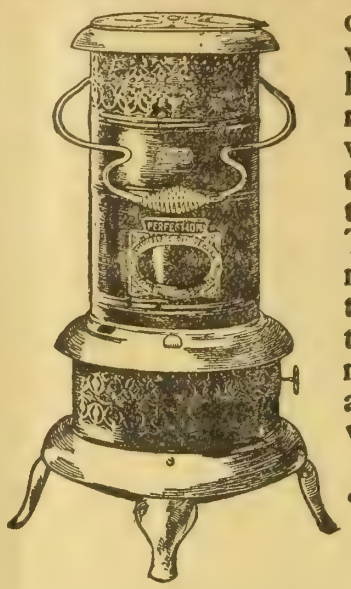
The rump should be long, level and wide, so as to give plenty of room for full and well fleshed, in order to yield plenty of good round steak.

The hind legs should be short and straight, so as to give good foundation for hind quarters. The tail should have a smooth base, fine bone and a fine hair switch. Smooth base so there will be no fear of having lumpy patches of fat gathered there. This is very objectionable, because it spoils the looks of the steer and looks go a long way in affecting the sale of an animal. Fine bone in the tail indicates that the animal is fine boned.

A Hog Model.

A successful hog breeder claims, that the first step toward successful hog raising is having a definite idea of the kind of a hog you are trying to produce. He says the first thing to do is to get clearly in mind what you think constitutes a good hog and what you want to produce. Then find a sow that as nearly as possible

That Cold Room



on the side of the house where winter blasts strike hardest always has a lower temperature than the rest of the house. There are times when it is necessary to raise the temperature quickly or to keep the temperature up for a long period. That can't be done by the regular method of heating without great trouble and overheating the rest of the house. The only reliable method of heating such a room alone by other means is to use a

PERFECTION SMOKELESS OIL HEATER

Absolutely smokeless and odorless

which can be kept at full or low heat for a short or long time.

Four quarts of oil will give a glowing heat for nine hours, without smoke or smell.

An indicator always shows the amount of oil in the font. Filler-cap does not screw on; but is put in like a cork in a bottle, and is attached by a chain and cannot get lost.

An **automatic-locking flame spreader** prevents the wick from being turned high enough to smoke, and is easy to remove and drop back so that it can be cleaned in an instant.

The burner body or gallery cannot become wedged, and can be unscrewed in an instant for rewicking. Finished in japan or nickel, strong, durable, well-made, built for service, and yet light and ornamental. Has a cool handle.

The James Bros. Foundry Co., Perth, Ont.

comes up to your model for a starter Feed judiciously, watch the results of mating keeping in mind at all times what you are trying to produce, and what it would look like if you saw it

This is the description of the Perfect Tecumseh, the most perfect hog I have ever seen: Weight 692 pounds in good breeding condition. Length from between ears to root of tail 65 inches; around body at heart, 67 inches; around body at flank 69 inches; face slightly dished; fairly short head; back slightly arched and broad; sides deep and free from wrinkles; flanks well led down, hams, and shoulders about the same width; good, straight belly line, and well-defined teats; a good, straight leg, set well out under each corner of body; very active in getting around and possessing a quiet disposition.

Now take your tape line and scales and see how many sows you can find that will come up to the above weights and measurements. You will be surprised at how scarce they are, and when you do find one freeze on to her. You will have it well instilled into your mind what that kind of a sow will look like. Perfect Tecumseh was weighed and measured when she was two months in pig, which accounts for her greater body girth than length. I would not select a sow that measured more in girth than in length were she not in pig.

As to the boar it is a common saying that the boar is half the herd. I believe that a good boar is half the herd and a poor one is almost the whole herd, for a poor boar can certainly ruin a herd in a mighty short time. So one should be very careful in the selection of a boar, for he will have a part in the entire herd, and if he is not a good individual and producer the breeder will soon come to grief.—Maine Farmer.

Selecting Breeders.

Those who have been raising hogs for some years probably are well versed in swine wisdom, but by the man who is yet a student, the following from Coleman's Rural World will be appreciated:

In selecting breeding hogs, either male or female, the following points should receive consideration: Form, size for age, quality, and feet and legs.

To thoroughly inspect a hog, it is necessary to view it from the side, front and rear, both standing and in motion. From the side the hog should show a rather short head, full jowl and neck, a strong rather arched back without any depression back of the shoulders or at the loin, a deep, well rounded ham. From front and rear the side lines of the body should be straight and parallel, and this will be true, if the development of shoulder, spring or rib and ham, are uniform.

Good quality is indicated by fine hair, medium bone, absence of wrinkles and general coarseness. Hogs coarse in type mature slowly, and fatten indifferently. Those possessing harsh hair and skin and showing wrinkles will produce inferior pork.

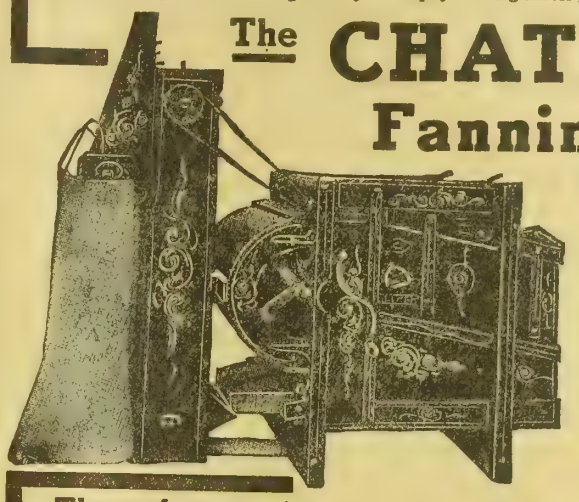
Breeding hogs should have short, strong legs and strong, upright pasterns. Lack of sufficient bone, as shown by weak, broken-down pasterns is a common defect noticeable in brood sows, especially those that have been fed largely on corn. In fact, feed has much to do with development and strength of bone. A low, weak back indicates weakness, and no young sow showing such a defect should be saved for breeding. These two defects—weak pasterns and backs—may be readily noticed when the pig is moved and often when standing. Other common faults are coarse shoulders open on top, poorly sprung, short ribs, and narrow loin.

Clean Your Seed

Separate and grade ALL kinds of seeds—eliminate ALL weed seed, shrunken grains, broken particles and dust. You can do it easily, quickly, thoroughly with the Chatham Fanning Mill and insure

Better, Surer Crops — Highest Market Prices

Don't grow weeds or plant weak seeds. Let us ship you a Chatham immediately, freight prepaid, so you can use it **right away.** You pay nothing unless you are fully satisfied that



The CHATHAM Fanning Mill

actually does all we claim for it. Then you can take 2 years to pay for it, if you want to. Anyway

Dealer in Meat, Poultry, Produce, etc. All consignments carefully attended to and returns are promptly made as soon as goods are sold.

THE HORSE.

How to Train the Horse.

It is much easier to train the young plant or to mould the clay before they are set in some definite form. In the same way the young animal, and notably the horse, has fewer ideas of his own and is more ready to accept the directions of a superior intelligence the younger this work is taken up. The too common notion that education and work are inseparable is largely responsible for the fact that so many foals are allowed to assert their independence until such time as they are fit to go to work, their general usefulness being in most cases impaired on this account. The horse should be reasonably mature before he is called upon to do any service, but any time spent on his education prior to the date at which he first goes into commission, as it were, will be repaid many fold in the more satisfactory manner with which he performs his service, says Dr. Carl W. Gay, an American veterinary surgeon.

Little foals should be taught subordination at the very start, and not allowed to become willful or headstrong. An early effort in this direcetion will not only simplify that culmination of their education, too, often most properly termed "breaking," but it will insure that end being more completely accomplished. On the other hand, the idea of fear must be kept remote as possible, as the timid horse is usually the one which has some terrifying experience to remember. Even before time for haltering arrives the youngsters may be taught to stand over, have their feet raised and in a general way to respond to the master mind.

When halters are to be placed on the colts in order that they may become accustomed to them, one of the light web variety is preferable to the heavier strap halter commonly used, and care should be taken not to pull heavily on the nose band at any time. Many deformed face lines have been caused by this means. It is not necessary to drag a colt by the halter in order to suggest to him that his business is to follow. As a matter of fact, the reverse effect is usual, and the harder a colt is pulled the harder he pulls back. If, on the contrary, he is coaxed along some accustomed route, as to the water trough and back, he will soon catch on and follow promptly whenever the halter is taken in hand.

The first step toward getting a colt going successfully in harness is to bit and mouth him properly. In the old countries a common practice is to back the colt into a slip stall and hold him there by cross ties snapped in the bit rings. He thus works against the iron, first bearing then yielding, until he becomes accustomed to its presence and the pressure exerted by it. The dumb jockey or more simple bitting rig, commonly used serves much the same purpose, but no mechanical device is as effective as the pressure of the hand on the rein; better mouths are made in this way. Inasmuch as the conveyance of the master's thought to the horse's mind for execution is via hands, reins, bit and mouth, no progress can be made and none should be attempted until this funddamental means of communication has been established. Simple physical power is a poor means of control when applied to the horse. On the contrary, control is a matter which involves to a greater extent the mental faculties of both horse and master. If he has been inspired from colthood with the idea of man's dominance, obedience will receive a great deal more consideration from him than rebellion will.

HORSEMEN ATTENTION!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. They cure Cough, Cold, Distemper, Colic, Glanders, Spavin, Pink eye and all diseases of the Horse.

TRURO, N. S.

Dear Sirs,—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse liniment. The cough was of twelve months standing. In my large expeience with horses, I consider this liniment to be the best made for all diseases of the horse, and I recommend it to my friends.
E. J. ANDERSON.

BEAR RIVER, N. S.

DEAR SIRS,—
We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it.
Yours truly,
CLARKE BROS.

While teaching the horse subordination by leading him to underestimate certain of his powers, it is also essential that he be made to believe that there is no limit to certain others. For instance the first time the colt is tied up by the head, see to it that the halter will hold him in case he pulls. If he does and he fails in the first few attempts, a string will probably serve as well as a chain to keep him in his place thereafter, while if he succeeds in freeing himself at the first few attempts, he will never cease trying to repaeat what he has once accomplished. In the breaking process the kick strap should not be left off until the habit of quietness has been acquired, nor should any pains be spared to prevent an initial performance at either rearing, backing, wheeling or running. On the other hand, it is just as important not to overload a pair of draft colts with a view of creating in them the notion that they can pull anything with two ends loose. For the same reason a prospective racehorse should be given no occasion to believe that he is any thing but invincible. Thus by exaggerating our equine servant's notion of those of his powers which are most useful to us and at the same time deceiving him as to those attributes which, if realized, might impair his usefulness, we promote his serviceability.

The superiority of brain over brawn as concerned with the control of horses is well demonstrated in the admirable performance which occasionally good women drivers can get from horses which were unmanageable to most men. A light hand and a steady nerve are the requisites. The word like the whip, should be well chosen, as to kind and time of application, and used with a definite meaning, but the fewer the better.

It is not necessary here to discuss the various systems of breaking nor the art of driving. The idea is simply to impress upon the breeder the importance of properly handling the colts and fillies which he has bred. At all events give them a liberal education and begin early. Then when the buyer comes along the colt so handled is more likely to sell well for three reasons—i. e., he is worth more; the owner has a better opportunity to show the colt off to his own advantage, presenting him with the best foot forward, as it were, and the buyer has a much better chance to observe the real merit that he possess.

Teaching Horses to Stand.

A team or a single horse that will stand perfectly still until asked to move forward, is about as sure a test of the kind of a horseman the driver is as can be found, writes J. W. Sangster in Canadian Farm. How often do we see some spirited horse stamping around, backing up and then straining on the reins while its driver is alternately jerking at the reins and endeavoring to get the rug around his knees or assisting some woman perhaps to get comfortably seated?

There is a time when this matter can be remedied. It is when the horse is receiving his first lessons. He should be taught to stand absolutely still at all times, until he receives the word of command to move on. Moderately still will not do. It must be emphasized in the horse's mind that he must not move. If this is once done, and it takes a good many lessons to do it, the matter is practically settled. The horse's one stock in trade is his memory, and he will fterward stand still, so that the driver can make all preparations in comfort.

Perhaps there is no other thing which has done more to make nervous women apprehensive of horses than a few experiences with those that would not stand still while the driver was getting ready. A horse which dances around at that time exhibits little appearance of being under control of the driver. As a matter of fact he isn't to the same extent as if he were trained to stand.

The Horse's Feet.

Your hotses that have been out to pasture all summer will come in with feet apparently grown out of shape, but in reality only trying to undo what your blacksmith has done and get back into normal condition. Don't send the hired man or a boy to the shop with these horses but go yourself, and when there keep your eyes open and see that the shoer does no unnecessary cutting of horn at the heel and keeps his knife off the frog and sole altogether. The frog is intended by nature to act as an elastic buffer to the foot, and to help in preserving the limb from the injurious effects of concussion, and the larger and more prominent it is, the better does it fulfill this function.

Studying the Horse.

Almost any person who is a student of the horse, if asked for a rule by which to judge the value of a horse by his conformation, will tell you that long muscles indicate speed and short muscles power or strength. That is, that long muscles enable a horse to get over the ground rapidly. Short muscles, however, are not powerful because they are short, but because in horses constructed on that plan the muscles are thicker and contain more fibers, all of which pulling together when contracted, exert a much greater pulling force than long, more slender muscles.

Horse Notes.

Proper grooming, feeding and driving is all a horse needs to make him the noblest brute on earth; therefore, be generous in the use of the comb and brush, especially the brush. In using a currycomb, see that the teeth are not bent. Such a comb is an instrument of torture. Teach the boys to use it gently, as many horses are given ugly tempers by cruel and careless currying. To hurt a horse will cause him to hate the operator.

O. M. Mo Moore of So. Strong has rigged out his heavy work team with harness arranged in such a manner that it can be placed on the horses by simply pulling a rope, a la fire department method. In addition he has the horses trained to leave their stalls on the tap of a bell, rungby a push button from the house. By this means the horses are always in waiting for their master when he approaches. This is not the work of a man who is farming for the dollars, but he is as the Boston Post says, "just showing the farmers how to raise things," after a long service as editor-printer in various States.

The very best horses will never bring their worth on any market unless in good flesh. It is a losing policy to send a thin horse to the market.

That's the only way you can afford to keep them, because any lameness means less work and less profit to you.

Spavin, Splint, Curb, Sweeney, Ringbone, Swelling or Lameness need not prevent your horses from working. Simply use Kendall's Spavin Cure.

It works while the horse works—takes away the pain—reduces swellings—makes legs and joints sound and strong—leaves no scars or white hairs because it does not blister.

Kendall's
Spavin Cure

has been the horseman's standby for 40 years and is used all over the world.

Burns, Ont. Sept. 10th 1909.
"I have used Kendall's Spavin Cure and it cures Old Stubborn Cases."
WILLIAM H. DOUD.

Keep your horses sound as a dollar. Get Kendall's today and you will have it tomorrow if needed. $1 a bottle—6 for $5.

POULTRY.

Keeping Records of Poultry.

Editor Maritime Farmer:—

The question is often asked if poultry keeping pays. There is at the present time a greater demand for poultry and poultry products than has been for many years past, in fact the demand was never greater than at present.

Several large dealers of meats and poultry products in Montreal have been trying to buy poultry and eggs in the Maritime Provinces during the past year. The prices they offered were good, and only a small quantity could be purchased. The city of Montreal last year imported 6000 dozen of eggs from Russia, and at present cannot get enough to supply the demand. A splendid opportunity is open to the farmers of the Maritime Provinces to secure this market or at least a portion of it. It is not necessary to make any elaborate preparations, or to erect expensive buildings to keep some poultry. Every farm has a small out building which could be fitted up to accommodate a flock of about fifty fowls. An accurate record should be kept of all feed consumed and of eggs received.

During the past year the Poultry Department at the Agricultural College, Truro, N. S., has furnished to farmers and poultrymen, blank sheets on which to keep these records. They were forwarded monthly, and when filled in were returned to the College. These records were kept by a number of persons in different parts of the Maritime Provinces, and show after all feed has been paid for, from the product of the fowls, a balance in their favor, of from 50c to $1.10 per hen for the year. In some cases persons who started these records, found out that their fowls were unprofitable, or that they had been following an unprofitable system of feeding, and were not long in getting rid of old and unprofitable fowls and adopting a better system of feeding them.

The object of starting these records was not to test breed against breed, but to induce persons keeping poultry to find out for themselves the profitable fowls, and to get an estimate of the cost of keeping poultry in different parts of the Maritime Provinces.

The manager of the Poultry Department at the Agricultural College, would like to hear from all persons who have flocks of from fifteen to fifty pullets which they purpose keeping during the winter, in order that records may be forwarded and conditions explained re-keeping the record sheets.— J. P. Landry, Poultry Manager, Agricultural College Farm, Truro, N. S.

BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

Blackhead in Turkeys.

The experiment station at Kingston, R. I., has for some time been conducting an investigation of blackhead in turkeys, and has just published Bulletin 141, giving an abstract of a technical bulletin on the same subject. The investigations were carried on in co-operation with the bureau of animal industry of the United States department of agriculture, which was also published on the same date.

After reviewing the decline of turkey production in New England, and especially in Rhode Island, the writers, Leon J. Cole, Philip B. Hadley and W. F. Kirkpatrick, discuss the malady at considerable length. They say that the invariable symptoms are: First, diarrhea at some stages of the disease; second, a condition of increasing languor or stupor, together with isolation from companions in the flock; and third, loss of appetite and more or less prolonged emaciation. The name blackhead is a partial misnomer, since the discoloration is by no means constant, and, on the other hand, may occur in cases where blackhead is not present.

The bulletin does not recommend treatment of the disease. In the long run the poultryman will do better to practice methods of prevention rather than waste his money on so-called remedies and cures. Methods of treating poultry diseases do not at present rest upon very secure foundations, and furthermore, even if certain measures for treatment are known to be effective the average poultryman does not have time to undertake treating his birds. It may therefore be said that the treatment should be limited to birds.

The preventive measures recommended are: 1. To protect infested yards and flocks by carefully examining all new stock, whether turkeys, fowls, geese or other domestic birds. 2. To keep the turkeys on grounds as fresh as can be obtained, that is, to change the range at least every two years and every year if possible, and above all to keep the turkeys isolated from other poultry.

3. To keep every turkey in the flock under frequent observation, in order to separate and at once isolate any bird which may give evidence of illness. To facilitate such observations it is of the greatest help to leg-band every bird and to record the weight from time to time. While this may appear difficult and impracticable, as a matter of fact it is neither, but can be done easily and in a short time. If the poultryman expects to meet success in raising birds he must give the turkeys at least a fraction of the thought and attention that he gives to other departments of his farm work. The course outlined makes it possible to learn whether any birds are losing weight, and if this is the case, these birds should be separated until suspicion can be allayed. It is especially dangerous to allow a turkey hen showing signs of disease to brood her young.

4. The yard should be kept as free as possible from English sparrows and the poultry houses and grain bins free from rats, since these creatures are accused of spreading the disease. 5. If it is desired to fatten birds for market, increase of ration should begin gradually. It is never safe to fatten birds which in successive weighings show losses of weight Overfeeding does not cause blackhead, but it frequently causes the sudden death of birds in which blackhead is present. 6. When birds have died of blackhead their bodies should be promptly burned or buried.

All that the bulletin recommends concerning remedial measures is: To isolate the sick bird in a dry, well-ventilated location free from cold and drafts, and to feed sparingly on soft, light, easily assimilable food, with little grain, especially corn.

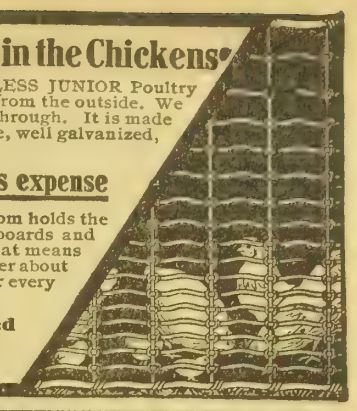
Keeps out large Animals—Keeps in the Chickens

We've put strength and stiffness into the PEERLESS JUNIOR Poultry Fence so it can stand the attacks of restless animals from the outside. We have made it close enough so small fowl cannot get through. It is made of much heavier wire than the ordinary poultry fence, well galvanized, therefore much more durable.

Peerless Junior the fence that saves expense

That heavy, No. 9, hard steel wire at top and bottom holds the fence taut and true without the necessity of fence boards and saving more than half the usual number of posts. That means considerable saving to you. Write for our printed matter about PEERLESS Fences. We make fences and gates for every purpose.

BANWELL HOXIE WIRE FENCE CO., Limited
Hamilton, Ont.
Dept. K Winnipeg, Man.



Clean Water for Fowls.

Since I began to keep an account with my fowls I have found that the profit depends largely upon how closely one watches the expenses. There are many drinking fountains on the market which are convenient and will keep the water clean, but they are an item of considerable expense when one raises many hens.

It is an easy matter to make good fountains for chicks, but with grown fowl, until lately I have found most impossible to keep them from scratching more or less litter into the water.

Recently I hit upon a device which fills the bill entirely. I buy my kerosene in five gallon cans. When a can is empty I cut it in two lengthwise, making two drinking vessels. A cover is made for each drinking can by taking a piece of board an inch longer and an inch wider than the can and nailing a small piece of pine on at each corner, so that the four pieces serve as legs, making it look like a small table. Boring holes in the board to hold the ends of the legs takes little more time, but makes a better job. These legs are nailed on so that one stands in each corner of the can. They are long enough to hold the board up two inches above the edge of the can. This prevents the fowls from getting into the water, but allows them to put their heads in under the board to drink.

When I first began making this drinking vessel I set it on the floor of the hen house. The hens scratched litter and dirt into it, but I have found a very convenient way of preventing this. I take a board as wide as the can and a foot longer and fasten it like a shelf on the side of the hen house, just high enough so that a hen can conveniently jump up to it from the floor. When a hen is thirsty she jumps upon the shelf which projects beyond the can, drinks and jumps down again without getting any dirt into the water as she cannot get into it nor scratch anything into it.—By W. I. Thomas, Crossfield, Alta., in N. W. Farmer.

Goose Growing is Simple.

I have been raising geese the last 15 years; only one breed, the Embden. I prefer this because of its hardiness, size, docility and color. The feathers sell here for 5 cents above the market price for others. I like to have the goslings hatch in April or earlier. This avoids the hot weather.

Hens used for hatching. Each is given six eggs, or if she be large perhaps seven. The old goose is made to lay again, but allowed to sit on the second cluch of eggs. I think geese better mothers than hens. They are more solicitous, can care for a greater number, and the gander will also assist his mate. When time is almost up for hatching I put the eggs in lukewarm water and all containing live goslings will turn. I think the water softens the shell and causes a better hatch.

Eggs from the first year's laying are usually not so fertile as later eggs. They are also fewer in number, and produce weaker goslings. Geese do not fail in egg production like hens, but may be kept for years. If ganders are kept longer than the third year they usually become so cross they cannot be allowed to run with other fowls.

I keep the young in a small inclosure till they can walk without turning on their backs. Then let them have the run of a good pasture. They get plenty of water, but it is not necessary that they bathe, better not. I never leave them out in heavy rains, for they will open their mouths and drink enough water to drown.

As soon as fully feathereh, in three or four months, they are ready to pick, and may be picked every eight weeks. After the fall picking I begin to feed grain. When fully feathered they will be ready for market. If they can have free access to a plot of corn they will not allow any of it to go to waste, and will save trouble of feeding.—I. H. N.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Pigs is Pigs.

Mike Flannery, the Westcote agent of the Interurban Express Company, leaned over the counter of the express office and shook his fist. Mr. Morehouse, angry and red, stood on the other side of the counter, trembling with rage. The argument had been long and heated, and at last Mr. Morehouse had talked himself speechless. The cause of the trouble stood on the counter between the two men. It was a soap box across the top of which were nailed a number of strips, forming a rough but Guinea-pigs were greedily eating letguinea-pigs were greedily eating lettuce leaves.

"Do as you loike, then!" shouted Flannery, "pay for thim an' take thim, or don't pay for thim and leave thim be. Rules is rules, Mister Morehouse, an' Mike Flannert's not goin' to be called down fer breakin' of thim."

"But, you everlastingly stupid idiot!" shouted Mr. Morehouse, madly shaking a flimsy printed book beneath the agent's nose, "can't you read it here—in your own plain printed rates? 'Pets, domestic, Franklin to Westcote, if properly boxed, twenty-five cents each.'" He threw the book on the counter in disgust. "What more do you want? Aren't they pets? Aren't they domestic? Aren't they properly boxed? What?

He turned and walked back and forth rapidly; frowning ferociously.

Suddenly he turned to Flannery, and forcing his voice to an artificial calmness spoke slowly but with intense sarcasm.

"Pets," he said "P-e-t-s! Twenty-five cents each. There are two of them. One! Two! Two times twenty-five are fifty! Can you understand that? I offer you fifty cents."

Flannery reached for the book. He ran his hand through the pgges and stopped at page sixty four.

"An' I don't take fifty cints," he whispered in mockery. "Here's the rule for ut. 'Whin the agint be in anny doubt regardin' which of two rates applies to a shipment, he shall charge the larger. The consign-ey may file a claim for the overcharge.' In this case, Mister Morehouse, I be in doubt. Pets thim animals may be, an' domestic they be, but pigs I'm blame sure they do be, an' me rules says plain as the nose on yer face, "Pigs Franklin to Westcote, thirty cints each.' An' Mister Morehouse, by me arithmetical knowledge two times thurty comes to sixty cints."

Mr. Morehouse shook his head savagely. "Nonsense!", he shouted, "confounded nonsense, I tell you! Why, you poor ignorant foreigner, that rule means common pigs, domestic pigs, not guinea-pigs!'i

Flannery was stubborn.

"Pigs is pigs," he declared firmly. "Guinea-pigs, or dago pigs or Irish pigs is all the same to the Interurban Express Company an' to Mike Flannery. Th' nationality of the pig creates no differentiality in the rate, Misther Morehouse! 'Twould be the same was they Dutch pigs or Rooshun pigs. Mike Flannery," he added, "is here to tind to the expriss business and not to hould conversation wid dago pigs in sivintéen languages fer to discover be they Chinese or Tipperary by birth an' nativity."

Mr. Morehouse hesitated. He bit his lip and then flung out his arms wildly.

"Very well!" he shouted, "you shall hear of this! Your president shall hear of this! It is an outrage! I have offered you fifty cents. You refuse it! Keep the pigs until you are ready to take the fifty cents, but, by George, sir, if one hair of those pigs' heads is harmed I will have the law on you !"

He turned and stalked out, slamming the door. Flannery carefully lifted the soap box from the counter and placed it in a corner. He was not worried. He felt the peace that comes to a faithful servant who has done his duty and done it well.

Mr. Morehouse went home raging. His boy, who had been awaiting the guinea-pigs, knew better than to ask him for them. He was a normal boy and therefore always had a guilty conscience when his father was angry. So the boy slipped quietly around the house. There is nothing so soothing to a guilty conscience as to be out of the path of the avenger.

Mr. Morehouse stormed into the the house. "Where's the ink?" he shouted at his wife as soon as his foot was across the doorsill.

Mrs. Morehouse jumped guiltily. She never used ink. She had not seen the ink, nor moved the ink, nor thought of the ink, but her husband's tone convicted her of the guilt of having borne and reared a boy, and she knew that whenever her husband wanted anything in a loud voice the boy had been at it.

"I'll find Sammy," she said meekly.

When the ink was found Mr. Morehouse wrote rapidly, and he read the completed letter and smiled a triumphant smile.

"That will settle that crazy Irishman!" he exclaimed. "When they get that letter he will hunt another job, all right!"

A week later Mr. Morehouse received a long official envelope with the card of the Interurban Express Company in the upper left corner. He tore it open eagerly and drew out a sheet of paper. At the top it bore the number A6754. The letter was short. "Subject—Rate on guinea-pigs," it said, "Dr. Sir—We are in receipt of your letter regarding rate on guinea-pigs between Franklin and Westcote, addressed to the president of this company. All claims for overcharge should be addressed to the Claims Department."

Mr. Morehouse wrote to the Claims Department. He wrote six pages of choice sarcasm, vituperation and argument, and sent them to the Claims Department.

A few weeks later he received a reply from the Claims Department. Attached to it was his last letter.

"Dr. Sir," said the reply. "Your letter of the 16th inst., addressed to this Department, subject rate on guinea-pigs from Franklin to Westcote, rec'd. We have taken up the matter with our agent at Westcote, and his reply is attached herewith. He informs us that you refused to receive the consignment or to pay the charges. You have therefore no claim against this company, and your letter regarding the proper rate on the consignment should be addressed to our Tariff Department."

Mr. Morehouse wrote to the Tariff Department. He stated his case clearly, and gave his arguments in full, quoting a page or two from the encyclopedia to prove that guinea-pigs were not common pigs.

With the care that characterizes corporations when they are systematically conducted, Mr. Morehouse's letter was numbered, O. K'd, and started through the regular channels. Duplicate copies of the bill of lading, manifest, Flannery's receipt for the package and several other pertinent papers were pinned to the letter, and they were passed to the head of the Tariff Department.

The head of the Tariff Department put his feet on his desk and yawned. He looked through the papers carelessly.

"Miss Kane," he said to his stenographer, "take this letter. 'Agent Westcote, N. J. Please advise why consignment referred to in attached papers was refused domestic pet rates."

Miss Kane made a series of curves and angles on her note book and waited with pencil poised. The head of the department looked at the papers again.

"Huh! guinea-pigs!" he said. "Probably starved to death by this time! Add this to that letter: 'Give condition of consignment at present.'"

He tossed the papers on the stenographer's desk, took his feet from his own desk and went out to lunch.

When Mike Flannery received the letter he scratched his head.

"Give prisint condition," he repeated thoughtfully. "Now what do thim clerks be wantin' to know, I wonder! 'Prisint condition, 'is ut? Thim pigs, praise St. Patrick, do be in good health, so far as I know, but I niver was no veterinairy surgeon to dago pigs. Mebby thim thim clerks wants me to call in the pig docther an' have their pulses took. Wan thing I do know, howiver, which is they've glorious appytites for pigs of their soize. Ate? They'd ate the brass padlocks off of a barn door! If the paddy pig, by the same token, ate as hearty as these dago pigs do, there'd be a famine in Ireland."

To assure himself that his report would be up to date, Flannery went to the rear of the office and looked into the cage. The pigs had been transferred to a larger box—a dry goods box.

"Wan, —twa, —t'ree, — four, — foive, —six, —sivin, —eight!" he counted. "Sivin spatted an' wan all black. All well an' hearty an' all eatin' loike ragin' hippypottymusses." He went back to his desk and wrote.

"Mr. Morgan, Head of Tariff Department," he wrote. "Why do I say dago pigs is pigs because they is pigs and will be til you say they ain't which is what the rule book says stop your jollying me you know it as well as I do. As to health they are all well and hoping you are the same. P. S. There are eight now the family increased all good eaters. P. S. I paid out so far two dollars for cabbage which they like shall I put in bill for same what?"

Morgan, head of the Tariff Department, when he received this letter, laughed. He read it again and became serious.

"By George!" he said, "Flannery is right, 'pigs is pigs.' I'll have to get authority on this thing. Meanwhile, Miss Kane, take this letter: Agent, Westcote, N. J. Regarding shipment guinea-pigs, File No. A6754 Rule 83, General Instruction to Agents, clearly states that agents shall collect from consignee all costs

OWES HER LIFE TO

Lydia E. Pinkham's Vegetable Compound

Vienna, W. Va. — "I feel that I owe the last ten years of my life to Lydia E. Pinkham's Vegetable Compound Eleven years ago I was a walking shadow. I had been under the doctor's care but got no relief. My husband persuaded me to try Lydia E. Pinkham's Vegetable Compound and it worked like a charm. It relieved all my pains and misery. I advise all suffering women to take Lydia E. Pinkham's Vegetable Compound." — MRS. EMMA WHEATON, Vienna, W. Va.

Lydia E. Pinkham's Vegetable Compound, made from native roots and herbs, contains no narcotics or harmful drugs, and to-day holds the record for the largest number of actual cures of female diseases of any similar medicine in the country, and thousands of voluntary testimonials are on file in the Pinkham laboratory at Lynn, Mass., from women who have been cured from almost every form of female complaints, inflammation, ulceration, displacements, fibroid tumors, irregularities, periodic pains, backache, indigestion and nervous prostration. Every such suffering woman owes it to herself to give Lydia E. Pinkham's Vegetable Compound a trial.

If you would like special advice about your case write a confidential letter to Mrs. Pinkham, at Lynn, Mass. Her advice is free, and always helpful.

15,000 Canadian Poultrymen Have Doubled Their Profits By

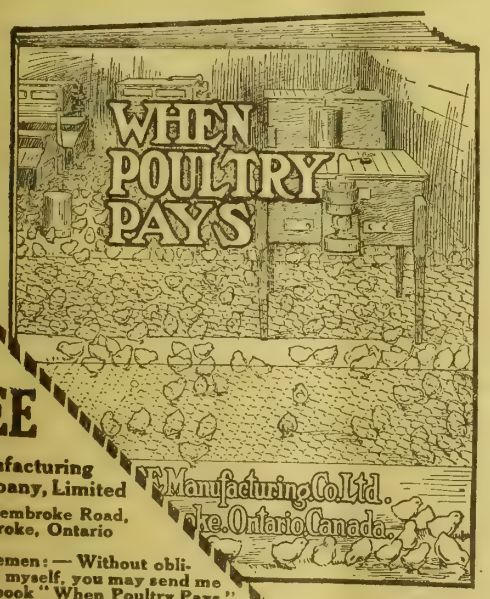
THE PEERLESS WAY

What these poultrymen have done you can do—no matter in what part of Canada you live; you can raise the crop that never fails—the crop that knows no bad years! If you have never kept poultry do not let that deter you; you will have fewer formed habits to overcome and will be ready to let The Peerless Way lead you to success. Or if you have been keeping poultry in a haphazard way, The Peerless Way will show you how to systematize your enterprise into a real money-maker. Even if you have made a failure of poultry-raising—even though you be discouraged—disinclined ever to consider poultry-raising again—investigate The Peerless Way for yourself and study the guarantee that it has to offer you; for, let us say this, whether you are simply a beginner, whether poultry forms only an incidental part of your farm work, whether you are already in poultry-raising as a business, The Peerless Way affords you a real way to increase the profits. Consider this very carefully. Then read every word of what follows and send for our big FREE book entitled "When Poultry Pays."

FREE This Book With The Complete Story Of The Peerless Way

Simply fill out the coupon and send it to us. Then when you get the book, read it at least twice. You will find it packed full of facts about raising poultry for profit. There is no clever writing nor empty theory about the book, "When Poultry Pays"; but it certainly does clear up a whole host of problems that have long and often puzzled practical poultrymen. Let this book put its plain, terse facts before you—let it tell you **why** and **how** you can put The Peerless Way to work to make money for you. Do not put it off—there is no time like the present for increasing your knowledge.

Send Us The Coupon



LEE
Manufacturing Company, Limited
104 Pembroke Road, Pembroke, Ontario

Gentlemen:—Without obligating myself, you may send me your book "When Poultry Pays," and the proof of how The Peerless Way has successfully co-operated with others.

Name.....

Address.....

Town.....

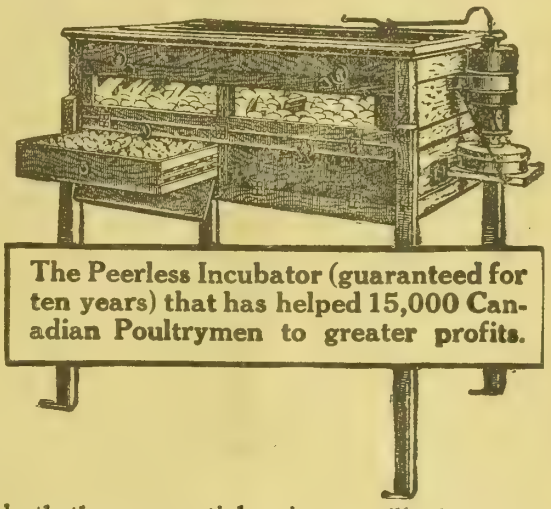
Province.....

Knowledge Is More Essential Than Money

Very little money will start you right in profitable poultry-raising—if you know how to go about the business. And The Peerless Way will show you exactly what you have to do and how you have to do it to make money. The Peerless Way is more than merely a system for raising poultry; it is a system for raising **at a profit!** The knowledge that The Peerless Way offers you is so explicit that a child could not misunderstand it—it explains everything—and if, beyond that, some unusual problem does arise, our Poultry Advisory Board is at your service without charge to consider your case individually and to write you personally.

Poultry Raising is the Profitable Branch of Agriculture

Given the same care, time and attention as any other branch of agricultural work, there is no department that can be made to yield such handsome returns on small investment. We know this—15,000 Canadian poultrymen, working with our co-operation, have proven it for us. But it is one thing merely to "keep poultry" and quite another to get every last cent of profit out of the work. The profits are in the knowledge you possess—knowledge of how to proceed, in the first place, and after that, knowledge of **how to market your output.** The Peerless Way will guide you on both these essential points—will show you what to do and how to do it—and then, through our co-operative marketing plan, will take care of all the eggs and poultry you can produce and at highest market prices. When you get our book, read the letters we have printed in it from hundreds of followers of The Peerless Way in every part of the Dominion—letters from practical poultrymen who have never been able to do by any method what they have done by The Peerless Way. Get the book—just send the coupon—that brings it.



The Peerless Incubator (guaranteed for ten years) that has helped 15,000 Canadian Poultrymen to greater profits.

Let Us Show You How To Market—Right

Let us explain what we mean by Co-Operative Marketing—let us tell you about the method that has been proven by 15,000 poultrymen who command higher prices than the old way of selling poultry and eggs could ever have given them. Let us explain to you how to get all the profits that rightfully belong to you. Write us for further information about this proof of successful poultry-raising; let us tell you how it has been worked out, how it has been tested, and how it has been proven; let us tell you why it is the only way that successfully meets Canadian climatic conditions—why there is no farm in Canada on which poultry would not pay better than any other crop—why our methods are so simple and yet so practical, that a schoolboy could not fail with them—why you could not find a better investment for either part or all of your time. Send for the book.

SIXTEEN MONTHS ON CRUTCHES!

NOW COMPLETELY CURED

PERTH, N.B.

"I am writing this to let you and sufferers from Rheumatism know of the wonderful benefits I have derived from GIN PILLS. For two years, I was an invalid, incapable of work of any kind. For sixteen months, I was unable to move without the assistance of a crutch and cane. I was treated by our best doctors as well as taking treatment from a specialist in Chicago. I did not improve and had about given up hope of ever being well again when a friend advised me to try GIN PILLS. This I did, and with a two months treatment was a well man again. This was four years ago and I have had no return of my trouble since.

I still use a box or two of GIN PILLS a year, just as a preventative and am enabled to go fishing and shooting in the spring and fall, and lie out on the ground at night, without any inconvenience.

GIN PILLS are a wonderful medicine and I take great pleasure in recommending GIN PILLS to all sufferers from Rheumatism, for I have no doubt that if they will persist in the treatment, GIN PILLS will do for them what they have done for me".

ALEX. W. STEVENSON.

GIN PILLS are sold by all dealers at 50c. a box—6 for $2.50. Sample free if you write us. National Drug and Chemical Co. Dept. M. F. Toronto.

National Lazy Liver Pills are just what you need if the bowels are "tight" or the liver torpid. They act gently but surely. 25c. a box. 65

of provender, etc., etc., required for live stock while in transit or storage. You will proceed to collect same from cansignee."

Flannery received this letter next morning, and when he read it he grinned.

"Proceed to collect," he said softly. "How thim clerks do loike to be talkin'! Me proceed to collect two dollars and twinty-foive cints off Misther Morehouse! I wonder do thim clerks know Misther Morehouse? I'll git it! Oh, yes! 'Mis-

ther Morehouse, two an' a quarter, plaze.' 'Cert'nly, me dear friend F'annery. Delighted!' Not!"

Flannery drove the express waggon to Mr. Morehouse's door. Mr. Morehouse answered the bell.

"Ah, ha!" he cried as soon as he saw it was Flannery. "So yau've come to your senses at last, have you? I thought you would! Bring the box in."

"I hev no box," said Flannery coldly. "I hev a bill agin Misther John C. Morehouse for two dollars and twinty-foive cints for kebbages aten by his dago pigs. Wud you wish to pay ut?"

"Pay— Cabbages— !" grasped Mr. Morehouse. "Do you mean to say that two little guinea-pigs-"

"Eight!" said Flannery. "Papa an' mamma an' the six cnilder. Eight!"

For answer Mr. Morehouse slammed the door in Flannery's face. Flannery looked at the door reproachfully.

"I take ut the con-sign-y don't want to pay for thim kebbages," he said. "If I know signs of refusal, the con-sign-y refuses to pay for wan dang kebbage leaf an' be hanged to me!"

Mr. Morgan, the head of the Tariff Department, consulted the president of the Interurban Express Company, regarding guinea-pigs as to whether they were pigs or not pigs. The president was inclined to treat the matter lightly.

"What is the rate on pigs and on pets?" he asked.

"Pigs thirty cents, pets twenty-five," said Morgan.

"Then of course guinea-pigs are pigs," said the president.

"Yes," agreed Morgan, "I look at it that way, too. A thing that can come under two rates is naturally due to be classed as the higher. But are guinea-pigs, pigs? Aren't they rabbits?"

"Come to think of it," said the president, "I believe they are more like rabbits. Sort of half-way station between pig and rabbit. I think the question is this— are guinea-pigs of the domestic pig family? I'll ask professor Gordon. He is authority on such things. Leave the papers with me."

The president put the papers on his desk and wrote a letter to Professor Gordon. Unfortunately the Professor was in South America collecting zoological specimens, and the letter was forwarded to him by his wife. As the Professor was in the highest Andes, where no white man had ever penetrated, the letter was many months in reaching him. The president forgot the guinea-pigs, Morgan forgot them, Mr. Morehouse forgot them but Flannery did not. One-half of his time he gave to the duties of his agency; the other half was devoted to the guinea-pigs. Long before Professor Gordon received the president's letter Morgan received one from Flannery.

"About them dago pigs," it said, "what shall I do they are great in family life, no race suicide for them, there are thirty-two now shall I sell them, do you take this express office for a menagerie, answer quick?"

Morgan reached for a telegrgph blank and wrote:

"Agent, Westcote. Don't sell pigs."

He then wrote Flannery a letter calling his attention to the fact that the pigs were not the property of the company but were merely being held during a settlement of a dispute regarding rates. He advised Flannery to take the best possible care of them.

Flannery, letter in hand, looked at the pigs and sighed. The dry-goods box cage had become too small. He boarded up twenty feet of the rear of the express office to make a large and airy home for them, and went about his business. He work ed with feverish intensity when out on his rounds, for the

150 Favorite Old-Time Songs

With Words and Music Complete for

15 Cents

This is a splendid collection of old-time songs and ballads —songs that touch the heart and recall the tenderest memories, many of them having been popular favorites for forty or fifty years and just as dearly loved to-day as when they were written. Each song is published in this book with both words and music complete and we question if there has ever been issued a book containing so large a collection of sterling favorites at so low a price. We will send this book postpaid to any address on receipt of 15 cents.

REMARKABLE OFFER

We issue a special line of popular priced novels by such famous authors as Conan Doyle Mrs. Southworth, "The Duchess," Alexander Dumas, etc., etc. Send us fifty cents for a tris order of a dozen books and we will include the Song Book free of charge. This offer is for a limited time only. Address all orders:

The Wholesale Book Co., Dept. 11, Winnipeg, Can.

An Encouraging Message

I have a message of hope and good cheer, of encouragement and inspiration to every suffering woman. I have endured the torture due to female troubles and the consequent despondency and mental agony almost to the point of despair, and I have been restored from this condition to a state of vigorous health, and to the happy, exhilarating frame of mind which accompanies physical well being. This change has been brought about wholly by the use of ORANGE LILY.

In addition I have had the privilege and pleasure of inducing multitudes of other suffering women to give ORANGE LILY a trial, and have received thousands of enthusiastic acknowledgments of the blessings it has brought to them. The following is a sample:

Truro, N. S., April 5, 1909.

Dear Mrs. Currah,—Your very kind letter was received yesterday. In reply to your question about my health, I am thankful to say that I am very well. As I have never given you a statement of my case you may be interested in it.

For several years I have suffered untold agony. This suffering was continuous, but I would have violent attacks every few weeks, each attack lasting several days. The first Sunday in November, I felt the pain increasing and so did not go to prayers. The rest of the family did go, and soon after the forcing down pains seized me and I had to remain on the floor until their return. I was in great pain all night and was very sick for a whole week.

Then Mrs. L. came to see me and told me of your wonderful medicine. I got my husband to send for it right away, as I was too sick to write myself. (My doctor could do nothing for me.) I have used 5 boxes of ORANGE LILY, have had three months of good rest, and am now well, never better in my life. I have not had the old pains since. I often ask my husband if it is myself that is going around and doing my own work. I can scarcely believe it. It brings tears of joy to my eyes. I could shout it to all the world. I cannot speak enough in its praise.

Your friend, MRS. E. H. F.

Receiving, as I do, dozens of such reports each day, I feel impelled to make known to my suffering sisters the merits of ORANGE LILY. It differs from other so-called remedies in that it is not taken internally. It is a strictly local treatment, and is applied directly to the affected organs. Its curative elements are absorbed into the congested tissues, expelling the stagnant foreign matter which has been irritating the membrane and oppressing the nerves, and a growing feeling of physical and mental relief is noticeable almost from the start. It is a positive, scientific remedy and even if you use no more than the Free Trial treatment you will be very materially benefited.

FREE TRIAL OFFER

I want every reader of this, who suffers in any way from painful monthly periods, irregularities, leucorrhoea, inflammation or congestion of the womb, pains in the back, etc., to send me their addresses, and I will forward at once, without charge, 10 days' treatment. If your case is not far advanced it may entirely cure you, and in any event it will do you much good. I am so earnest in making this statement, and so positive that it is true, that I trust every sufferer who reads this notice will take advantage of my offer and get cured at home, without a doctor's bill. Address, enclosing 3 stamps, MRS. FRANCES E. CURRAH, Windsor, Ont.

pigs required attention and took most of his time. Some months later, in desperation, he seized a sheet of paper and wrote "160" across it and mailed it to Morgan. Morgan returned it asking far explanation. Flannery replied:

"There be now one hundred sixty of them dago pigs for heavens sake let me sell off some, do you want me to go crazy, what?"

"Sell no pigs," Morgan wired.

Not long after this the president of the express company received a letter from Professor Gordon. It was a long scholarly letter, but the point was that the guinea-pig was the Cavia aparoea while the common pig was the genius Sus of the family Suidae. He remarked that they were prolific and multiplied rapidly.

"They are not pigs," said the president, decidedly to Morgan. "The twenty-five cent rate applies."

Morgan made the proper notation on the papers that had accumulated in File A6754, and turned them over to the Audit Department. The Audit Department took some time to look the matter up, and after the usual delay wrote Flannery that as he had on hand one hundred and sixty guinea-pigs, the property of consignee, he should deliver them and collect charges at the rate of twenty-five cents each.

Flannery spent a day herding his charges through a narrow opening in their cage so that he might count them.

"Audit Dept." he wrote, when he had finished the count, "you are way off there may be was one hundred and sixty dago pigs once, but wake up don't be a back number. I've got even eight hundred, now shall I collect for eight hundred or what, how about sixty-four dollars I paid out for cabbages?'j

It required a great many letters back and forth before the Audit Department was able to understand why the error had been made of billing one hundred and sixty instead of eight hundred, and still more time for it to get the meaning of the "cabbages."

Flannery was crowded into a few feet at the extreme front of the office. The pigs had all the rest of the room and two boys were employed constantly attending to them. The day after Flannery had counted the guinea-pigs there were eight more added to his drove, and by the time the Audit Department gave him authority to collect for eight hundred Flannery had given up all attempts to attend to the receipt or the delivery of goods. He was hastily building galleries around the express office, tier above tier. He had four thousand and sirty-four guinea-pigs to care for! More were arriving daily.

Immediately following its authorization the Audit Department sent another letter, but Flannery was too busy to open it. They wrote another and then they telegraphed:

"Error in guinea-pig bill. Collect for two guinea-pigs, fifty cents. Deliver all to consignee.

Flannery read the telegram and cheered up. He wrote out a bill as rapidly as his pencil could travel over paper and ran all the way to the Morehouse home. At the gate he stopped suddenly. The house stared at him with vacant eyes. The windows were bare of curtains and he could see into the empty rooms. A sign on the porch said. "To Let." Mr. Morehouse had moved! Flannery ran all the way back to the express office. Sixty-nine guinea-pigs had been born during his bsence. He ran out again and made feverish inquiries in the village. Mr. Morehouse had not only moved, but had left West-

NAME.....

ADDRESS .....

cote. Flannery returned to the express office and found that two hundred and six guinea-pigs had entered the world since he left it. He wrote a telegram to the Audit Department.

"Can't collect fifty cents for two dago pigs consignee has left town address unknown what shall I do? Flannery."

The telegram was handed to one of the clerks in the Audit Department, and as he read it he laughed.

"Flannery must be crazy. He ought to know that the thing to do is to return the consignment here," said the clerk. He telegraphed Flannery to send the pigs to the main office of the company at Franklin.

When Flannery received the telegram he set to work. The six boys he had engaged to help him also set to work. They worked with the haste of desperate men, making cages out of soap boxes, cracker boxes, and all kind of boxes, and as fast as the cages were completed they filled them with guinea-pigs and expressed them to Franklin. Day after day the cages of guinea-pigs flowed in a steady stream from Westcote to Franklin, and still Flannery and his six helpers ripped and nailed and packed—relentlessly and feverishly. At the end of the week they had shipped two hundred and eighty cases of guinea-pigs, and there were in the express office seven hunhred and four more pigs than when they began packing them.

"Stop sending pigs. Warehouse full," came a telegram to Flannery. He stopped packing only long enough to wire back, "Can't stop," and kept on sending them. On the next train up from Franklin came one of the company's inspectors. He had instructions to stop the stream of guinea-pigs at all hazards. As his train drew up at Westcote station he saw a cattle-car standing on the express company's siding. When he reached the express office he saw the express wagon backed up to the door. Six boys were carrying bushel baskets full of guinea-pigs from the office and dumping them into the wagon. Inside the room Flannery with his coat and vest off, was shoveling guinea-pigs into bushel baskets with a coal scoop. He was winding up the guinea-pig episode.

He looked up at the inspector with a snort of anger.

"Wan wagonload more an' I'll be quit of thim, an' niver will ye catch Flannery wid no more foreign pigs on his hands. No, sur! They near was the death o' me. Nixt toime I'll know that pigs of whativer nationality is domestic pets—an' go at the lowest rate."

He began shoveling again rapidly, speaking quickly between breaths.

"Rules may be rules, but you can't fool Mike Flannery twice wid the same thrick— whin it comes to live stock, dang the rules. So long as Flannery runs this expriss office—pigs is pets—an' cows is pets—an' horses is pets—an' lions an' tigers an' Rocky Mountain goats is pets—an' the rate on thim is twinty-foive cints."

He paused long enough to let one of the boys put an empty basket in the place of the one he had just filled. There were only a few guinea-pigs left. As he noted their limited number his natural habit of looking on the bright side returned.

"Well, annyhow," he said cheerfully, "'tis not so bad as ut might be. What if thim dago pigs had been elephants!"

THE END.

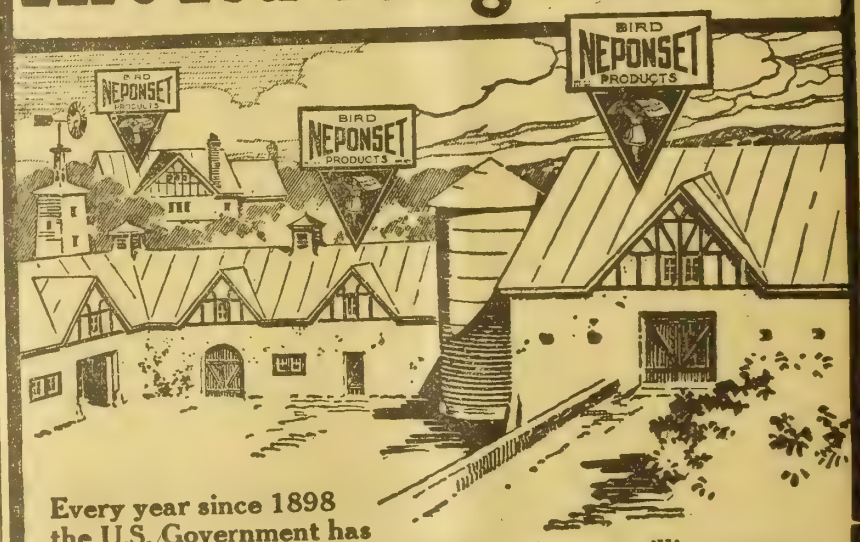
Are You Going to Build?



Every year since 1898 the U.S. Government has bought Neponset Pariod Roofing—often a million square feet at a time—for use at home—in Alaska—Panama—the Philippines—in the coldest as well as the hottest climates.

Do you need stronger proof of the wearing qualities, economy, and the satisfaction that NEPONSET Paroid Roofing affords?

Do you want proof nearer home? We will give it to you. We will tell you where you can see a NEPONSET Paroid Roof. See how it looks, learn how long it has been on, and hear what the owner has to say about it.

NEPONSET PAROID Roofing

is sold on *proof*, not promises.

NEPONSET **PAROID Roofing** for the roofs and sides of barns, stables, poultry buildings. Slate in color. Costs less than shingles. Resists fire.

For brooder houses, sheds and temporary buildings that require low-cost roofing, use **NEPONSET RED-ROPE Roofing.** Far superior in every respect to tarred felt. It has been the standard low-cost roofing for twenty-five years.

NEPONSET **PROSLATE Roofing,** for roofs and sides of residences and all buildings calling for artistic roofs and siding. Looks like shingles, wears like slate.

NEPONSET **WATERPROOF Building Paper** for use under clapboards and shingles, in walls of residences, etc. Keeps out dampness, cold and draughts. Cuts fuel bill one-third every winter.

Consult Our Building Counsel Department. Tell us what kind of building you intend to erect or repair. State exact dimensions and we will send you illustrated suggestions for different types of buildings, or give you expert advice on any building question.

Bird Neponset dealers everywhere. If you do not know the one in your locality, ask us.

A Cure for Consumption.

No less a medical authority than Dr. Osler says: "The cure of tuberculosis is a question of nutrition; make the patient grow fat and the local disease may be left to take care of itself."

Many others who have occupied the highest positions in the medical profession have said the same. Dr. B. B. Kendall, of Illinois, points out a successful way of accomplishing it. He says:

Dueing the last 15 years I have prescribed the following diet in hundred of instances, and where directions have been followed conscientiously it has increased the weight, strength and vitality of the patient rapidly, thus enabling nature to help herself.

The all important thing is to drink large quantities of milk strippings (the very last of the milking, which is all cream, when a proper cow is selected). This seems so simple and easy that many have refused to follow directions, and demanded medicines to cure them.

To get best results a healthy cow should be selected, one that does not cough, and one that gives very rich milk.

The last quart of milk should be milked into a separate dish, which rests in a larger vessel containing warm water just sufficient to prevent the strippings from cooling below blood heat. The cow should be thoroughly cleaned to prevent any dirt getting into the milk, so the patient can blow back the froth and drink at once, without straining, as this would cool it too much.

Begin by drinking nearly a pint in the morning and the same at night, and increase the quantity gradually, so that in 10 or 15 days a full quart will be taken twice a day. Remember, it should be taken immediately after milking, before it has had time to cool any. All should be taken that can be without too much discomfort, and then rest a few minutes and drink more and rest again, and so on until a full quart has been taken. In about 15 minutes after this the patient should eat at the table such articles of food as are known to agree with the stomach.

When the strippings are not allowed to cool below blood heat, and taken immediately after milking, a full quart will be transfused into the circulation in a remarkably short time. Remember, that the great secret of success is in taking milk immediately after milking, and not allowing it to cool below blood heat, taking a full quart morning and evening, and having milk that is very rich.

It is easier for those living on a farm than those "existing" in a city to carry out this method. I do not remember any case that was not too far gone and that followed the direction strictly that was not cured. I have found the same diet, when above directions were carried out carefully, equally successful in increasing the weight and strength of those run down and debilitated from other causes.

Plenty of fresh air night and day will also help the good cause along. Keep up the treatment until cured, no matter how long it will take.

Why the Wedding Ring is so Placed.

The question of the wedding ring and why it should be placed on the fourth finger of the left hand is traced back to a writer in the British Apollo (1708).

"There is nothing more in this," it is stated "than that the custom was handed down to the present age from the practice of our ancestors, who found the left hand more convenient for such ornaments than the right in that it is ever less employed; for the same reason they chose the fourth finger, which is not only less used than either of the rest, but is more capable of preserving a ring from bruises, having this one quality peculiar to itself, that it cannot be extended but in company with some other finger, whereas the rest may be singly stretched to their full length and straightness."

Could we afford to buy and give away hundreds of thousands of 50-cent bottles of Psychine (pronounced Si-keen) if we did not know from a third of a century's experience that it was the greatest vitality-builder of the age?

You know what it would mean to us were Psychine a preparation without a definite, beneficial action.

After the first bottle which we would buy, no more would be purchased.

And we would go out of business. But we're not going out of business, and our confidence that we're not is based upon our third of a century's experience with Psychine.

Ten years after Confederation we commenced compounding Psychine.

Since that time, we have sold many millions of bottles.

We have cured many hundreds of thousands of virulent and oftentimes fatal cases of diseases.

We have in our files many hundreds of thousands of unsolicited testimonials.

And we have grown from a small beginning to be one of the largest proprietary manufacturers in this country.

Here then is proof that we have in Psychine a preparation with abundant and demonstrated effectiveness, more so than any other preparation we, or anyone else, ever heard of.

Here then is the reason of our unalterable confidence in Psychine, that it is in fact the greatest preparation of its kind in the world.

Here then is why we have inaugurated a policy of actually buying hundreds of thousands of bottles of Psychine to give to those who should use.

To those who are blindly groping in the dark for relief from their misery, who may perhaps be using wrong methods to recover their health and their strength.

* * *

LAGRIPPE.

The greatest and most effective agents for the bodily health are the white corpuscles, phagocytes.

These white corpuscles eat any germ of disease that gains an entrance to the body, when they're in large enough numbers and sufficiently strong.

When they're not sufficiently strong, the disease germs devour them and disease holds the body.

* * *

For centuries almost, herbs, nature's own remedies, have been the most efficient foe to disease.

We have not known very definitely just how.

But now science tells us that certain of these herbs increase the number of the white corpuscles and their strength.

These certain herbs are incorporated in Psychine.

We go to the ends of the earth for these herbs—to Arabia, to South America, to China and to Japan.

They are compounded in the most costly chemical appliances in this country.

And the result is Psychine—for a third of a century the most effective vitality-builder the world has known.

The one preparation that has cured many thousands of the following diseases:

La Grippe	Bronchial Coughs
Bronchitis	Weak Lungs
Hemorrhages	Weak Voice
Sore Throat	Spring Weakness
Anaemia	Early Decline
Female Weakness	Catarrhal Affections
Indigestion	Catarrh of Stomach
Poor Appetite	Night Sweats
Chills and Fevers	Obstinate Coughs
Sleeplessness and	Laryngitis and
Nervous Troubles	Dyspepsia

After-effects of Pleurisy, Pneumonia and La Grippe

Now we don't ask you to take our word for the tremendously beneficial effect of Psychine. Fill out the coupon below, mail it to us and we'll give your druggist an order (for which we pay him the regular retail price) for a 50-cent bottle of Psychine to be given you free of cost.

We will undoubtedly buy and distribute in this manner hundreds of thousands of these 50-cent bottles of Psychine.

And we do that to show our entire confidence in this wonderful preparation.

A confidence that has been based on our 30 years' experience with this splendid preparation, with a full knowledge of the hundreds of thousands of cures it has made.

COUPON No. 77

To the Dr. T. A. SLOCUM, Ltd.
193-195 Spadina Ave., Toronto

I accept your offer to try a 50c. bottle of Psychine (pronounced Si-keen) at your expense. I have not had a 50c. bottle of Psychine under this plan. Kindly advise my druggist to deliver this bottle to me.

My Name.....

Town.....

Street and Number.....

My Druggist's Name.....

Street and Number.....

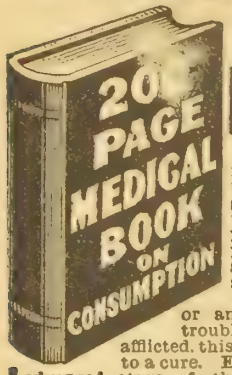
This coupon is not good for a 50c. bottle of Psychine if presented to the druggist—it must be sent us—we will then buy the 50c. bottle of Psychine from your druggist and direct him to deliver it to you. This offer may be withdrawn at any time without notice. Send coupon to-day.

These Toasted Corn Flakes require no cooking. They are a most nutritious and easily digested food, ready to be served with milk, cream or fruit.
Note the high class premium found in every package.

ORANGE MAIZE

When a cold becomes settled in the system, it will take several days' treatment to cure it, and the best remedy to use is Chamberlain's Cough Remedy. It will cure quicker than any other, and also leaves the system in a natural and healthy condition. Sold by all dealers.

Consumption Book FREE



This valuable medical book tells in plain, simple language how Consumption can be cured in your own home. If you know of any one suffering from Consumption, Catarrh, Bronchitis, Asthma or any throat or lung trouble, or are yourself afflicted, this book will help you to a cure. Even if you are in the advanced stage of the disease and feel there is no hope, this book will show you how others have cured themselves after all remedies they had tried failed, and they believed their case hopeless.

Write at once to the Yonkerman Consumption Remedy Co., 1622 Rose Street, Kalamazoo, Mich., and they will send you from their Canadian Depot the book and a generous supply of the New Treatment, absolutely free, for they want every sufferer to have this wonderful cure before it is too late. Don't wait — write today. It may mean the saving of your life.

THE ORIGINAL AND ONLY GENUINE

BEWARE OF IMITATIONS SOLD ON THE MERITS OF MINARD'S LINIMENT

Minard's Liniment Co., Limited

SEND US 75c. Receive by return mail, post paid, this beautiful little dress. It is made with a little waist joined with a wide belt to a full pleated skirt. W. F. YOUNG, P.D.F., 124 Temple St., Springfield, Mass
LYMANS Ltd., Montreal, Canadian Agents.

The old, old story, told times without number, and repeated over and over again for the last 36 years, but it is always a welcome story to those in search of health—There is nothing in the world that cures coughs and colds as quickly as Chamberlain's Cough Remedy. Sold by all dealers.

FLORICULTURE.

Correspondent writes:—Will you kindly tell me how to grow a Rubber Plant? Small, white insects come to the surface when I water it and some of the leaves have turned yellow and fallen off.

Ans.—Water this plant with lime water, made by slacking a lump of stone lime, as large as a hen's egg, in a pail of water. Allow it to settle and use the clear water. Three applications, three days apart usually effects a sure cure. Water freely with clean water a couple of hours after using the lime. See that the drainage is perfect, this is most important.

Hampton, writes:—Will you kindly let me know the name of the tree that enclosed leaf comes from? Is Silver Maple suitable for street and lawn planting? Is it better to set trees out in the fall or spring and in what month?

Ans.—The leaf is from the Acer Saccharinum. The Maple are not good trees to select for street or lawn planting, as the branches are not strongly attached to the trunks, and are easily broken by winter storms. They are also very susceptible to borers when planted on dry, city streets.

Don't fertilize shrubs, roses or perennials from now on. Good ripe wood is what is required now. A sappy, late growth is sure to winter kill.

Newcastle, wants to know when he can plant a Lilac Hedge. What month and what size do you recommend? Do they require good soil? I have a fine bed of Stocks, from which I wish to save some seed, but there seems to be seed pods only on the Single Stocks? What is the best sort of Fuchsia for hanging pots?

You had better plant your Lilac Hedge in October or November. Failing to do so, very early in the spring, as soon as frost is out, as the Lilac starts growth very early.

The single Stocks only bear seed. You should get a fair percentage of double stocks from home grown seed if selected from sturdy plants, but not as many as from European grown, as our season is not long enough for proper development.

The double Stocks have an imperfect flower and does not produce seed.

The best sort of Fuchsia for a hanging pot, is probably the Storm King, an old favorite but a good one. It is purplish white and scarlet, of strong habits and droops well.

Chatham, correspondent wants to know what time to plant Peony roots, spring or fall, also, can I remove a large Rose bush this fall?

Plant Peonies in fall and your Rose in spring. Peonies can be transplanted early in September.

A Rose bush can be removed in the fall with very good results.

A light dressing of soot is good for the Pansy bed now.

For lice on Rose bushes, soak a fig of tobacco in one quart boiling water for a few hours and dilute this one-half strength and sprinkle the bushes. Two applications will usually suffice. Strong Castile soap suds is also good.

A, Chatham, N. B., writes: Would you kindly tell me how to take care of Verbenas, during the winter? I have been told that they will live in the cellar, in boxes of earth. If so, should they be watered or kept in the dark unwatered like Geraniums? I can winter Geraniums successfully in this manner. If Verbenas are kept over, how should they be treated in the spring?

I have never tried to winter Verbenas as described, as I always take cuttings in th? fall and grow the plants in pots all winter when I desire to keep a particular variety. If you try to winter in the cellar, they would require a little water occasionally. Should you succeed in wintering them I would think you would need to cut them back well before planting out in the spring.

The Wallflower may be potted up or boxed before heavy frosts and treated as you would Geraniums. You can thus bloom them over during the winter.

O. G., of Hampton, writes—When is the best time to plant young trees such as lilac, birches, maples, etc., etc.? Is the fall or spring the best time to plant sweet peas? When should Asters be planted?

Lilacs are planted equally well in fall or spring. Plant birches or maples in the spring, only, for best results. Aster seeds should be sown during the months of March, April or May, according as early or late plants are required.

It will soon be time to think about planting hardy plants such as Peanies, Phlox, etc., which are better planted in the fall.

If you have a vacant spot in your garden, plant hardy plants, that will winter well and bloom next season without trouble or expense. Then comes the bulbs, one gets so much bloom from. A few Tulips will bloom in early spring, long before the spring seedlings come in bloom, and the bulbs last in the ground from year to year, The bulbs are coming in now, and want to be planted before the ground freezes. There is nothing better than a bed of Tulips with border of Crocus and Seilias, the little blue flowers that lasts so long and look so much like our little violets, in early spring.

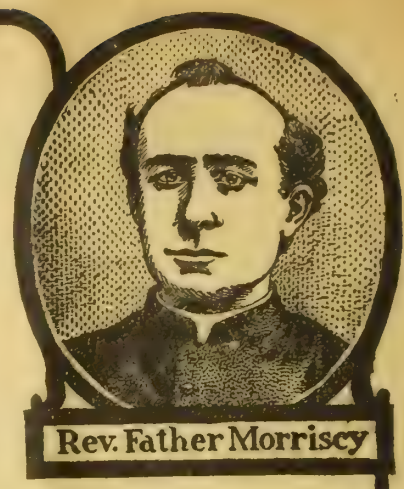
The Garden Hyderangea is now in bloom and it is a wise thing to cut most of the buds from plants set out in early spring. Tehy are apt to flower heavily and take from them the vitality so much required for their first winter.

Be prepared for early frosts so as not to let the tender plants get chilled on cold nights, until they are taken in out of the garden. Such plants as Begonias, Heliotropes and Coleus should have a light covering of some sort thrown over them.

Do not allow weeds to get ahead of you, now, as they have plenty of time to go to seed before the ground freezes.

I would judge from the description of a correspondent's rose bush, that sends up a strong sprout, from the roots, as large as one's finger, with large leaves and which shows no signs of budding, that the rose was a budded one and that the top had killed down last winter so that the sprouts are those of the wild rose roots that seldom bloom in this climate. Examine the base of the plant and if there is a lump on the stalk, about six inches from the crown of the roots, with branches coming therefrom, it is a budded plant and if these branches are dead and the strong sprouts come from below it is probably useless and had better be thrown away Sprouts should never be allowed to grow below the bud on such roses and growers of budded Roses should should watch that they do not get a start..

A Positive Cure For Rheumatism



For many years, both during Father Morriscy's lifetime and since he passed away, his No. 7 Tablets have been curing many of the worst cases of rheumatism in Eastern Canada.

During his lifetime it became the custom, when people could not get relief from other sources, to consult Father Morriscy, and few indeed did so in vain. His standard prescription came to be called

Father Morriscy's No. 7 Tablets

and it can now be procured from any druggist or dealer in medicine.

No. 7 Tablets act directly on the kidneys, stimulating them so that they can remove from the blood all the Uric Acid, which alone causes the rheumatism. Two or three weeks' treatment cures ordinary cases, while with the worst chronic cases it seldom takes more than three or four boxes of No. 7 Tablets to thoroughly eradicate the rheumatism from the system.

In every case, right from the start, the sufferer gets relief from the torturing pains and aches.

We would be glad to refer you to one-time rheumatics, now well through taking Father Morriscy's No. 7 Tablets.

Father Morriscy Medicine Co., Ltd., - Chatham, N.B.

MAIL CONTRACT.

SEALED TENDERS addressed to the Postmaster General will be received at Ottawa until noon on Friday, 11th November, 1910, for the conveyance of His Majesty's Mails, on a proposed Contract for four years four times per week each way, between Newtown and Sussex from the first January next.

Printed notices containing further information as to conditions of proposed Contract may be seen and blank forms of tender may be obtained at the Post Office of Newtown, Sussex and route offices and at the office of the Post Office inspector at St. John.

POST OFFICE DEPARTMENT,
MAIL SERVICE BRANCH,
Ottawa, 26th September, 1910.
G. C. ANDERSON,
Superintendent.

Lame back comes on suddenly and is extremely painful. It is caused by rheumatism of the muscles. Quick relief is afforded by applying Chamberlain's Liniment. Sold by all dealers.

Chronic Mamminitis.

Ayrshire.—A small cow, good milker, that freshened July 10th, 1910, was attacked with garget. I applied a warm saturated solution of common salt to the udder twice daily and under the treatment the trouble seemed to subside. But it returns in spite of persistant bathing of udder in solution as hot as could be applied. The disease now affects three teats—one more than the others. Milk will appear perfectly good for some days and then a quantity of thick matter will be found on straining it. The cow is a good one—milked a trifle over 7600 lbs. between May 28th 1909 and the same date 1910. I should be very glad to have your veterinary expert indicate a line of treatment.

Ans.—Congestion of the udder, or part of it, (Garget) may merge into inflammmation (Mammitis) and into a chronic form. During these stages the functions of the diseased parts are changed sometimes causing the milk to clot in the milk cistern and at other times becoming stringy. In one case investigated by Dr. Law the stringy condition developed after the milk was drawn and was caused by the drinking water which oozed from a bank of black muck and as the first necessity in treatment is removal of the cause therefore, the food and water should be pure. For treatment, a physic is advisable, for a small cow one pound of Epsom salts and one ounce of ginger mixed in one quart of milk warm water and given as a drench constitutes a dose. Afterwards feed only wheat bran mash and give water every eight hours for 24 hours, then feed egsily digested food and give in food or as a drench four drams of Nitrate of Potash, twice a day for three days, and afterwards three drams of Hyposulphite of Soda, night and morning in food or as a drench. If either of the above is given as a drench dissolve them in half a pint of water.. Bathe the udder three times a day with warm water and milk gently and clean during bathing. Rub dry and thenrub in an embrocation made by mixing one ounce of spirits of Camphor, one ounce of fluid extract of Belladonna and one pint of raw linseed oil.

J. STANDISH, V S.

The "Ten Demandments."

A Western manufacturer has posted conspicuously several copies of a new decalogue which he calls "The Ten Demandments." Here they are:

First—Don't lie—it wastes my time and yours. I'm sure to catch you in the end, and that's the wrong end.

Second—Watch your work, not the clock. A long day's work makes a long day short, and a day's short work makes my face long.

Third—Give me more than I expect and I will pay you more than you expect. I can afford to increase your pay if you increase my profits.

Fourth—You owe so much to yourself you can't afford to owe anybody else.

Fifth—Dishonesty is never an accident. Good men, like good women, can't see temptation when they meet it.

Sixth—Mind your own business and in time you will have a business of your own to mind.

Seventh.—Don't do anything here which hurts your self-respect. The employee who is willing to steal for me is capable of stealing from me.

Eighth—It is none of my business what you do at night, but if dissipation affects what you do next day and you do half as much as I demand, you'll last half as long as you hoped.

Ninth—Don't tell me what I like to hear, but what I ought to hear. I don't want a valet to my vanity, but I need one for my dollars.

Tenth—Dan't worry if I kick— if you're worth while correcting, you're worth while keeping. I don't waste time cutting specks out of rotten apples.

EXCEPTIONAL VALUE.

8005.

We present here two extra value Misses Dresses. We know you will like either one of these as the style, fit material and finish is first class in every respect. We aim to give our friends a full standard of value in every respect, whether it is our cheapest or best grade.

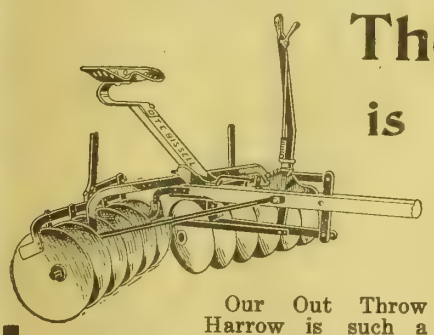
Montgomery Ross & Co.,

Box 110, Station B., - - MONTREAL, QUE.



The "Bissell" Out Throw

is very lightest draft.

Our Out Throw Harrow is such a great success we have decided to advertise it and give you your choice between it and the famous "Bissell" In Throw Harrow. Other Out Throw Harrows are usually heavy draft,—heavy on horses' necks. But the "Bissell" Out Throw is light draft—easiest on horses' necks of any out throw harrow. The location of arch directly over gangs and projection of seat in the rear of harrow take weight off horses' necks. Instead of setting opposite to each other, one gang is set slightly ahead of the other, which prevents crowding or bumping together. All parts are in correct proportion—that's why draft is so very light. Ask Dept. M. to send you booklet, fully describing the "Bissell" Out Throw and In Throw Harrows, which are also made with Two Levers for hilly territory. 16 plate wide cut harrows a specialty with us. Remember it isn't a genuine "Bissell" unless the name "Bissell" is stamped on the harrow.

T. E. BISSELL CO., Limited, . Elora, Ont.

The Tenth Maritime Winter Fair.

The prize list ol the Tenth Maritime Winter Fair, which will be held in Amherst, N. S., on December 5th, 6th, 7th and 8th, has been in the hands of the public for over a month. If you have not received a copy send for one to Mr. F. L. Fuller, Truro, N. S. The Winter Fair has been steadily growing in attractiveness and popularity since its inception.Last year, new additions were made to the buildings but so rapid is the progress of advancement that every foot of space was occupied. We look forward to the tenth fair as one that will eclipse all its predecessors.

The management has the running expenses reduced to a minimum so that they are able to put a considerable amount up for competition in the various classes. There are also a large number of special prizes. If you have anything to show at the fair be sure to make your entry before November 15th.

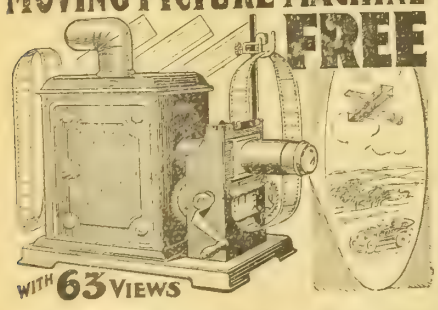
It has been customary in past years to admit ladies and children free, but this year the management has decided to charge an admission fee of fifteen cents. The public will not object as they will have an opportunity of seeing the best live stock show in Eastern Canada.

Can Farmers Afford to Sell Skim Milk ?

For some time we have had under serious consideration the advisability of establishing a casein manufacturing plant in connection with the Dairy Department of the Ontario Agricultural College, because of the agitation at present in favor of this business as a side line for a creamery. A number of our creamery-men have already installed a casein plant at a cost of $300 to $600, and it is hard to say what the outcome will be. The price of "dried" casein at present is about seven cents per pound, and about three pounds of canein may be got from 100 lbs. skim milk. Those creamerymen purchasing the skim-milk from the farmers are paying about fifteen cents per 100 lbs. for it, and in most cases are returning the "casein whey" to the farmer, or are allowing them to take it, in addition to the price paid for skim-milk.

There are two methods adopted in precipitating the casein from the skim-milk—by the use of rennet and by the use of dilute sulphuric acid. There seems to be some doubt about the advisability of feeding whey containing sulphuric acid to pigs. A noted American authority advised against its use recently. The American firm, however, which is pushing this phase of the question in Canada claim that they have absolute proof that H2 SO4 (sulphuric acid) whey is all right for our financial friend—the hog.

MOVING PICTURE MACHINE FREE



This wonderful imported Moving Picture Machine with 2 films with 63 views. ALL GIVEN FREE for selling 24 pieces of our goods at 10c each. Get this marvelous Machine and earn plenty of money. Write for goods. When sold return $2.40 and we will send Moving Picture Machine and films with 63 views. FRIEND SOAP CO., Dept. 806, Boston Mass.

We understand that there is a strong demand at present from the paper manufacturers and from furniture manufacturers, as well as others for casein, and this has caused a rise in price. How long this will continue it is difficult to say. A representative of one American firm recently said that they were in the market to get all the casein they could purchase at present, but as soon as they were stocked they would cease buying. He said, "A few years ago we bought all the casein we needed for four cents a pound, now we are paying seven cents." Casein is not a staple product like butter and cheese, hence the market is somewhat uncertain. Still, we haven't answered the questian.

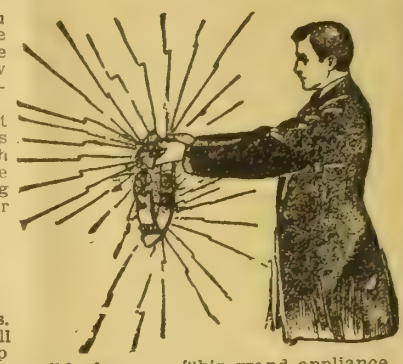
SKIM-MILK AS FEED FOR LIVE STOCK.

Unfortunately we have very little data on the question as to the value of skim-milk as a food for live stock. It is a question so complicated with the value of other foods fed, price of hogs and cattle, skill of the feeder, etc., that it is a well-nigh hopeless task to get accurate data on the counts raised.

In some experiments conducted at the Ontario Agricultural College during the years 1908 and 1909 (for full details of which readers are referred to the reports for those years) it was found, in 1908 that "skim-milk gave the largest gain per pig, as well as the most economical gain." It was further found that the skim-milk was worth 63½ per cent. more than separated whey, and 38½ per cent. more than ordinary whey. In 1909 the skim-milk proved to be 29 per cent. more valuable than ordinary whey, and was equal to 13.28 lbs. meal. If we allow 1½c. per pound as the value of the meal, we have nearly 20 cents as the value of 100 lbs. skim-milk fed to pigs.

Near Guelph we have to pay the farmers 20 cents per 100 lbs. whole

Weak, Run Down, Worn-Out Men



Why will you be weak? Why do you go on from day to day when you know you are losing your nerve force—your manhood—when you see a cure within your grasp? Do not delay a matter which is the key to your future happiness. Whatever your condition to-day, you will not improve as you grow older. Age calls for greater vital force, and the older you get the more pronounced will be your weakness.

I have the grandest invention of the age for weak, run-down, worn-out men; the surest and easiest cure for all nervous and chronic diseases. Its wonderful power is directed to the seat of the nervous system, through which its vitalized strength penetrates into all parts of the body, carrying new life to every function which has been weakened by disease or dissipation, restoring energy to the brain and power to the system. No weak man will regret a fair trial of the invigorator.

DR. McLAUGHLIN'S ELECTRIC BELT

will make you strong. It will send the lifeblood dancing through your veins. You will feel the exhilarating spark warm your frame, the bright flash will come to your eye, and a firm grip to your hand, and you will be able to grasp your fellow-countryman and feel that what others are capable of doing is not impossible for you. This grand appliance has brought strength, ambition and happiness to thousands of men in the past year.

It is the one sure remedy for the cure of Rheumatism, Weak Back, Weak Kidneys, Weak Stomach, Varicocele, loss of power in young or old, and similar ailments, as well as Dyspepsia, Constipation, etc. How can anyone remain in doubt as to the value of this grand remedy when you see so many cures by it?

To prove to you the confidence I have in the curative power of my Belt, I am willing to accept your case, and after I have cured you, then pay me. All I ask is reasonable security. You may then use my Belt at my risk, and

IF I DON'T CURE YOU MY BELT COMES BACK TO ME

You are out the time you spent on it—wearing it while you sleep—nothing more.

Nervousness---Sleeplessness---Run Down

Dear Sir,—One year ago last February I was taken with Nervous Exhaustion (the doctors pronounced it). I suffered all the tortures of that disease; was run down, so weak I could hardly do anything at all. Since I began to use your Belt there has been a marked improvement in my condition in the different ways mentioned. I have slept well every night since wearing your Belt, which is one of the greatest blessings of mankind. I have a great deal more ambition; work used to seem such a mountain now it seems more a pleasure; more strength and vim; memory better; digestion better; constipation about gone, with which I was bothered a great deal; head feels better, and I feel far better in every way. Yours truly,

NELSON ROSE, South Bay, Ont.

The Dr. McLaughlin Electric Belt is a cure for all signs of Breakdown in Men and Women. The Vitality of the body is Electricity—the force in the Nerve Cells. My Electric Belt will give you back this power and enable you to fight on in the Battle of Life!

Here's the Farm You Want!

600 cords wood, worth $5 per cord, 40,000 feet timber; if taken at once pair young horses, cow, all farming machinery, wagons, implements and 20 cords fitted wood will be included; carried 12 cows; splendid orchard 200 trees; 7-room painted house, water at sink, telephone; 2 good barns, tool and ice house; $2,200 is the sacrifice price,—a most remarkable bargain just out from one of Maine's best cities; all details and travelling instructions for this and other farms in South Maine, see page 8, "Strout's Biggest Farm Bargains," copy free. R. A. STROUT, Station 2612, Kent's Hill, Maine.

milk, in addition to the price paid for milk fat, in order to retain the skim-milk for educational or experimental purposes.

A prominent farmer in a dairy section of Ontario when asked about the prospects of securing milk for a "dried-milk plant" in his locality said, "The farmers around—would not sell their skim-milk for 40 cents a hundred pounds."

At the present price of hogs and hog products, and considering the great demand there is for stockers, heifers and milk cows, we do not see how farmers can afford to sell skim-milk for fifteen cents per 100 lbs. for the manufacture of casein or for any other purpose. Either the price paid for this dairy by-product must be increased, or else the business cannot be profitably conducted in this great stock-raising Province of Ontario. There are dairy districts, possibly, where farmers are not in a position to go in for stock-raising at present; or they may be afraid that if they go in for hogs extensively the price will tumble to a point below profit, as it did a few years ago, but as soon as our dairy farmers can do so, and as soon as the packers can assure them of a profitable and steady price, I feel sure that skim-milk will be utilized as a food rather than as a commercial product. It was intended by nature as a food for nearly all classes of farm animals as well as mankind.

CAN WE AFFORD TO EXPORT NITROGEN?

There is another phase of the question worth considering. Skim-milk contains that costly element nitrogen; and also considerable quantities of potash and phosphoric acid. We have reason to quarrel with the cheese industry of Canada because it robs the soil of its fertility. We have been exporting tons of nitrogen phosphoric acid and potash to Great Britain in the form of cheese and have robbed our soils for inadequate returns. We have no desire to "knock" the cheese business of Canada, but it is doomed to pass away, as surely as our farmers find out what it means to export farm fertility. No amount of "coddling" can stem the tide which has already set in. The creamery promises to solve the problem, but if we sell our casein to a foreign country we are as badly off as formerly, so far as it affects soil fertility, which is the basis of agricultural prosperity in every country. "As the soil is, so is the heart of man," is the saying attributed to Byron.

Have you noticed how lean and hungry everything appears on a poor sandy farm? The pocket, body and mind of the owner of such a farm is lean and empty; the grass and the cattle have a stunted, starved appearance; the pigs have a shriller note in their piercing squeal; the hens cackle in a subdued, repressed, half-scared tone, as if they are afraid to call their owner's attention to the fact that they are hungry; the buildings and fences have a dilapidated, wobbly look, as if the strong winds of adversity had been too much for their frail hold upon the soil; the trees are stunted, half uprooted, having lifeless limbs attached as if they were undecided whether to die or live—in fact the whole farm reminds one of an early potato patch touched with a June frost.

Can a man rob the soil and expect to prosper? Verily, he cannot.—PROF. H. H. DEAN, O. A. C., Guelph, Ont., in Canadian Farm.

The "Waterloo Boy" Does the Work of Many Men on the Farm.

Record Attendance at Nova Scotia Agricultural College.

The Agricultural College at Truro, opened on Tuesday, Nov. 1st. The present enrollment is forty-eight, but from ten to twenty more students are expected. Last year the enrollment was forty-three. It will therefore be seen that the College is making good growth and is being appreciated by the farmers of the Provinces. There are students from Yarmouth County in the west to Cape Breton in the east, and there are also a few from P. E. I., New Brunswick and Great Britain.

This promises to be by far the most successful session yet conducted at the College.

STOCK NOTES.

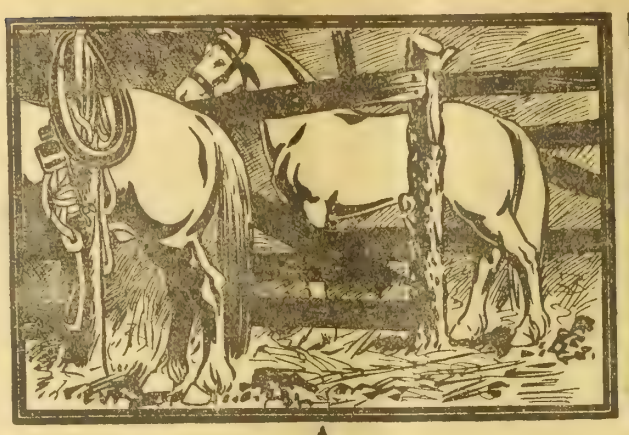
Mr. W. W. Geldert, Coverdale, Albert Co., N. B., has recently purchased a promising young Ayrshire bull from Mr. J. Frank Roach, Sunnyside Stock Farm, Sussex, N. B.

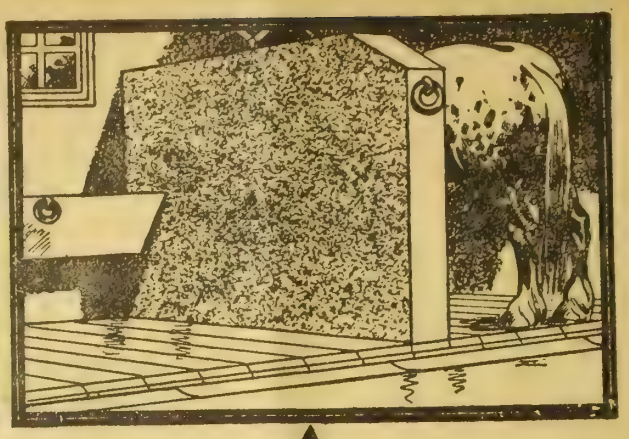
MORE HOLSTEINS.—We met Mr. P. G. Nase, son of F. W. C. Nase, Nerepis Station, N. B., at St. John, on the 3rd, inst., returning from Inson's auction sale. Mr. Nase already kerman, Ontario, where he purchased two promising heifers at Wm. Higginowns quite a herd of purebred Holsteins. He is on the warpath for improvement and these heifers, Netherland Kornuyke, a daughter of Sir Pontiac Clothilde Korndyke, the other Jewel Posch Thekla, by Sir Jewel Posch Prince, will be quite an acquisition to his herd.

SHEEP SOLD WELL.—Following is a summary of the purebred sheep sale which was conducted under the auspices of the New Brunswick Department of Agriculture, through Mr. Thompson, the importer, at Fredericton, N. B., on October 25th, 1910:—In all 53 animals were sold and they brought a total of $1,012.50, an average of almost $20 each, the prices ranging from about $15 up as high as $35.00. The principal purchasers were F. P. Robinson, of Nashwaaksis; J. E. Long, George Armstrong and C. L. Smith, of Carleton County; J. F. Tweeddale, M. P. P., and A. J. Jenson, of Victoria county, J. H. Masten, of Southampton, York county; J. R. Dunn, of Gagetown, Queens county, and R. M. Burden, of Westfield; the latter being the largest buyer of the sale. Bidding was brisk and Auctioneer C. I. Atherton put in a busy day.

AN IDEAL HOLSTEIN COW.—Mary Rooker II, the Holstein cow shown on another page of this issue is owned by Mr. W. M. Lea, Victoria, P. E. I. She was the sweepstakes female Holstein at the Halifax exhibition this fall and stood first in her class at Halifax and Charlottetown. She stood first in the aged cow class, at Charlottetown in 1908 as well as being the winner of the coveted honor of championship for the herd and grand championship over all dairy breeds. She also won the forty-eight hour dairy test against all comers Her owner considers her an ideal cow as she is a good doer under all conditions. She lays on fat readily when dry and sends it off again into the pail very quickly when fresh. After the hardships of a five weeks' trip to the shows, including a twelve mile walk to the railway station she has given nearly 1800 lbs. milk during the past month. This is the style of cow that our farmers should aim for. Large cows of good dairy capacity, no matter what breed.

A SUCCESSFUL NAW BRUNSWICK SHEEP BREEDER.—Three yegrs ago, Mr. Burder Goodwin, Baie Verte, N. B., bought a registered Oxford Down ram and ewe. The following year he bought two other ewes, so that his flock has increased to about twenty. Last year he sold three rams and five this year, but it is in the show ring where his talents as a herdsman have been most successful. With sheep of his own breeding from such a small beginning, at Halifax he was third on aged ewe, third on yearling ram, first on yearling ewe, second on aged pen, second on young pen, second on special for four lambs, first on special offered by the Oxford Down association for shearling ewe. At Charlottetown exhibition, P. E. I., this year he was third on shearling ram, first and second on ram lambs, second and fourth on aged ewes, third and fourth on shearling ewes, third and fourth on ewe lambs, second on aged pen and first on best pen of four lambs. This winning of first and second on ram lambs and first on best four lambs is very gratifying to Mr. Goodwin as it is paying him for the care and work he has devoted to his flock and at the same time it is





Which of These Pictures Best Represents Your Stable?

IF your Stable interior is of wood, you'll do well to tear down those old, unsightly stalls and mangers—and build new ones of Concrete.

In fact, the entire Stable—inside and out—should be built of Concrete.

This is the modern material—it has the merits of sightliness, endurance, and economy—and is sanitary.

The farmer himself can, by its use, make many little improvements that, with any other material, would require the employment of skilled labor.

IF you would know something of the possibilities of Concrete, fill out the coupon and send it to us. By return mail, we will send you a copy of our free 160-page book, "*What the Farmer Can Do with Concrete.*"

In this book you'll find complete instructions for the construction of almost everything you can think of, in the way of farm buildings, floors, vats, troughs, etc., etc.

Nowadays, for a farmer not to know how to mix and use concrete, is to confess himself away behind the times.

"*What the Farmer Can Do With Concrete*" will not only inform you—it will also interest you.

"What the Farmer Can Do With Concrete"

Tells you how to use concrete in constructing:

Barns	Hens' Nests	Stables
Cisterns	Hitching Posts	Stairs
Dairies	Horse Blocks	Stalls
Dipping Tanks	Houses	Steps
Foundations	Poultry Houses	Tanks
Fence Posts	Root Cellars	Troughs
Feeding Floors	Silos	Walks
Gutters	Shelter Walls	Well Curbs
		Etc., etc., etc.

Canada Cement Co., Limited
22-32 National Bank Building
MONTREAL

You may send me a copy of "*What the Farmer Can Do With Concrete.*"

Was So Bad With Heart and Nerves Could Not Sleep At Night.

Many men and women toss night after night upon a sleepless bed. Some constitutional disturbance, worry or disease has so debilitated and irritated the heart and nervous system that they cannot enjoy the refreshing sleep which comes to those whose heart and nerves are right.

Mrs. John Gray, Lime Lake, Ont., writes:—"Last summer I was so bad with my heart and nerves that I couldn't sleep at night. There was such a pain and heavy feeling in my chest that I could not stoop, and at at times I would become dizzy and have to grasp something to keep from falling. I tried different things but never got anything to do me any good until I tried Milburn's Heart and Nerve Pills and I can now recommend them to all troubled as I was."

Milburn's Heart & Nerve Pills are 50 cents per box, or three boxes for $1.25, at all dealers, or mailed direct by The T. Milburn Co., Limited, Toronto, Ont.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Extension to Breakwater at Lorneville, N. B.," will be received at this office until 4 00 p. m., on Wednesday, November 23, 1910, for the construction of an Extension to the Breakwater at Lorneville, Reed's Point, St. John County, N. B.

Plans, specification and form of contract can be seen and forms of tender obtained at this Department and at the offices of E.T.P. Shewan, Esq., District Engineer, St. John, N. B.; Geoffrey Stead, Esq., District Engineer, Chatham, N B., and on application to the Postmaster at Lorneville, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupation and place of residence. In the case of firms, the actual signature, and nature of the occupation, and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of public Works for the sum of two thousand eight hundred ($2,800.00), dollars, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned

The Department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, September 23, 1910.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

For Sale

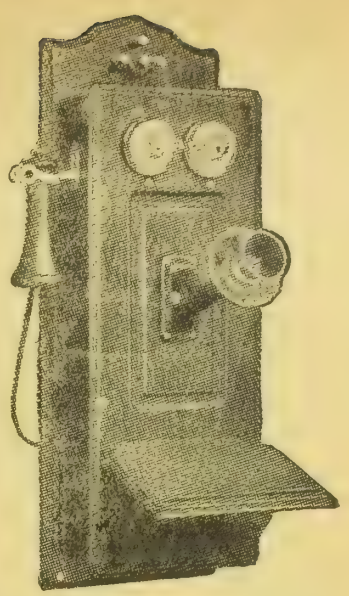
Full details and travelling directions to see this and hundreds of other splendid farms, many with live stock, tools and crops included, page 17, Strout's Biggest Barm Bargains, just out, copy free. Station 2612, E. A. STROUT, Kent's Hill, Maine.

an object lesson to the New Brunswick farmers that as good stock can be raised in this Province as any province in Canada and so save the continued drain on the province of sending money to Ontario, and other parts of Canada to improve their flocks and herds If farmers' sons only knew it and could realize it there are more and better opportunities in the Maritime Provinces for stock raising than in any other part of Canada, with better homes and more comforts. All any young man needs to do is to employ the same energy and perseverance as he would have to do in the West and he is bound to succeed.—A. H. THOMSON.

RAM SALE AT ST. STEPHEN.—The St. Srephen Agricultural Society held a very successful sheep sale during the exhibition held at St. Stephen, on the 25th to 30th, Sept. The sheep offered consisted of Oxford Downs, Shropshires and Cotswolds. The Oxford Downs with their great size, were a revelation to the farmers of that part of the province many not being convinced they were lambs until after examining their mouths. A good deal of credit is due a New Brunswick breeder, Mr. Burder Goodwin, Baie Verte, for producing such lambs and conclusively proves to the farmers that with feed, care and attention as good stock can be raised in this Province as any in the Dominion. The first lamb sold went to Mr. J. Sutton Clark for twenty dollars. This lamb was second to his mate from same flock at Charlottetown exhibition this year in a very strong class which included lambs imported from Ontario, especially to win. Mr. H. H. Merryman obtained a very fine lamb at thirty-two dollars and fifty cents, this being the largest lamb offered having the advantage in age. Mr. Fred Pike got a bargain for seventeen dollars. The lamb was not in shape or trimmed up for sale, having been offered direct from pasture. Jos. Tweedle paid seventeen dollars for another unfitted lamb. J. L. Comb gave seventeen dollars for the last of the Oxfords which shows how good they all were and not much from which to choose. Archie Getchell obtained another bargain at fifteen dollars when he bought the only Cotswold offered. This lamb was second at Charlottetown exhibition this year in a large class, beating all the winners of the St. John exhibition. Geo. Winter bought for twenty dollars a splendid lamb of the ever popular Shropshire breed. Milo Trafford giving the same price for another unconditioned lamb, whilst Ernest Housin paid fifteen dollars for a late lamb, which in addition was lame from being hurt on the cars. He will however, undoubtedly grow into a fine sheep and do credit to the herd. These sheep will do an immense amount of good in that part of the province, which heretofore has not taken hold freely of the improved breeds of stock, but as they have now made a beginning it is hoped they will keep on with the good work. It was noticeable, the purchasers were all young men with aspirations to produce as good stock as can be obtained in any part of the Dominion. The sheep were supplied to the St. Stephen Agricultural Society through the Provincial Department of Agriculture, who are endeavoring to do so much good work for the stock interests of New Brunswick and the St. Stephen Society is to be congratulated on having the efficient secretary, Mr. Walter Stevens, to aid their efforts in improving their flocks and other stock for which there may be a demand.—A. H. THOMSON.

We beg to advise you that the Canadian Standard Bred Horse Society has been incorporated by the Department of Agriculture, gnd that a record for this breed has been opened under the Canadian National Record System. Any animal recorded as Standard in the American Trotting Register (Chicago), or whose sire and dam are so recorded, will be eligible for registration in the Canadian Standard Bred Stud Book. In addition, provision is made for the registered Standard Bred Pacers. Horses that the sire, and the sires of the first, second and third dams are all registered Standard Bred Trotters, or all registerexd Standard Bred Pacers. Horses will not be accepted for registration on in the American Trotting Register. performance unless previously recorded Heretofore, it has been necessary for importers of Standard Bred Horses, in order to obtain free Canadian Customs Entry, to apply to this office for an import certificate that their animals were recorded in the American Trotting has been opened, the Customs Regula- Register. Now that a Canadian Record tions will require Canadian registration Purchasers of animals in the United States should immediately forward to this office the American certificates, with transfers, properly endorsed, in order that there may be no delay in making customs entry, either at the border or at destination. Import cercertificates will be sent to any address desired. Breeders of Standard Bred horses, recorded in the Canadian Stud Book, will now be able to take advantage of the half rates for pure bred live stock for breeding purposes, shipped by freight over leading Canadian railways, in accordance with the agreement made between the Department of Agriculture and the Joint Freight Committee. You may become a life member of the society on payment of a fee of $25.00, or an annual member by paying $2.00 per year. Fuller particulars in regard to fees and rules may be found on the printed form enclosed. We will be pleased to have you join the society and record your horses in the Canadian National Records. If breeders will take hold of this matter in the spirit of hearty co-operation, we should soon have the strongest and most influential horse breeders' organization in Canada. —Rabt. Davies, President; Jno. W. Brant, Secretary.

Telephones for Free Trial



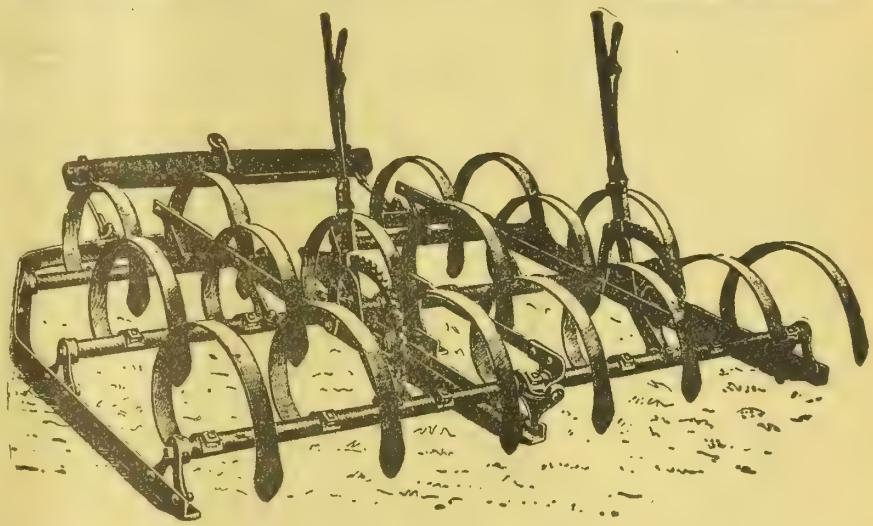
So sure are we of the all round superiority of our telephones that we will welcome the opportunity of sending you two or three for a comparison test with others.

Our telephones are made in Toronto in one of the best-equipped telephone factories in the world. They are built so as to give steady service without material depreciation. Their cost of maintenance is low enough to surprise you. And they are guaranteed for ten years.

But, if interested in rural telephones send for our two books. One, a handsomely illustrated book, entitled "Canada and the Telephone" shows, with thirty-two pictures, the benefits of the telephone to the farmer. The other, Bulletin No. 2, tells you how to organize, build and equip a rural telephone system.

BULLETIN NO. 1 is intended for distribution among companies already established. Ask for a copy. We carry a large supply of construction materials in stock and make a specialty of prompt shipments.

Canadian Independent Telephone Co., Ltd.
1820 Duncan St., Toronto.



We make Harrows all the year around. When the seeding season is through in the North we make them for the far away lands of the Southern Hemisphere. We are now shipping them to the far South, but we want to remind our home friends that when the Spring time comes again we can supply the best and most effective working Harrows made.

GRAIN—Oats, white 34c, black 37c.

FEED STUFFS—Bran, $21,00 to $24.00 per ton; shorts, $24 00 to $28.00; middlings, $26.00 to $30.00; oil-cake, $2.30 to $2.50 per bag; corn meal, $1 75 to $1 85.

LIVE STOCK—Butcher's cattle. 4½c to 5½c; stockers, 3c to 4c; milch cows, $40 to 50; sheep, 3½c to 4c; lambs, 5c to 5½c.

DRESSED MEATS—Beef, (carcass) 9c to 10c; beef (retail) 12c to 15c; mutton, carcass, 8c to 9c; lamb, carcass, 10c to 11c; pork, 7½c to 8c

HORSES—Drafters, $150 to $225; roadsters, $150 to $225; carriage, $150 to $225.

DAIRY PRODUCTS—Creamery butter, solid, 23c, prints, 24c to 25c; dairy butter, 18c to 20c; cheese, 11 1-8c.

POULTRY & POULTRY PRODUCTS—Eggs, 23c; fowl, 8c to 10c; chickens, 10c to 12c, ducks, 11c to 13c; geese, 10c to 12c; turkeys, 15c to 18c.

FRUIT—Apples, $2.00 to $4 00.

VEGETABLES—Carrots, 35c to 45c per bush; Potatoes, 40c; turnips, 12 to 13c; beets, 35c to 40c; parsnips, $1.00 per 100 lbs.

MISCELLANEOUS—Hay, pressed, $7 50 to $8.50: straw, $5.00 to $6.00; beef hides, 8c to 8½c; calf skins, 10c to 12c, sheep skins, 40c to 50c; lambs skins, 30c to 50c.

Trade is quiet but steady and quite a lot of farm produce is being marketed, prices are fairly steady, and with the exception of potatoes the supply of farm produce offering is quite sufficient for the demand. Oats are unchanged in price but there is a firmer tone to the market. Hay on the other hand is easier but prices remain about as before. Potatoes are scarce and very few offering and prices are higher but whether present prices will show a profit to the shippers will depend largely on future supply if they continue scarce, present prices may be maintained. We think there is plenty potatoes in the country but farmers have an idea that they will be higher and are willing to take chances and if they continue present small deliverances may force prices still higher Pork is lower and market easy, supply was more than packers and shippers could take care of, consequently prices dropped fast and perhaps faster than they might have had the supply not been quite so heavy but still prices seem about high enough for packers who are now putting down stock for next summers trade. When we note that May pork is now selling in Chicago at about $16.00 per barrel, and if sellers there are right then prices must come lower here yet. Eggs are scarce and if it were not for storage eggs the shipment would be small indeed. Butter is easy Cheese is about all cleared up, 11 1-8 was price paid on last board, which was certainly quite high enough and we know of some not sold on the board which have not yet been placed although offered freely at board price. Vegetables of all kinds are plentiful and market well supplied.

The PUBLISHER'S DESK.

AT THE DOMINION EXHIBITION—Quite a number of firms who are well known to readers of the "Maritime Merchant" had very attractive exhibits at the Dominion Exhibition, which closed recently in St. John. One of the first to attract attention on entering the main building was that of T. H. Estabrooks, who had a very artistic booth with polite attendants, to serve Red Rose Tea and Coffee to all comers Needless to say it was always filled. MARITIME MERCHANT, Sept. 29.

ABSORBINE FOR THE TRAINERS—Absorbine is a general favorite among the trainers and is in constant use by them. Whenever they use a remedy for getting the horse in condition for the race, relieving inflammation of any kind, or treating bruises, swollen tendons, they apply Absorbine and the horse goes to the race sound. H. Scott Troup, Trainer, Foxboro, Ont., under the date of June 6th 1910 reported as follows; "I have used Absorbine off and on for 10 or 12 years, and if I were training a public stable would be using it now. I used it for leg and body wash and there is no better, I took off a Thoroughpin with it." Absorbine is a splendid preparation to use in case of Bog Spavin, Thoroughpin, Capped Hock, Swollen, Bruised Tendons, Splint, Curb, etc. At druggists $2 00 a bottle or sent direct upon receipt of price. Write for free booklet giving detailed information. W. F. Young, P. O. F., 124 Temple Street, Springfield, Mass, Canadian agents; Lymans, Ltd., St. Paul St., Montreal.

DO YOU STILL PAINT YOUR ROOF—Thousands of farmers will count the cost of painting their ready roofings as a necessary part of their annual expense. Many of them are making trouble for themselves in the future by laying roofs which require constant attention

There is a modern and better way of treating the roofing problem.

Amatite Roofing has come upon the market during the last few years and has proven a success, Amatite is like any other roofing (sold in rolls with nails and cement free, etc, ready to lay), except that it has a mineral surface which needs no painting. It is just as easy to lay Amatite as any other roofing and just as cheap. The difference is that after you have laid your Amatite roof, you can leave it alone. The mineral surface is thoroughly durable and requires no painting

If you do not know about Amatite, we advise you to investigate it. You can get a booklet about it and a free sample by simply addressing the nearest office of the Carritte-Patterson Mfg. Co., Ltd., St. John, N. B., Halifax, N. S.

LITERARY NOTE.—A book which indicates the chief characteristics of the most destructive plant diseases of Canada and the United States in a readily recognizable way and which at the same time describes the best methods for their prevention and cure, cannot fail to be of direct value to the students of agriculture and to farmers. Such a book is The Diseases of Economic Plants by Professors F. L. Stevens and J. G. Hall. The trouble with most previous books on plant diseases has been that instead of immediately attacking the most important phase—the characteristics of the diseases and the treatment—they devoted the major part to a discussion of causes. Now causes are all right. In fact the student should know what brings about a certain condition, but, at the same time, when a farmer sees his crop, whether it be wheat, vegetables or fruit, going to ruin his first anxiety is to know how to stop the devastation with the least possible delay Professors Steven and Hall realized this fully, with the result that they have put it to short, convenient paragraphs just the vital points about all of the most destructive diseases of plants, including those caused by cryptogamic parasites fungi, bacteria, slime moulds, parasitic flowering plants, animal parasites, insects worms, those due to adverse inaminate environmental conditions of light, water, soil, nutriment and phy iological diseases due to internal derangement. This classification of facts should prove a book to all who are growing things, doing away, as it does, with laborious reading and presenting just the needed advice.—THE MACMILLAN COMPANY OF CANADA, Limited 70 Bond Street, Toronto.

Care of the Soil.

The early fall is a most important time for the farmer to spend some thought and labor on the care and preparation of his soil for its succeeding csops. There are undoubtedly a great many farmers who still cling to the old idea that about all they need to expend in the operation of a farm is labor and money, but that is not so. Thought, intelligent and well directed thought, is often worth more than money, in carrying on the work of a farm.

And now is the time to think, perhaps abope all other things, if the thinking has not all been done before so that the farmer knows just what he is going to do with his land. The importance of fall working of land is being urged on the one hand and on the other the advantage of growing some kind of fall crop on the ground to preserve certain constituent elements of the soil for the use and benefit of productive crops next season.

The owner of a warm moist soil which perhaps would naturally lie idle and bare from late in the summer until th? next spring, needs to give some thought to the nitrates in the soil which may be lost without the right sort of care and handling of the soil. The decay of the organic matter in the soil forms nitrates which are absorbed by the growing crops. In warm moist soil this decay goes on after the crop has been removed duriog the late summer, and the nitrates are likely to be lost to a considerable extent as they are soluble in water and may be washed out of the soil. This is a reason why a fall crop of rye and vetch or barley and peas is useful, keeping the ground covered.

For Sale.

50 Acres Near State Capital.

Just a step to trolly line and large lake; 250 apple trees, variety other fruits, if taken at once a family cow, poultry, hog, wagons, farming tools, etc, as well as crops for winter use will all be included for only $2 400, part cash, for picture of attractive buildings, all details and travelling instructions, see page 2, "Strouts Biggest Farm Bargains," copy free, E. "Hello Neighbor!"

LET us send you the detailed and specific information about the organization and operation of a Telephone System in your own community. You know the advantages of the Farm Telephone and there is no need of our going into that part of it. What you want to know now is—"How can I get the thing going?"

OUR FREE BOOK

on "How to Build Rural Telephone Lines" is free to you for the asking and contains a story that is of vital interest to every farmer—an intelligently written story of all that the title of the book implies. This book also tells about our No. 1317 Type Telephone Set, specially designed for Rural Telephone work by the most expert telephone engineers on this continent. This set is the acme of telephone construction. Just ask us to send Bulletin No. 140. It is free.

NOW IS THE TIME.

to get busy. After you have read this book, you can go right ahead in your own community and, with all the essential facts about farm telephones fixed in mind, you can organize a subscriber owned and controlled telephone system among your own friends and neighbors. The answer to every question that you will be asked is in this book. You will be the man referred to for the facts and the book will enable you to answer and give definite information. You will be able to organize a telephone company that will be as successful as any of the hundreds of other co-operative farmer's telephone companies doing business in Canada to-day.

Remember, it doesn't cost you a single cent to acquire this information—we are ready to send it to you **free** for the asking. Write for it now while you are thinking about it.

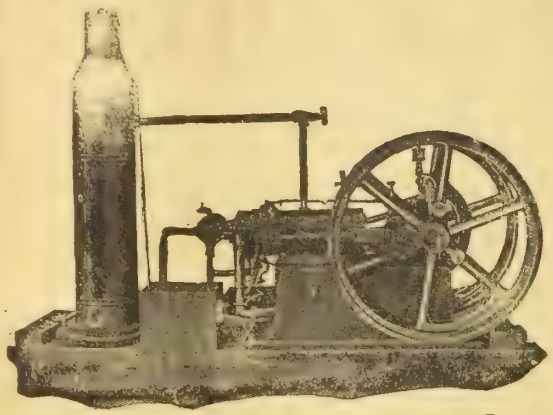
Farmers of Quality



Stationary and Mounted, in 1 1-2 to 30 Horse Power

Want Quality !

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the "**Ideal**" is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of seating directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinder head, so that when the valves become worn, the valve cage and valve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn, you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer.

"**Ideal**" **Gas and Gasoline Engines** are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price.

Tenth Annual
Maritime Winter Fair
AMHERST, N. S.

December 5th, 6th, 7th and 8th.

Increased Prize List ! Extra Specials !

Judging Competitions for Men, Women, Boys and Girls.

The Greatest Live Stock and Educational Fair in Eastern Canada.

Special Fares on all Lines.

F. L. FULLER, = = = = Secretary-Manager.

You Can Furnish Your Home FREE!

ANY housewife buying goods at the stores mentioned below may have their cash purchases apply on Asepto Soap Premiums. Every cent you spend counts toward a premium. A sure and mighty convenient way to save without increasing living expenses. Over 300 premiums of honest value to select from. The list will be increased every few weeks. Furniture will be offered next. The old way was to allow premiums to apply on Soap Wrappers only. Now at any of these stores—no matter what you buy—everything ha its equivalent in Soap Wrappers. That is every five cents spent counts the same as one wrapper, while purchases of our goods as her s e advertised entitles you to two coupons—the one the merchant allows and the ones found in or on our goods themselves.

Dr. White's Honey Balm.—A cough syrup that is safe and sure. We are positive that no other cough syrup equals it. Price 25c. Equal to 5 soap wrappers.

Pendleton's Panacea.—The best hot medicine, in use nearly 100 years. Every person knows it is good. Price 25. Equal to 5 soap wrappers.

Brown's Cutilive.—A witch-azel cream for chapped hands, sunburn, etc. Price 25c. Equals 5 soap wrappers.

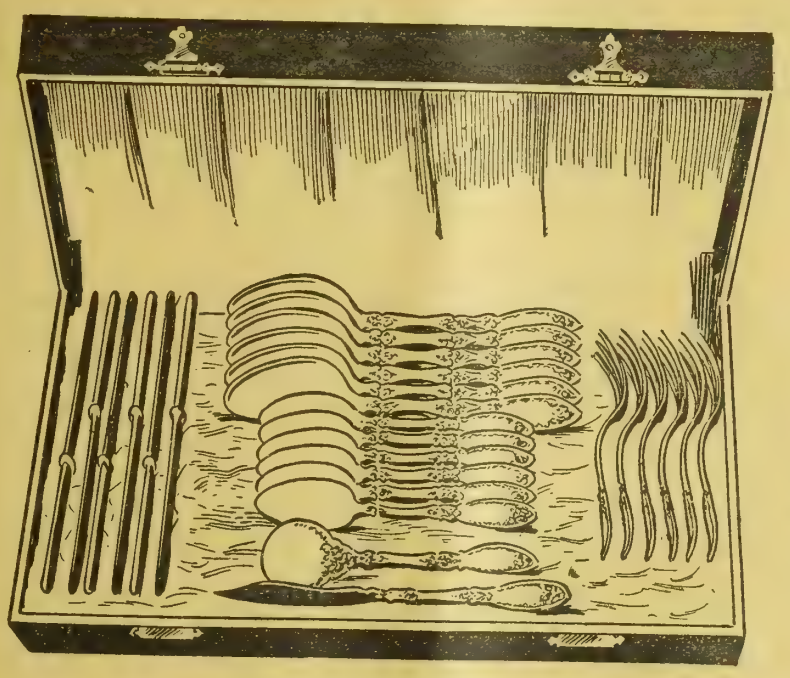
Scott's.—Salts, Senna, Sulphur, Saltpetre, Borax and Alum in 5c packages. Equal to 1 soap wrapper.

Brown's Spearmint Tooth Paste.—Sweetens the breath, prevents decay, hardens the gums and whitens the teeth. Price 25c. Equals 5 soap wrappers.

Naptha Soap.—A pure laundry soap, containing naptha and incorporated by a process that prevents it from hurting the hands, as other Naptha Soaps do. The wrappers count for premiums.

Sapid Tea.—A blend selling at 40c, in 1 lb. packages only. Blended by J. Harvey Brown, one of the most competent tea men in Canada. Each package carries a coupon equal to 8 soap wrappers.

Dr. Scott's White Liniment.—The largest bottle and best liniment. Price 25c. Equal to 5 soap wrappers.



Banner Flavoring Extracts.—All flavors and from 10c to $1.25 per bottle. Coupon on each bottle.

Herner's Dyspepsia Cure.—The only kind that tells you to eat what you like while taking it. Money back if not good. Price 35c. Equal to 7 soap wrappers. Price $1.00. Equal to 20 soap wrappers.

Brown's Stomach and Liver Pills.—A good family pill. Price 25c. Equals 5 soap wrappers.

Scott's Furniture Polish.—Renews the life of old furniture. Price 25c. Equals 5 soap wrappers.

Asepto Soap.—Is equal to the best and contains the same antiseptic features that Asepto Soap Powder does. The wrappers count for premiums.

Scott's.—Nitre, Glycerine, Iodine, Iron, Squills, Friar's Balsam, Carbolated Oil, Camphorated Oil, Castor Oil, Sweet Oil, Oil of Tar, Sewing Machine Oil, Spirits of Camphor. Price 10c per bottle. Equal to 2 soap wrappers.

Scott's Fruit Syrups and Lime Juice.—Pure and excellent flavor. 10c, 15c and 25c. Coupon on the bottle.

Ebony Polishes—None better, bothpaste and lustre. Coupon on each box. Try them.

Banner Spices.—In packages only. Absolutely pure. ¼ lb. packages carry coupon equal to 2 soap wrappers.

Venus Floating Soap.—Made from pure vegetable oils and unexcelled for the toilet and bath. Price 25c. Coupon counts for premiums.

Asepto Soap Powder.—Has been the greatest success of any soap or powder ever put on the market. This is the best evidence of its quality. It is antiseptic as well. It absolutely sterilizes every article washed. Think what this means to a family. Price 5c, and the trade mark counts for premiums.

The following stores are now in a position to explain to you what this offer means :—McLeod & Spence, Port Elgin, N. B.; F. L. Rayworth, Bayfield, N. B.; W. H. Chapman, Northport and Amherst Shore, N. S.; The Sussex Mercantile Co., Ltd., Sussex, Petitcodiac Penobsquis, Elgin and Havelock, N. B.; R. G. Innis, Norton, N. B.; W. H. Martin, Waterside, N. B.; F. C. Fillimore, Riverside, N. B.; M. L. Thorne, Cody's, N. B.; J. S. Robinson, Narrows, N. B.; H. G. Turnbull, Digby, N. S. Others are being added continually. If your dealer has not got coupons see that he gets them.

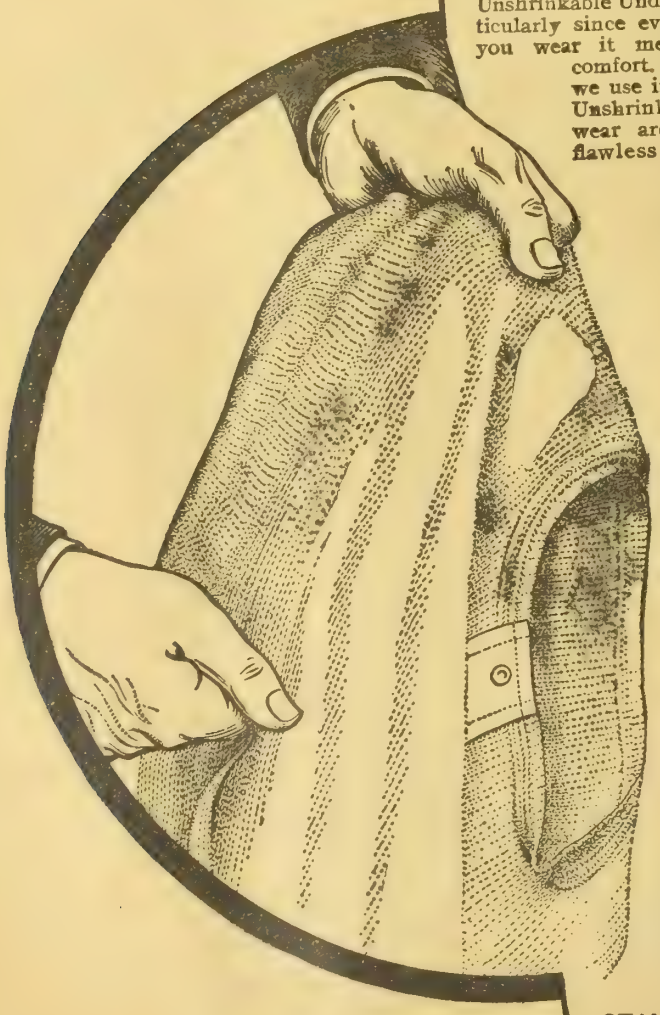
VANCOUVER WINNIPEG

If it offers you an extra season's wear, surely it's worth while insisting on Stanfield's Unshrinkable Underwear! Particularly since every moment you wear it means perfect comfort. The yarns we use in Stanfield's Unshrinkable Underwear are virtually flawless — spun so carefully that not a yard escapes our spinners' critical eyes. Then, patented, ingenious machines knit these fine yarns into a wonderfully elastic fabric that yields gently to the slightest movement of your body yet stubbornly resists wear. Every stitch in the knitting is locked—so ravelling is impossible.



Yielding, Elastic; yet Strong to Wear.

STANFIELD'S Unshrinkable UNDERWEAR

Made both for women and for men in perfectly fitting sizes. Twenty-one different weights and qualities:—from warm, heavy ribbed garments particularly suitable for outdoor workers to the soft, finely knitted underwear so soothing to sensitive skins. Your local dealer sells Stanfield's Unshrinkable Underwear. Catalog on request.

Volume 16. Sussex, N. B., November 22, 1910. Number 4.

The Canadian Record of Performance for Pure Bred Dairy Cattle Report No. 2.

SINCE Report No. 1 of the Record of Performance was issued in 1908, the work has grown materially. Whereas all the animals whose records are published in Report No. 1 were owned in Ontario and Quebec, yearly testing is now going on in all the provinces except Manitoba and Saskatchewan, although few have yet qualified for registration in the outlying provinces. A review of this report will show that Ayrshire, Holstein, French Canadian, and Jersey cows have qualified and their records have been registered. A number of Guernseys are under test but have not completed a year's work.

The Three-year-old Ayrshire Cow Class at the Halifax Exhibition

There were eleven entries in this class but Judge Stephen picked out the best seven cows and sent the remainder back to their stalls. Judge Stephen may be seen in the foreground picking the winners.

Up to March 31, 1910, 1,081 cows had been entered for the test, made up as follows: Ayrshires, 572; Holsteins, 421; French Canadians, 58; Jerseys, 17; and Guernseys, 13. Up to date, 181 have qualified for registration, and a large number are still under test.

THE VALUE OF THE YEARLY TEST.

The value of tests for full milking periods of cows that are to be kept for breeding is being more and more appreciated. Ever since stock breeding has been carried on in a systematic way it has been well understood that qualities or characteristics of parents are perpetuated in the offspring. For many generations this law was applied to the perpetuation of form and external markings. It is now recognized that a cow may be ever so perfect in form and color but unless she can return a profit in milk far the food she consumes, she fails to possess practical value. It is to accentuate and perpetuate the quality of heavy and rich milk giving by the year while producing a calf annually, that the Record of Performance test is applied to cows of the pure breeds. That Canadian breeders appreciate the value of this work is shown by the increasing number of cows under test and the advanced market value of cows registered on production as also of their offspring and other related animals. An appreciation of this has extended to Scotland, the home of Ayrshire breed, where a system of testing herds for full milking periods has been very generally adopted. A herd which has been under test for a number of years and which has been built up accordingly has been compared by a correspondent of the Scottish Farmer with an untested herd. The owner of the former by selecting his bulls from good milking cows, and disposing of his poorest producers, has brought his herd up to an average production in 1909 of 900 gallons per cow, in an average lactation period of forty-two weeks. That, at 13½ cents per gallon, gives a return of about $125 per cow for milk. The owner of the other herd, following the old methods of selecting bulls that pleased his eye from cows of good form and having 'show' udders, obtains an average of only 440 gallons of milk per cow in an average lactation period of forty-two weeks. This at 13½ cents per gallon gives a return of about $60 per cow,

A Pair of Typical Prize-Winning Shorthorns

Owned and bred by C. A. Archibald, Bellevue Farm, Truro, N. S.

or about one-half the value of the product of the other herd. It is stated that the cost of feeding the two herds per head was about equal, amounting during the winter months to abut 22 cents per cow per day.

The system of yearly tests as compared with seven day, or even thirty day tests, has enormous advantages. Records for the shorter periods are too often spurt records made under forced conditions following a careful and often expensive system of preparation. Discussing this question in Hoard's Dairyman, Prof. Eckles of Missouri Agri. College puts it thus:—

1. A seven-day test is too short to give a fair estimate of the production of a cow for a year.

2. Preparing cows for seven-day tests by long dry periods before calving, and selecting breeding animals on the basis of seven-day records tends towards developing cows that will milk heavily for a short time but will not be persistent.

3. A seven-day test, as carried on by the most skillful breeders, results in an abnormally high percent of fat.

Prof. Eckles arrives at his conclusion after a thorough investigation of the subject with cows in tne Agricultural College. In tables, he shows that highly fitted cows gave abnormally high fat tests for seven days high tests for two or three weeks, soon afterwards coming to their normal, or average, test for the year. One cow, referred to, coming in after a normal rest and moderate feeding, gave on the sixth day, milk testing 2.8 per cent fat which was her average for her full milking period. The following year she was rested three months and fattened to weigh some 300 pounds above her normal weight. After calving, her milk on the 3rd day tested 5.67 per cent, 6th day 4.13 per cent, and on the 17th day 2.8 per cent, which was the same as she gave on the 17th day after calving the previous year. Concluding his article Prof. Eckles says:—

Breeders in general should be in possession of the facts as to how these high per cents. of fat are obtained in order that all may have an equal chance to make such records, and also that too great importance will not be attached, in selecting breeding animals, to the facts that some ancestors has shown a high per cent of fat in a seven-day test.

It might be pointed out that the observations of Prof. Eckles are borne out in the work of the Record of Performance. Occasionally a cow, at her first test after calving gives milk richer in fat than her average for the year, but in practically every such case the cow has calved in an unusually high condition of flesh and after a lengthy period of rest. It is for this reason that breeders are encouraged to continue testing the same cows year after year as in this way the actual yielding powers of cows kept under normal conditions cows kept under normal conditions of breeding and feeding are ascertained.

In addition to the records of cows that have qualified by reason of

production and breeding for registration in the Canadian Record of Performance, there are also given in this report, the records of two bulls that have fulfilled the requirements for registration in having four daughters in the Record of Performance each from a different dam.

RULES AND REGULATIONS.

Following are the rules and regulations governing the Record of Performance tests:—

SCOPE OF TESTS.—All tests will be for a period not exceeding 365 consecutive days.

ELIGIBILITY OF ANIMALS.— All animals entered for the test must previously registered in the Canadian Herd Book, for the breed to which they belong.

CLASSIFICATION OF ANIMALS.—Cows from 2 to 3 years old shall be in a class known as 2-year-old. Cows from 3 to 4 years old shall be in a class known as 3-year-old. Cows from 4 to 5 years old shall be in a class known as 4-year-old. Cows five years old and over shall be in a class known as mature.

In the 4-year-old class and the mature class, no cow will be excepted for entry if the beginning of her previous lactation period was more than fifteen months before the commencement of the test. Every cow under test must drop a calf within fifteen months after the beginning of her testing period, in order to qualify for registration of performance.

No milk from a second freshening within the 365 days will be considered in a test.

DUTIES OF OWNER.—It is desirable that entries of cows for test be made before calving. In no case will entries be accepted if not mailed within thirty days after calving.

The owner of a cow entered in the test shall weigh, or cause to be weighed, each milking and keep a correct record of the same on forms furnished for the purpose.

At the end of each month the owner shall report on forms furnished for the purpose:—

(a) A record of the weights of each milking, with the total yield of milk from each cow for the month.

(b) An approximate statement of the amount and kinds of feed given, and data concerning stabling and care given the animals.

NOTE.—Monthly reports should be mailed within ten days after each monthly period. Such reports must reach the office of the Live Stock Commissioner before the end of the succeeding month.

At the end of the year the owner shall send on forms furnished for the purpose, a compiled report of the year's milk record taken from the monthly reports and sworn to before a notary public or justice of the peace.

The owner of a cow entered in the test shall provide board and lodging for the inspector during his official visits and shall convey him, when leaving, to the railway station, or the next farm, to be visited free of charge.

DUTIES OF INSPECTORS. — An inspector will visit the stable at least eight times during the year, at irregular intervals and unannounced. He shall remain for at least two full days, covering all the milkings of that period, at each visit. During this time he shall weigh the milk of each cow under test, at each milking and take samples of each for composite sample for a Babcock test. These tests shall be the basis for computing the record. He shall see that the samples are in no manner interferred with; when not under the inspector's eye the samples must be under lock and key or sealed. The inspector may insist upon only one of the animals under test being milked at a time during inspection.

The inspector shall take a copy of the owner's milk record for the two days immediately preceding his visit. Dates of calving, service, etc., must be recorded by him. As complete a statement as possible of the feed given should be reported. And sickness of cows and other disturbing influences should be noted. If such sickness of an animal should occur at the time of a visit the inspector may defer the test of this animal to another date.

The inspector must send to the Live Stock Commissioner, Ottawa, as soon as possible after each visit, a report of said visit on forms furnished for the purpose.

A report of the performance of each animal will be forwarded to the Secretary of the Canadian Association representing the breed at the conclusion of the testing period.

The Dominion Department of Agriculture undertakes the supervision of these yearly tests of cows only through the various breed associations. Only such cows will be tested as are of the breeds, whose respective associations have officially recognized the tests as outlined, and have agreed to publish in connection with their Herd Book the records of the animals fulfilling the standards required.

APPLICATION FOR TEST.— Application for the test should be made before calving and must be mailed within thirty days after calving to the secretary of the Canadian Association for the breeds to which the animal belongs, and accepted by him as eligible.

Upon receipt of said application, signed by said secretary, the Live Stock Commissioner will forward to the address of the applicant blank forms and other information and arrange for official inspection.

The above rules and requirements are subject to change at the discretion of the Minister of Agriculture.

J. G. RUTHERFORD,
Live Stock Commissioner.

The Sweetest Foal on the Grounds.

First prize Hackney foal at the Dominion Exhibition, St. John, N. B. Sire, Lucifer; dam, Cymbal. Owned by T. B. McAulay, Hudson Heights, Que.

THE STANDARDS FOR REGISTRATION.

AYRSHIRE.—Bulls—Admitted after having four daughters in the Record of Performance, each from a different dam.

Cows—Admitted after fulfilling the following requirements of production and breeding as supervised by the Live Stock Branch of the Department of Agriculture.

All cows admitted must equal or exceed both the records specified below:—

	Lbs. Milk	Lbs. B Fat
Two-year-old class	5,500	198
Three-year-old class ...	6,500	234
Four-year-old class	7,500	270
Mature class	8,500	306

The per cent of butter fat shall be determined by Babcock test.

Year's Milk Record—If the test be commenced the day the animal is two years old or previous to that day, she must produce within 365 consecutive days from the date, 5,500 pounds of milk. For each day the animal is over two years old at the beginning of her year's test, the amount of milk she will be required to produce in the year will be determined by adding 2.75 pounds for each such day to the 5,500 pounds required when in the two-year-old class. This ratio is applicable until the animal is five years old, when the required amount will have reached 8,500 pounds which will be the minimum amount of milk required of all cows five years and over.

Year's Butter Fat Record—If test be commenced the day the animal is two years old, or previous to that day, she must produce within 365 consecutive days from that date, 198 pounds of butter fat. For each day the animal is over two years old at the beginning of her year's test, the amount of butter fat she will be required to produce in one year will be determined by adding .1 (one tenth) of a pound for each such day to the 198 pounds required when in the two-year-old class. This ratio is applicable until the animal is five years old when the required amount will have reached 306 pounds, which will be the minimum amount of butter fat required of all cows five years old and over.

Every cow accepted for registration of performance must drop a calf within fifteen months after the commencement of the test. In the four-year-old class and the mature class, no cow will be accepted for registration of performance if the beginning of her previous lactation period was more than fifteen months before the commencement of the test.

All applications for the test must be mailed to W. F. Stephen, Huntingdon, Quebec, secretary of the Canadian Ayrshire Breeders' Association.

FRENCH CANADIAN—Bulls— Admitted after having four daughters in the Record of Performance, each from a different dam.

Cows—Admitted after fulfilling the following requirements of production and breeding as supervised by the Live Stock Branch of the Department of Agriculture.

All cows admitted must equal or exceed both the records specified below:—

	Lbs. Milk	Lbs. B Fat
Two-year-old class	4,400	198
Three-year-old class	5,200	234
Four-year-old class	6,000	270
Mature class	6,800	306

The per cent of butter fat shall be determined by Babcock test.

Year's Milk Record—If the test be commenced the day the animal is two years old or previods to that day, she must produce within 365 consecutive days from that date 4,400 pounds of milk. For each day the animal is over two years old at the beginning of her year's test, the amount of milk she will be required to produce in the year will be determined by adding 2.2 pounds for each day to the 4,400 pounds required when in the two-year-old class. This ratio is applicable until the animal is five years old, when the required amount will have reached 6,800 pounds which will be the minimum amount of milk required of all cows five years old and over.

Year's Butter Fat Record—If test be commenced the day the animal is two years old or previous to that day, she must produce within 365 consecutive days from that date, 198 pounds of butter fat. For each day the animal is over two years old at the beginning of her year's test, the amount of butter fat she will be required to produce in one year will be determined by adding .1 (one-tenth)

First Prize Devon Herd at the Halifax Exhibition.

Owned by Wm. A. Pinkney, Melbourne, N. S.

of a pound for each such day to the 198 pounds required when in the two-year-old class. This ratio is applicable until the animal is five years old when the required amount will have reached 306 pounds, which will be the minimum amount of butter fat required of all cows five years old and over.

Every cow accepted for registration of performance must drop a calf within fifteen months after the commencement of the test. In the four-year-old class and the mature class, no cow will be accepted for registration of performance if the beginning of her previous lactation period was more than fifteen months before the commencement of the test.

All applications for the test must be mailed to Dr. J. A. Couture, 49 Garden St., Quebec, secretary of the French-Canadian Cattle Breeders' Association.

GUERNSEY.—Bulls—Admitted after having four daughters in the Record of Performance, each from a different dam.

Cows—Admitted after fulfilling requirements of production and breeding as supervised by the Live Stock Branch of the Department of Agriculture.

All cows admitted must equal or exceed both the records specified below:—

	Lbs. Milk	Lbs. B Fat
Two-year-old class	5,000	200
Three-year-old class	6,000	240
Four-year-old class	7,000	320
Mature class	8,000	320

The per cent of butter fat shall be determined by Babcock test.

Year's Milk Record—If test be commenced the day the animal is two year old, or previous to that date, she must produce within 365 consecutive days from that date, 5,000 lbs. of milk. For each day the animal is over two years old at the beginning of her year's test, the amount of milk she will be required to produce in the year will be determined by adding 2.75 lbs. for each such day to the 5,000 lbs. required when in the two-year-old class. This ratio is applicable until the animal is five years old, when the required amount will have reached 8,000 lbs., determined by adding .11 (eleven one-of milk required of all cows five years old or over.

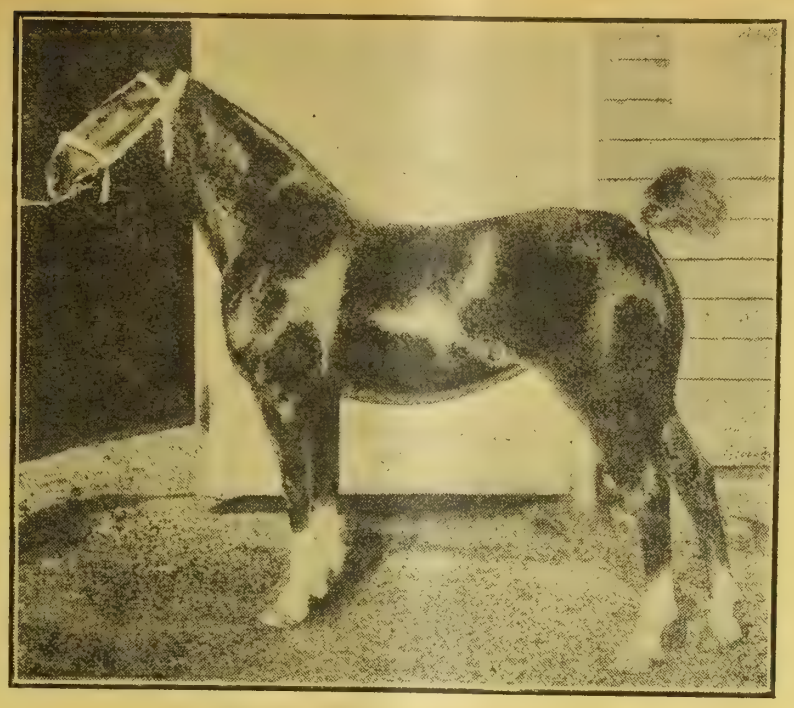
Year's Butter Fat Record.—If test be commenced the day the animal is two years old or previous to that day, she must produce within 365 consecutive days from that date, 200 lbs. of butter fat. For each day the animal is over two years old at the beginning of her year's test, the amount of butter fat she will be required to produce in one year will be determinedby adding .11 (eleven one-hundredth) of a pound for each such day to the 200 lbs. required when in the two-year-old class when the required amount will have reached 320 lbs. which will be the minimum amount of butter fat required of all cows five years old and aver.

Every cow accepted for registration of performance must drop a calf within fifteen months after the commencement of the test. In the four-year-old class and the mature class, no cow will be accepted for registration of performance if the beginning of her previous lactation period was more than fifteen months before the commencement of the test.

All applications for the test must be mailed to Howard W. Corning, Chegoggin, N. S., secretary of the Canadian Guernsey Breeders' Associatioo.

HOLSTEIN-FRIESIAN — Bulls — Admitted after having four daughters in the Record of Performance, each from a different dam.

Cows—Admitted after fulfilling the following requirements of production and breeding as supervised by the



Lucifer by Copper King.
Champion Hackney stallion at the Dominion Exhibition, St. John, N. B. Owned by T. B. McAulay, Hudson Heights, Que,

Live Stock Branch of the Department of Agriculture.

All cows admitted must equal or exceed both the records specified below:—

	Milk Lbs.	B Fat Lbs.
Two-year-old class	7,500	255
Three-year-old class	8,500	289
Four-year-old class	9,500	323
Mature class	10,500	357

The per cent of butter fat shall be determined by Babcock test.

Year's Milk Record—If the test be commenced the day the animal is two years old, or previous to that day, she must produce within 365 consecutive days from that date 7,500 lbs. of milk. For each day the animal is over two years old at the beginning of her year's test the amount of milk she will be required to produce in the year will be determined by adding 2.75 lbs. for each such day to the 7,500 lbs. required when in the two-year-old class. The ratio is applicable until the animal is five years old, when the required amount will have reached 10,500 lbs., which will be the minimum amount of milk required of all cows five years old or over.

Year's Butter Fat Record—If the test be commenced the day the animal is two years old or previous to that day, she must produce within 365 consecutive days from that date, 255 lbs. of butter fat. For each day the animal is over two years old at the beginning of her year's test, the amount of butter fat she will be required to produce in one year will be determined by adding .0931 of a lb. for each day to the 255 lbs. required when in the 2-year-old class. This ratio is applicable until the animal is five years old when the required amount will have reached 357 lbs., which will be the minimum amount of butter fat required of all cows five years old and over.

Every cow accepted for registration of performance must drop a calf within fifteen months after the commencement of the test. In the four-year-old class and the mature class, no cow will be accepted for registration of performance if the beginning of her previous lactation period was more than fifteen months before the commencement of the test.

All applicatians for the test must be mailed to G. W. Clemons, St. George, Ont., secretary of the Canadian Holstein-Friesian Breeders' Association.

JERSEY--Bulls--Admitted after having four daughters in the Record of Performance, each from a different dam.

Cows—Admitted after fulfilling the following requirements of production and breeding as supervised by the Live Stock Branch of the Department of Agriculture.

All cows admitted must equal or exceed both the records specified below:—

	Lbs. Milk	Lbs. B Fat
Two-year-old class	5,500	218
Three-year-old class	6,500	257
Four-year-old class	7,500	297
Mature class	8,500	337

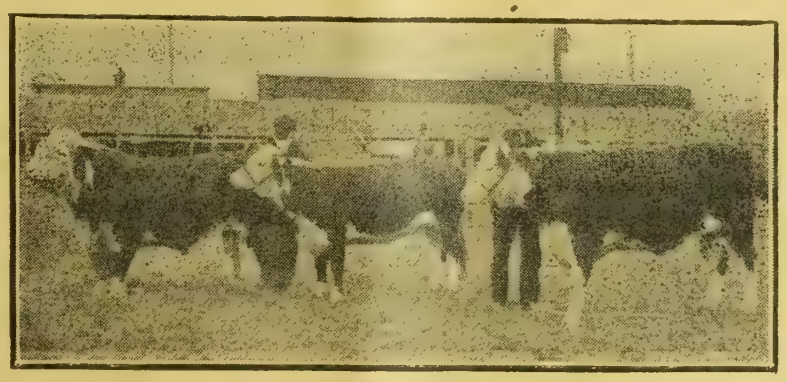
The per cent of butter fat shall be determined by Babcock test.

Year's Milk Record—If test be commenced the day the animal is two years old, or previous to that day, she must produce within 365 consecutive days from that date, 5,500 lbs. of milk. For each day the animal is over two years old at the beginning of her year's test, the amount of milk she will be required to produce in the year will be determined by adding 2.75 lbs., for each such day to the 5,500 lbs., required when in the two-year-old clas. This ratio is applicable until the animal is five years old, when the required amount will have reached 8,500 lbs., which will be the minimum amount of milk required of all cows five years old or over.

Year's Butter Fat Record—If test be commenced the day the animal is two years old or previous to that day, she must produce within 365 consecutive days from that date, 218 lbs., of butter fat. For each day the animal is over two years old at the beginning of her year's test the amount of butter fat she will be required to produce in one year will be determined by adding .11 (eleven one-hundredth) of a pound for each such day to 218 lbs., required when in the two-year-old class when the required amount will have reached 337 lbs., which will be the minimum amount of butter fat required of all cows five years old or over.

Every cow accepted for registration of performance must drop a calf within fifteen months after the commencement of the test. In the four-year-old class and the mature class, no cow will be accepted for registration of performance if the beginning of her previous lactation period was more than fifteen months before the commencement of the test.

All applications for the test must be mailed to R. Reid, Berlin, Ont., secretary of the Canadian Jersey Cattle Club.



A Trio of Prize Winning Herefords.
Owned and bred by W. W. Black, Amherst, N. S.

Draining Land by Tile—Profitable Investment.

Nearly every farm in the country contains more or less low land which is unproductive and of little value to the owner, but which, by the investment of a small amount of money, could be made more valuable for raising crops by simply ridding it of the surplus water with which it is saturated.

A thorough system of tile drainage will prevent any possible damage from heavy rains or floods. It will enable the farmer to work lands immediately after rains. It lengthens the season for labor and vegetation by rendering the soil earlier in the spring and keeping off the effects of cold weather longer in the fall. It deepens the surface soil, and prevents surface-washing by drawing the water down through the soil as fast as it falls, and thus the land gets the benefit of whatever fertilizing material it contains, and the soil, being open and porous, receives a large supply of the fertilizing gases of the atmosphere. It prevents land from becoming sour, and, drawing off the stagnant water, the plant receives the life-giving air and warmth. It lessens the formation of a hurtful crust on the surface after rains in hot weather. It assures the farmer a certain return for his labor. From an eminent work on drainage, by Colonel Waring, we quote:

"If a rule for drainage could be had which would cover all the varied circumstances of different soils, it would be somewhat as follows: All lands, of whatever texture or kind, in which the spaces between the particles of soil are filled with water (whether from spring or rain) within less than four feet of the surface of the ground, except during and immediately after heavy rains, require draining. Of course, the particles of the soil cannot be made dry, nor should they be; but, although they should be moist themselves, they should be surrounded with air, not water."

Where the soil is undrained the roots of the plant are kept near the top of the ground by the water-line. The plant having a shallow hold in the ground, soon withers

and becomes feeble. Where the soil is drained, the roots of the plant have a chance to spread out, seek nourishment, obtain a firm hold in the ground and thus will show a healthy growth.

Every farmer is aware that a deep soil is better than a shallow one. The roots of plants will not grow in the water. Hence, when the field has a shallow or thin soil, with the water near the surface, the roots have but a shallow feeding ground, and cannot descend to the depth necessary to obtain the food that will insure hardy growth. As far down as the tiles are laid the ground is a storehouse for the necessary supply of food for the growing crops. The water passing through the ground to the drain is followed by the air loaded with the fertilizing particles, which are absorbed by the soil and furnish food to the roots.

The uncertainty of crops to the farmer who has undrained land is a constant source of anxiety. He must wait until the season is well advanced before he can plow. After planting, he is always watching the weather. If it is wet, and the land becomes cold, the seed will rot. If pleasant and the seed germinates and the plants appear, frequent rains may render the land so wet that he cannot cultivate it, and the crops will be injured. Or, if the latter part of the season be dry, the land will become hard, and the result to the crop is the same.

The farmer who cultivates land which is thoroughly underdrained can break it a week or ten days earlier in the spring. The soil is loose and friable and he can plant fully ten days earlier, with a positive certainty that the seed if good, will germinate. He can cultivate sooner, and with a third less labor to both man and beast—can be stirring the soil within twenty-four hours after a heavy rainfall. The soil is warmer and promotes the more rapid growth of the crop, and is less liable to damages from late frosts in the spring or early frosts in autumn, practically lengthening the season for growth and maturity fully thirty days; or if the weather should be dry, the roots, descending deep into the earth, bring up moisture from below, producing an abundant yield.

Whether the season be wet or dry, the farmer on drained land has a certainty of an abundant yield that enables him to mature his plants without a liability of failure.

The experience of those who have adopted a system of tile drainage has been that a profit of 25 to 100 per cent has been realized, and that the increased profit for one season will repay the entire cost of thoroughly draining a tract of land. And, again, the land so drained will every year produce a heavier crop and at far less expense than will the undrained land in the most favorable season. Soils underlaid with clay, if undrained, will average fully one-third increase of product, in many instances more than double the product, and in many cases it insures an abundant yield where little if anything could be grown before.

We would ask the farmer to look at this as an investment. What investment on the farm will pay him as well? And why not commence the work at once?

To find the number of rods and the quantity of tile to the acre, multiply 33 by 80, divide by distance between the drains, and the product will be the number of rods to a given distance.

QUANTITY OF TILE REQUIRED PER ACRE.

Distance between Drains	No. Rods in Acre	No. Tiles
At 20 feet apart	132	2,112
At 25 feet apart	105½	1,688
At 30 feet apart	88	1,400
At 35 feet apart	76	1,146
At 40 feet apart	66	1,056
At 45 feet apart	58½	878
At 50 feet apart	52½	844
At 55 feet apart	47	705
At 60 feet apart	44	630

We take it for granted that a few suggestions as to the form and quality of tile best suited to the purpose may not be out of place. First, as to form, the round tiles are undoubtedly the best, because they can be laid any side up, and thus a close joint can be secured with much less trouble than with flat bottom or octagon tile, especially if a little out of shape.

As to quality, tile should be made of good tile clay. Such tile are of unusual strength, which materially reduces the breakage and expense of transportation.

Too much stress cannot be laid upon the importance of using hard burnt tile only, as the failure of a single tile may work extensive mischief. Tile should be smooth on the inside, as the friction will be less. The old fashioned notion that drain tile should be porous in order to absorb the water was an error. The water enters the drain at the joints, and nowhere else to any appreciable extent.

The tile made of common brick clay at various places throughout the country is a good deal better than nothing; but when good, solid, hard burned tile, made of good tile clay can be obtained at about the same price, it is a great mistake to use the soft, porous tile. The farmer cannot afford to use inferior tile; he wants only what is reliable and will be of permanent value.

In the beginning of drainage the work should be carefully laid out, the inclination marked on grade stakes, and the whole should be platted and carefully preserved for future reference. If it is not possible to complete the work soon, let it be so done as to look forward to the time when it shall be completed.

In laying a tile drain it is well to strictly adhere to the following rules The drain should have a sufficient outlet for the discharge of all the water that may pass through it. The drain should be deep enough to drain the widest space possible—from three to four feet—and deeper, if neceasary to get the water out by a much shorter line; but drain anyway, even if you cannot get an outlet to drain so deep. The bottom of the drain should be one regular line of descent, so that the current may have a smooth flow from the head to the mouth of the drain. Every tile should be perfect in form and well burned, having a clear metallic ring. In laying the tile, take pains to fit the joints about one-sixteenth of an inch apart, so as to let the water in freely. When the tiles are so fitted and become wet they will swell a trifle longer and will close up the sixteenth of an inch allowed. At the junction of drains the water should be brought together, flowing as nearly as possible in the same direction, so that the flow of the current may not be obstructed. The size of the tile may be pretty accurately determined by the amount of surface to be drained and the descent of the drain, by reference to the tables given herewith. Tile smaller than three inches in diameter should not be used, and drains constructed with tile of that size should not exceed 500 feet in length.

1 inch	3,630	27,154

Drain your land, for it will make you money. Use drain tile in wet Drain your dry land it will make you 50 per cent. Drain your wet wheat land. Drain your orchards. Drain your hop yards.

Drain tile takes off surface water; you can put in your crop earlier in the spring.

Your crop won't drown out in the winter time, for the drain tile will take the water off.

Your crop won't dry out in the summer, because the drain tile will keep your ground moist. There is a circulation of air going through the circulation of air going through the tile and out through the soil that makes it porous and loose like honey comb, and it holds moisture; it will make the soil 10 degrees warmer.

Put in your tile not less than three feet deep, four feet is better; the deeper you put them the farther apart you can lay your tile, the farther the tile will draw the water, and the less tile it will require to tile your land, and a better result you will get from your tile. If you lay your tile but fifteen or twenty inches deep you cannot get good results, for you cannot expect the water to come up out of the ground and run out in the tile. The tile has got to be down a sufficient depth so that the surface water can go down in the tile and run off.

Draining is a permanent improvement and when properly done will last for ages. You should be careful to do it right. Be sure and buy the best drain tile, for it will be cheaper in the end, and poor tile will prove dear at any price.—J. E. Murphy in Better Fruit.

Report of Committe on Dissemination of Bovine Tuberculosis.

The sub-committee on the dissemination of bovine tuberculosis respectfully submits the appended report on the means for the dissemination of this disease, based on the present knowledge of the life history of the tubercle bacillus. The possible means for the dissemination of this disease are enumerated as follows:

1. The introduction into a sound herd of an animal or animals affected with tuberculosis (a) those with open tuberculosis, (b) those in which the disease is in a period of incubation and (c) those in which the lesions are temporarily arrested.

The last group will not transmit the infection speedily and possibly may never do so. The first group is certain to spread the virus.

2. By feeding calves milk, whole or separated, buttermilk or whey, where the milk has come from tuberculous cows.

3. By bringing cattle suffering from open tuberculosis in contact

with healthy ones at fairs, cattle shows and other exhibitions.

4. By shipping healthy cattle in cars not thoroughly disinfected, recently occupied by tuberculous cattle.

5. By placing healthy cattle in stables that have not been thoroughly disinfected and which were recently occupied by tuberculous animals, as frequently happens with the change of farm ownership or tenants.

6. Tuberculous animals which do not react to tuberculin, such as those in the period of incubation or latent cases, but which develop active tuberculosis later, are frequently carriers of the virus although bought and sold as sound animals. These can not at present be differentiated from sound animals. Therefore all cattle coming from herds in which the disease exists should be considered as suspicious. The sound herd is the unit to deal with.

7. Tubercle bacilli may be transmitted by tuberculous cattle running in a pasture to healthy cattle in adjoining pasture where they are separated by a fence of such nature that the cattle may get their noses together.

8. Tuberculosis in cattle rarely; if ever, occurs through infection from (a) a man, either directly or as a carrier of bovine tubercle bacilli, (b) from other species of animals, or (c) by infection from the droppings of crows, buzzards or other birds or carnivorous animals that have fed upon the carcasses of tuberculous cattle. It is the opinion of this committee that bovine tuberculosis is spread largely through the introduction of tuberculous cattie into sound herds; by the feeding of calves with infected milk, or milk products; by exposing sound animals to infected ones at fairs, or other cattle shows; and by exposing them to infected cars and stables. There are other ways in which now and then it is possible that an animal may become infected but the means of dissemination mentioned in this paragraph are those to be guarded against in formulating efficient methods of control.

V. A. MOORE, Chairman.
E. C. SCHROEDER.
M. P. RAVENEL.

Report of Committee on Disposition of Tuberculous Animals.

Your committeee on the Disposition of Tuberculous Animals begs to submit the following report:

In the work of control and eradication of tuberculosis in animals it is first of all of the utmost importance to establish the presence of the disease in all the affected cattle, since only by such a procedure will it be possible to guard the healthy and newly born animals from infection.

Fortunately we are in a position to determine with considerable certainty the vast majority of occult cases of tuberculosis in cattle, even the incipient cases, with the aid of tuberculin, and the clinical cases by physical examination. This alone constitutes a great advantage in the work of suppression of the disease. The tuberculin test should therefore be considered as a very important step in the eradication of tuberculosis. As a matter of fact all the recognized authorities on the subject are agreed on this point. Once the tuberculous animals are recognized consideration must be given to the most suitable and economical way of eradicating the disease from the herd. This naturally brings up the question of the disposition of the tuberculous animals, and in adopting any particular method one should be guided by the extent of the infection in the herd, the quality of the affected animals, the sanitary condition of the premises, and last but not least, the owner's intelligence and knowledge of the subject. The latter information is necessary to determine if reliance can be placed on the owner to carry out minutely all the details which are essential in executing any particular method of eradication that may be decided upon. The owner's co-operation in this work is without doubt a very essential feature of this great task. For this reason a campaign of education of the farmers and stock raisers relative to the control of tuberculosis in which all the advantages of the eradication of tuberculosis must be impressed on them, would greatly facilitate this important campaign. It is a well known fact that any voluntary method of suppression by the herd owners themselves would bring about better and quicker results than when compulsory measures are enforced upon them by legislative enactments. Nevertheless the time has arrived when a campaign looking towards the control of this disease should be entered upon by the general government as well as the state and province. This campaign must reach in the first place all the clinical pulmonary forms of tuberculosis; then tuberculosis of the udder, intestines and uterus.

Having removed these exceedingly dangerous cases the balance of the tuberculous herd may be treated by the Bang system, which consists of the establishment of two herds of cattle, one containing the animals which react to tuberculin, and the other those that prove to be healthy. Each class of cattle is kept entirely separate from the other, in different stables when possible, and under the care of separate attendants, using separate utensils. The calves born of the diseased cows are removed from their mothers at birth and placed in the stable with the healthy animals where they are reared upon the milk of healthy cows or upon other milk which has been properly pasteurized. In this way the healthy portion of the herd constantly increases while the diseased animals are disposed of as rapidly as may be deemed necessary until finally all of them are gone and the remaining herd is composed entirely of healthy cattle. The tuberculin test is applied to the healthy herd at regular intervals, annually or semi-annually, in order to detect any cases of latent tuberculosis or recent infection which may appear.

A modification of the Bang system is Ostertag's method of suppressing tuberculosis. This system demands only a clinical examination of the original herd with the elimination of all open cases of tuberculosis. The calves from the remaining cows are immediately removed and brought up on pasteurized milk in the same manner as in the Bang system and a new herd is thus established from the young stock. Healthy nurse cows could be used for these calves instead of feeding them on pasteurized milk. The tuberculin test is applied to this new herd at stated intervals in order that any cases of tuberculosis which may develop therein may be discovered promptly. Neither of these systems, however, has met with much favor in this country as it required a considerable length of time and care to create a herd free from tuberculosis by either of them. Nevertheless the inauguration of Bang's or Ostertag's method in herds of valuable animals whether they be dairy or beef breeds is unquestionably of an economic value and in such cases either of these systems should be encouraged. On the other hand, in ordinary beef or dairy herds the practice of Bang's or Ostertag's method in this country has not met with much encouragement, owing to the extraordinary supervision, time and labor as well as the loss of market milk from the reacting cows which it involves.

In such herds the best ultimate results have thus far been obtained by the obligatory disposal of all the clinically affected cows and giving the dairyman the alternative either to pasteurize the milk from the remainder of his herd, or to be forced to refrain from selling the raw milk from the infected herd at all. In case he adopts the former method the herd composed of diseased and healthy cattle should be placed in quarantine under the supervision of sanitary authorities, and no sales should be permitted from the herd except for immediate slaughter. The alternative method will compel him to dispose of his tuberculous animals in the case he refuses to pasteurize the milk. The suppression of tuberculosis could be greatly facilitated and the co-operation of many of the herd owners could be gained by a provision by which a certain percentage of indemnity could at least for a term of years be paid for the condemned animals. The scale for such an indemnity should be arranged in accordance with the final disposition of the carcass under competent inspection.

Another method of eradication should receive serious consideration as being of value in some localities. This is known as the Manchester system which is either the Ostertag or Bang system applied to localized areas or even individual farms, from which centers the work progresses to surrounding or neighboring districts and farms. Inasmuch as the animals affected with clinical tuberculosis are the greatest source of danger in the dissemination of the disease, compulsory reporting of such cases should be inaugurated by the state, as is now done in many places in the control of human tuberculosis. Mandatory reporting of these cases and their prompt slaughter are very essential, as only by the elimination of these exceptionally dangerous cases can it be hoped to take up all the other details by which a successful control of bovine tuberculosis may be accomplished.

In conclusion your committee, having regard to the disposition of pure bred cattle, or valuable animals kept for either breeding or dairy purposes, would strongly recommend a system requiring the removal of all clinical tuberculous animals from the herd, the segregation of all calves from the remaining cows in order to establish a new, clean herd, the use of tuberculin tested nurse cows or pasteurized milk for these calves, and the periodic application of tuberculin to this newly established herd, as the only thoroughly reliable one.

Signed
W. C. EDWARDS, Chairman

How Can Alfalfa Growing Receive a Boost in the Maritime Provinces ?

Every one of our farmer friends are asked to make suggestions. We will give them widest publicity possible. C. W. McDougall, Dairy Superintendent for New Brunswick, has demonstrated to us that Alfalfa can be grown successfully in New Brunswick. Have any of our Nova Scotia or Prince Edward Island friends been able to produce it ? Is it worth trying to establish on our farms ? Can the provincial governments do anything to encourage its growth ? If so, what do you suggest ? Is there any information regarding it that THE MARITIME FARMER can publish ? Can we be of any assistance, if so how ? A few suggestions for you to answer are asked with the hope that you will act at once. We want to hear from every farmer in Canada. You are at liberty to take up any phase of the question that you see fit and are not confined to the questions we have asked. Address communications to

THE MARITIME FARMER,

Sussex, N. B.

Clearing New Land.

The right way to clear land is to take the brush out by the roots that are one inch to three inches through and pile them on the smaller brush. Let them stand a week if the weather is fine and burn them nights after the sun sets. Then there is no danger of doing any damage and everything will burn up. This is my way of clearing land and I have followed it for the last 16 years and never had any complaint.—George H. Pearson.

For reddened skin bathe the face with milk of roses, procurable at the chemist's or plain milk, and shade it as much as possible from the sun.

Some housekeepers use a paint brush for dusting the crevices and corners in their furniture; but a firm, sharp-pointed brush made for the purpose can now be had.

EDUCATIONAL VALUE OF AGRICULTURAL FAIRS.

The agricultural fair from its earliest inception was based upon the principal of comparison and the exhibition of the best. This incentive to a friendly rivalship in contest has been the stimulating influence which has given the agricultural fair its educational bearings and which has placed a premium upon excellence in quality as a just recognition of merit. The ambition of man to excel in ownership and production is only exceeded by his ambition to acquire knowledge.

The agricultural fair and exposition is the setting forth of things acquired, the presentation of principles in animal and plant breeding, growth and development involving improvement. The fair is the great demonstration station where the experimenters, experts in the various lines of agricultural and industrial enterprise, congregate annually to report their achievements and measure by comparison for the degree of merit to which each is entitled. The fair is the prompter, the promoter, in fact, that sows the seed of contest in the mind of man, that creates ambition within the ambitious to become aggressive rivals in production of the very best that the skill and ingenuity of intelligent man can cause to be brought forth as a breeder, grower or manufacturer.

The agricultural fair is becoming more and more a community necessity. The improved methods of farming that are now taught, studied and practiced makes each farmer, to some degree at least, an experimenter and scientific investigator in crop-growing. This class of farmers are interested in what their neighbors are doing, how they are doing it, and in their results. Here develops the necessity and demand for the county fair and introduces the backing for its successful operation. This spirit of scientific farm operation does not stop here; it is of the expansive sort; it eventually reaches out until it knows no bounds; it is not circumscribed by township or county boundaries. The more progressive farmers soon become of state notoriety in their work and production and demand stronger competition than the county fair affords, thus the state fair becomes a necessity from this feature of exhibition standpoint.

The agricultural fair stands for thrift, industry, enterprise, all that means advancement, progress and the building up of the commercial and manufacturing interests of the country or community in which it is located. The agricultural fair might be said to represent the outgrowth of intelligence and agricultural progress that this particular community has attained. The agricultural fair, to be true to its name and purpose, should be an educational exhibition in all its departments and features. The tendency now throughout all agricultural communities is toward education ; not exactly education in the knowledge of books, but in a knowledge of things in the operation of methods and their results.

Man's admiration for the best, for those things which reach the highest degree of perfection, is only the natural outgrowth of intelligence and the acquiring of skill in the particular branch or industry involved. The agricultural fair should be so planned and so directed in all its exhibition features as to present the instructive and educational aspect of the display to the eye of the public. The trained exhibitor will always present most prominently the suggestive features of his display in order to enlist the attention of the visitor, the sightseer, the inquirer for information. The agricultural fair in all its departments should be suggestive of the possibilities of the highest degree of excellence to be attained in the particular branch or line of product displayed. The agricultural fair built upon the principles outlined and conscientiously guarded in every feature and form of exhibit and concession, that nothing is admitted to the fair grounds or remains on exhibition or in operation under its sanction that is not meritorious as a clear and creditable amusement or entertainment feature, cannot but merit and receive the commendation and approval of intelligent people.

The educational demands of the country are increasing. In every department of industry or business there is improvement introduced that is the result of educational effort. This is made quite pronounced at the fair, where the best of everything is congregated, where the principle of exhibition is based upon the best in quality. While inferiority used in comparison with the best may serve an educational purpose in the demonstration of quality by observation and comparison, there is no direct benefit in the creation of inferiority, whether in animal or vegetable life. The educational influence that the fair is exerting upon the mind of the public is a strong factor in support of this principle of training. The fair is increasing in popularity among the people because of the advantages it is capable of offering in the higher ideals of excellence in every form of production and manufacture.

In order to obtain the greatest educational advantage from the agricultural fair it is necessary that every feature of exhibition, amusement and entertainment introduced upon the fair grounds be of an educational tendency, of character and influence capable of appealing to the finer sensibilities of its patrons. Each department on the fair grounds should become educational within itself by being under the supervision of a skilled and trained instructor in the special work or industry in charge, thus offering visitors the advantage of capable and qualified persons to answer intelligently any and all questions pertaining to the work or industry. This is the foundation principle upon which the educational fair is built.

BOVINE TUBERCULOSIS.

Owing to the great economic and sanitary significance of animal tuberculosis to the live stock industry of America, and the many and varied factors which must of necessity be accounted with in formulating successful measures for its eradication, the American Veterinary Medical Association, at its meeting in Chicago in September 1909, appointed the International Commission on the Control of Bovine Tuberculosis. The commission was instructed to study the problem of tuberculosis among cattle and to report at the next meeting of the Association upon reasonable and economically practicable methods or systems to be recommended to both officials and live stock owners for eradicating this great scourage of domesticated animals.

It is recognized that tuberculosis is widely prevalent among cattle and other animals and that the frequency with which this great evil occurs is increasing rather than declining. As tuberculosis is one of the strictly preventable infections, there is good ground for the belief that through the formulation and enforcement of proper regulations the disease may eventually be entirely surpassed.

Much valuable information in regard to the suppression of Bovine Tuberculosis may be found in the reports of the various committees appointed by the above mentioned commission which may be found on other pages of this issue.

A CASE FOR PUBLICITY.

The recent annual Convention of the Maritime Board of Trade had under consideration the possibility of attracting population and capital to the east coast provinces. The Maritime Provinces are a day or two nearer the old world markets than is most of the rest of Canada. Their soil and other natural resources are for the most part of high order, and yet population, industry and trade are by no means making the progress to be expected. The Convention tried to find the cause and confessed that the coast provinces "had scarcely lifted a hand" to change this condition. Britain has the capital and the overflow population and it is incumbent on the Maritime Provinces, besides soliciting the aid of the Dominion Government, to carry on an active propaganda of their own. The eastern provinces have unquestionably been conservative, but they will serve their own interests if they now follow up the suggestion of the Board of Trade. They might well study the promotion methods used by some of the western sections of the country, and in these or similar ways bring themselves properly to the attention of capitalists and homeseekers in the old world. Publicity as regards the splendid advantages of Eastern Canada is what the Maritime Provinces primarily need.

FIX UP THE SCHOOL HOUSE.

Give the school house a coat of paint, then repair the fence, and above all plant trees, flowers and shrubs, arrange the trees and shrubs along the outside edge and plant flowers around the school and along the fences and streets. Arrrnge them so as to give a view of the road that will call forth a gasp of admiration from passersby, have plots for the boys and girls to grow what they like in, and have the teacher explain things as they grow.

Now, parents, just think it over. Get together and talk it over, arrange to make your school grounds one of the brightest spots in the country. You will find your children have a love of schooling and will learn far more rapidly; it stands to reason. Plant corn in the cellar and you have a stunted growth, but plant it out in the sunlight and God's free air, and what do you get? why a plant full of vigor. It is the same with your children. Keep them in a dark, neglected school-room and they will take no interest in their work, but on the other hand give them a bright school-room and they rapidly develop into men and women full of energy.

WOMEN'S INSTITUTES.

On another page of this issue will be found an article re the organization of Women's Institutes in the Maritime Provinces. Our columns are open for discussion and we would like to hear what our lady readers have to say re this matter.

Women's institutes have done a lot of good in other countries. Why not have them organized in the Maritime Provinces.

Rye For Pasture.

The value of winter rye as a pasture is all too little known. If it were better known it would be grown for such use to a far greater extent than it is. None of the small cereals will compare with it in providing pasture. Its strong points as a pasture include the following. It may be sown at almost any season of the year; good pasture may be obtained fall and spring from the one sowing; a stand of grass may be obtained while it is being grazed, and it may usually be followed by another crop the same season.

If rye is to furnish good pasture in the autumn it must be sown early in the north, as early as August. It must then be grazed somewhat closely, for if allowed to grow too rank the head may form, which would destroy its power to grow in the spring. But a more important reason for grazing it closely is found in the tendency in the grazing to rust when it becomes of rank growth While the weather is still warm cropping is down prevents it from rusting. It may thus be made to produce a large amount of grazing in the autumn, but when it does the grazing furnished in the spring is less than that obtained from rye under similar conditions of growth but sown later and not pastured. In the spring grazing is furnished earlier by rye than by any other plants used as pasture. The duration of the grazing depends somewhat upon the closeness of the cropping, but usually it does not continue good more than five or six weeks. By that time, however, other grazing is abundant, as a rule.

If rye is sown in the autumn and timothy or redtop, or both, are sown along with it, these plants will root in the autumn and will not only be ready to furnish grazing along with the rye in the spring, but they will continue to grow and furnish grazing indefinitely.

Another way is to defer sowing the seeds to the early spring, and then to sow such clovers and grasses as flourish in the locality and cover them with the harrow. Under proper conditions this harrowing will help the rye. There may be soils on which the early grazing of the rye would injure the growth of the grasses. On other soils, however, such grazing will be helpful to them, rather than harmful. Where this method succeeds it enables the farmer to get pasture quickly when this may be necessary.

When rye is sown in the autumn for pasture, it is usually sown after some other crop has been grown for the season on the same land. Thus, it may come after any of the other cereals. When grazed down in the spring there is still time to follow it with other crops. These include field roots, rape, millet and cowpeas. Excellent crops of these are frequently grown after rye pasture.

All kinds of quadrupeds kept on the farm may be grazed on rye. Its highest use probably is found in grazing ewes in the early spring that are nursing their lambs, or in grazing weaned lambs in the autumn in the absence of better grazing. Under some conditions it is a great aid in furnishing pasture to swine. However, it must be pastured with caution by dairy cows, or an unpleasant odor may be given to the milk. Early succulent rye is excellent for the production of milk. Such grazing is not much used in growing beef, as it is usually too limited in supply for such a use.

Rye has not proved a first-class soiling crop, chiefly for the reason that it gets woody so quickly that it is not much relished by live stock. This does not mean however, that it should not be used as soiling food. It is first ready in the spring and for a short period it may be made to furnish more or less of the green foodnecessary until it can be obtained from other sources.—Prof. Thos. Shaw.

Drying Potatoes.

Bearing ever in mind the great quantity of potatoes that were worthless or practically so, last year, owing to the lack of demand, we submit this bit of information from an exchange.

"A German company has undertaken to save the odd 5,000,000 tons of potatoes lost annually in that country through lack af immediate market by desiccating, or drying the vegetable, so as to preserve it in usable form. Pressure, combined with vacuum, is used to withdraw the bulk of the water from the potato, and artificial heat dries the resulting "meal." This meal has one-quarter of the original weight and occupies one-eighth the space. It tastes and smells somewhat like newly made bread. It may be used or kept in this condition for considerable periods. Pressed into cake it is used for animal feed. In practice, three and eight-tenths tons of potatoes yields one ton of potato meal, at a cost of about 56 cents a ton. Twelve cents a ton added for pressing makes the cost of the cake 68 cents, which is not high for fodder of such quality. Chemical analysis shows the following percentages of food value: Water, 11.50; fat, 0.31; protein, 3.73; ash. 2.06; fiber, 1.71: carbohydrates, 80.69. The residual liquor, after pressing, is about 80 per cent. pure albumen, which has a ready market.

What has become of the potato flour industry? A few years ago this product was hailed as a revolutionizer of cake making, but during the past year or two we have heard nothing about it. Why could not "cheap" healthy potatoes be made to bring in the dollars this way? We still must eat.

Preserving Manure out of Doors.

We believe that the very best way of handling farmyard manure is to draw it out and spread in the fields each day as it is made. Under our conditions, however, such a practice is impossible. As all the upland portion of our farm is very hilly, manure so applied would largely be washed away. It is therefore necessary that we keep the manure in the barnyard or in large piles in the field during the winter. We have not a manure shed and as we are very careful in piling our manure, we do not lose much fertility through having it exposed.

The method which we follow in preserving manure out of doors is as follows: A level piece of ground is selected near the barn and several loads of muck are hauled and spread on this to hold any liquid that would otherwise leach away in our light soil. Starting at one end of this piece of ground, the pile is built about four feet thick. The sides are kept as straight as possible thus giving the rain very little chance to wash out fertility.

The top of the pile is left slightly concave to absorb the rain. The manure from the cow and horse stables is mixed and tramped down hard each day. We always take care to see that the rain water from the roofs of the barn does not flow near this pile. If it did, as is the case on some farms where the manure is merely thrown out of windows, under the eaves, much of the fertility would be lost. Where only the natural rainfall reaches the manure practically no damage is done. Of course when manure is kept out of doors in this way, it is necessary to use quite a large amount of absorbents in the stables.

Occasionally when the weather is favorable and a large amount of manure has accumulated in the yard, it is hauled out to the field where it is to be used the next spring and piled in exactly the same way. It is then handy work.—E. F. Eaton, Colchester Co., N. S., in Farm and Dairy.

The Purpose of Fall Plowing.

The regular fall plowing is followed in order to accomplish two purposes: 1st.—To expose the earth to the action of the frost. 22.—To increase the water holding capacity of the soil. This latter is a result of the first. The frost acting on the very fine particles of clay or colloids as they sometimes are called, gathers them in to compound particles. This creates ideal conditions for the retention of a large quantity of water in the soil for the use of plants.

The main object to be sought for in fall cultivation, is to leave the ground open and rough in order to allow the frost to do its work properly. For this reason the cultivator, harrow or roller should not be used on land plowed after fall wheat seeding and left for winter.

Where it is necessary to cultivate in order to destroy weeds it is a good plan to rib the land with a double mouldboard plow, the last thing in the fall. This puts the sail in excellent condition and facilates drying in the spring, thus allowing af very early seeding. Where a big seeding is to be done in the spring of the year or where the land is inclined to be a little wet, ribbing late in the fall will often give a start of several days in the spring.—S. E. Todd, in Farm and Dairy.

The Farm Bulletin Board.

There is not much of the year but that a farmer can have something to sell. Often it is not enough to warrant a trip to town, perhaps nothing more than an extra pig or a few dozen cabbage plants. If he had a customer at his door he could dispose of even this small surplus at a profit. But he thinks it is "not enough to bother with," and so the extra quarter or dollar is lost.

The bulletin board offers the easiest solution of the problem. A plain board, painted black and nailed to a fence post will do, but a pair of ground, round posts 6 or 8 feet high, setin the ground near the front driveway may have an arched top and be quite ornamental.

The name of the farm, and of the proprietor, should be painted at the top in medium-sized white letters, also the words "For Sale" in the middle of the board. If liked, another division towards the bottom may be headed "Wanted." It is a good way to get many things brought to you without the trouble of running all over the country—seed oats for instance, or a new milch cow.

In the "For Sale" section should be written in whatever is to be disposed of, no matter how little. It is surprising how many things can be turned into a dollar that would otherwise be wasted.

The name of the farm, too, helps to give the impression that the owner takes a pardonable pride in his surroundings, and to individualize both farm and farmer in the minds of the passers-by. If advertising pays the merchant, why not the farmer. Try it.—K. A. Grimes.

Maritime Winter Fair.

The Tenth Annual Maritime Winter Fair opens at Amherst on Monday, December 5th, running to Thursday, the 8th,

Special attention has been given to the prize list, adding wherever it has been found necessary to do so.

The number of Specials in money prizes, cups and goods, is greater than in any previous year.

From the number of inquiries for prize lists, it is fair to anticipate a bigger and greater fair than any of the previous ones.

Low transportation rates have been secured on all lines and those who are interested in agriculture should not miss the opportunity of attending.

Superiority of Dry-Picked Poultry.

Canadian exporters of poultry should be interested in a recent series of experiments in connection with the cold storage of poultry which have shown that the method of scalding chickens by plunging them in water just below boiling point to facilitate the removal of the feathers affects the keeping quality of the prepared birds. This method in the past has been very commonly practised by exporters of poultry in the United States and other countries. The experiments under review revealed the fact that deterioration is greater in the case of scalded fowls than in those that were dry picked, and the bacteriological examination proved that the number of bacteria was increased when the birds were drawn before being placed in cold store. Dry-picked birds in good condition, promptly stored and kept for three and six months, are stated to have been hardly distingishable from freshly killed fowls.

Best time to Spread Manure.

On the majority of soils it is safe to spread manure in the fall, either for fall or spring plowing. If manure has been accumulating around the barnyard or in the manure shed it is a good time now to draw it out and spread it upon the land. In no way does manure give as large returns as when spread on grass land, and there is no better time than fall. The fall rains and winter snows will soak it well into the soil where it will be available for the grass roots when they start in the spring.—D. S. Bacon.

The Apple Cellar.

An apple cellar should be the tidiest and sweetest corner of the house. Nothing else should ever be stored in it. Its walls should be at least twenty inches thick, and it should have abundant light. All summer it should be open to drafts of air and kept free of any decay.

There should be no mouldy boards or any smell of mildew. In other words, the air should be fit to breathe. When the apples are stored the drafts should be stopped, and when steady cold sets in you should shut the cellar tight and let it stay closed until May.

You can place such a cellar as this conveniently under part of your barn or under your carriage house, only there should be no stable adjacent. The floor overhead should be covered with autumn leaves, spread thickly to prevent any change of atmosphere below. The thermometer all winter should stand at about 33 just above freezing. Put your apples in shallow bins, cement the floor to keep out rats, and if barrels are used set them up somewhat from the floor.—Outing Magazine.

When a cold becomes settled in the system, it will take several days' treatment to cure it, and the best remedy to use is Chamberlain's Cough Remedy. It will cure quicker than any other, and also leaves the system in a natural and healthy condition. Sold by all dealers.

HORTICULTURE

President Vroom's Address at the N. B. Fruit Growers' Annual Convention.

Members of the New Brunswick Fruit Growers' Association.

Gentlemen,—It is with great pleasure that I meet with you again in the annual convention of the Association. While it is our sixth annual convention, I think it might be called the first of a new series, as it is the first time that the province has been at all generally represented either in membership or exhibit. All honor to the pioneers who five years ago sought by this organization to bring fruit growers together for their mutual advantage. None will rejoice today more than they at the forward movement which is evidenced by the splendid exhibit of fruit in the rink and by the rich program which is laid before us. To the energy and skill of our efficient secretary, Mr. Turney, we are indebted for the advanced position of our association and it certainly looks like the opening of a new era in the fruit growing business in New Brunswick.

The season just closed has not been a very prosperous one for the fruit industry in this Province. Small fruits indeed, yielded good returns, but they are grown to a limited extent, the acreage given to their culture not being so large in the increasing demand would justify.

When we speak of our fruit industry, however, we refer more especially to the apple, the king of fruits, and the fruit in which New Brunswick is and must always remain principally interested.

With exception of a few varieties the crop of this fruit with us has been exceedingly light, although trees blossomed well in the spring. This was perhaps due to a combination of wet cold weather and frost while the trees were in bloom. The weather conditions during the early growing season also were such that what fruit we have is rather inferior in size and quality. An occasional partial failure of this kind will of course be no discouragement to one who is in earnest in raising fruit. We must meet with adverse winds on whatever sea we sail, and the man who is not prepared to meet some set backs and obstacles in his career had better consider seriously if he would not do well to engage in some other line of labor and leave the growing of fruit to others. It would seem sometimes that all the forces of nature, animate and inanimate, were arrayed against us. The frost and the sun combine to take the life from the feeding roots of the tree, to strip the bark from the trunk, or to trim back unmercifully the season's growth of wood; the cruel wind takes off the branches, destroys the blossoms or denude the trees of fruit. The fungi attacks both trees and fruit, the ground mouse girdles, the rabbit cuts, while legions of insects seem to prefer the apple to any other tree that grows. The borer starts at the ground and riddles the life out of the tree. The bark louse sucks it out higher up. The tent caterpillar, the red hump, the fall web worm, the leaf roller, the green aphis, the blister mite and the brown tail, show their good taste by exhibiting a decided preference for the apple. The coddling moth and the maggot are after the fruit and if they leave any, junior humanity steps in to fill its pockets and is often supplemented by senior humanity which fills meal bags. The fruit grower of today must have pluck, perseverance and determination in an eminent degree. When the enemy marshals its forces he must be prepared to meet them, equipped with cultivator, pruning knife and sprayer.

It is no easy task to raise fruit in the face of the difficulties suggested and many others, but it makes a man out of him who is prepared to overcome them all and win. It calls for a knowledge of the soil, its make-up and requirements; a knowledge of plant life and the necessary conditions for its fullest development, a knowledge of insect life, and incidentally af insect death; a line of reading which covers the latest discoveries and developments of science bearing on this work and withal a good business head. Point out to me a successful horticulturist and I will show you a man of marked ability, capable of making his way in any walk of life. You will find him an all round man with a knowledge and a grasp of detail such as is required in few other lines of business. Yes, I magnify the calling of the fruit grower. There is no better under the sun, and it is not all dreary fighting either. Can there be anything more interesting and fascinating than work among growing trees and plants? Give me the life that is close to nature and to nature's God. As I once heard Prof. Robertson put it "we work in partenership with the Almighty." The orchardist sets his scions, God sends the life blood of the trees coursing through the new wood, and we behold a miracle of transformation. Instead of the inferior fruit which the tree once bore, we now have the fruits of our choice. And what fruit grower who loves his work is not an experimenter? He plants his seed and waits patiently the fruiting of a new variety. What joy there is to him in a new strawberry or a new apple of merit! A few days ago a friend gave me a plum, one of three borne as the first crop of a seedling tree, and I shared with him the joy of a new and promising creation of nature. The man who gives to the world a fruit of improved variety is a public benefactor and is deserving of more recognition that he usually gets. I believe it would be advisable for our governments to offer a substantial bonus for any new fruit that is a distinct improvement on anything that we now have.

Not only is there pleasure in fruit growing, but mankind is constantly bettered by the production of fruit. It has a refining influence on those who raise it, those who behold it, and more especially on those who use it. There is no article of food in the world so health giving as raw ripe fruit. The man who uses this food plentifully and regularly in the place of a heavier diet, cleanses the system from disease, loses unnatural cravings for stimulants and is of a sounder body and therefor of a sounder mind. The consciousness of all the good and pleasant features of the fruit business is a reward to the grower, but I believe it to be a fact also that there is no more profitable line of business in New Brunswick today than orcharding with up-to-date methods. The display of fruit in St. Andrews Rink, today, the more remarkable under the conditions of this season, shows that we can raise good fruit. In some varieties we can beat our friends of the neighboring Province, and perhaps the world; and I venture to say that this show is nothing to what it will be next year with a better fruit crop and better preparations on the part of our present members and those who are coming. I might also say with better fruit, for this convention will not have accomplished its purpose, unless it has inspired us with higher aims and taught us better methods. The West cannot raise better fruit than we can raise, but it does raise better fruit in some respects than we do raise, and it puts on the market in better shape. The time will soon come with us when fancy fruit must be packed in boxes and barrels be reserved for the lower grades. Leading up to this I think our Association should take some steps for teaching box packing to our orchardists.

Bulletin No. 19 issued by the Dept. of Agriculture, Ottawa, contains valuable instructions on this subject and any one who have not seen it should obtain a copy. I believe also that the market is ready for fancy apples put up in small baskets that a man may buy and carry home with him as he does a basket of grapes.

Let us popularize our fruit, both in itself and in its package and we will at the same time make it more profitable to ourselves. Eat fruit, show fruit, talk fruit, sell fruit, give away fruit, but first of all raise fruit and raise better fruit and more of it.

The Action of Lime-Sulphur on Spray Pumps.

Editor Maritime Farmer:—

Some six or eight weeks ago, during a trip through the Annapolis Valley, I discovered that there was considerable uncertainty as to the action of Lime—Sulphur mixtures on spray pumps. It had been stated by some who were supposed to know that this mixture would quickly damage the brass parts of the pumps.

It is fairly well known that it has a corrosive action on copper.

Being a manufacturer of spray pumps and accessories, I was naturally much interested, and as I could find no certain information on the subject I saw no other way than to make up certain test mixtures and observe the results on various metals After a period of six weeks, the results are as follows:—

Copper—Corrosive action quite decided.

Steel, Iron, Brass—No corrosive action, though more or less blackened.

Tin, Solder—No corrosion; no blackening.

Leather—No hardening.

Rubber—No softening.

The above tests were made in mixtures as follows—

(1! One part lime-sulphur to ten parts water.

(2) One part lime-sulphur to one part water.

(3) Pure lime-sulphur, which was tested at 34 degrees Bame.

The results in all cases being practically the same.

The conclusion to be drawn from the above is that pumps with iron air chambers, if used entirely in lime-sulphur mixtures, will be quite satisfactory; or if the Bordeaux mixture is to be used occasionally, the all brass pumps will resist the corrosion of either perfectly. No hesitation need be felt in allowing the pump to stand for any length of time in either mixture.

Thanking you sir, for this opportunity of laying this important consideration before the fruit growers of the Maritime Provinces through the columns of your paper, I am,

Yours very truly,
R. B. WESTHAVER,
Mahone Bay, N. S.

The Possibilities of the over Production of Apples.

Having been called upon to address this, the Sixth Annual Convention of the New Brunswick Fruit Growers' Association, on a subject which has occupied the minds of fruit growers for the last half century, namely:— "The Possibilities of the Over Production of Apples", I am free to confess that the question is an important one.

Perhaps it would be safe to make the statement that a large majority

It Is Miserable To Be Dyspeptic.

Dyspepsia is one of the most prevalent troubles of civilized life, and thousands suffer untold agony after every meal.

Nearly everything that enters a weak dyspeptic stomach, acts as an irritant; hence the great difficulty of effecting a cure.

The long train of distressing symptoms, which render life a burden to the victim of dyspepsia, may be promptly relieved by the use of Burdock Blood Bitters.

Mrs. John Sherrett, Fortier, Man., writes:—"I was troubled with dyspepsia for years. A friend of mine told me about Burdock Blood Bitters, so I got a bottle to try, and before I was half finished I could eat anything without suffering, and when I had used two bottles I was sound and well. Now I feel just fine; indeed I can't say too much in favor of your medicine."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

"HIRAM"

Raspberry Plants for Fall Setting.

The "Hiram" is a strong grower, hardy and very productive. Fruit deer red, extra large and very good quality. Unexcelled for home use or nearby markets. Plants by mail, post paid 50c per doz.

ORCHARD HILL FARM,
Brown's Flats, N. B.

FOR SALE.

100,000 Apple trees, 75,000 Pears, Plum, Cherries. Complete assortment of other stock. Guaranteed first grade and TRUE TO NAME. Agente wanted on vacant territory, selling for fall and spring 1911 delivery.

THOS. W. BOWMAN & SON CO., LTD.
Ridgeville, Ont.

of those within sound of my voice, at the present moment, have heard the statement made, and no doubt some of you have made it yourselves "that the time was never at hand when there would be so many apples grown that no market for them could be found and the orchards which cost large sums of money and much time and hard labor to raise up to a bearing age would be hewn down and cast into the fire."

If this doctrine of over production has not reached New Brunswick, you are certainly fortunate.

It would, no doubt, be possible to produce more apples than could be profitably marketed but is it very likely to so transpire judging from the history of apple production and consumption in the past. I think not.

Permit me for a moment or two to look back over the past thirty years and see what has actually taken place. In the year 1880-1 the United States exported apples as follows:—

From New York 600,000 barrels.
From Boston 510,000 barrels.
From Portland 40,000 barrels.
From Philadelphia 10,000 barrels.
Total from American ports 1,160,000 barrels.

In 1908-9 the figures are as follows:
From New York 363,000 barrels.
From Boston 189,000 barrels.
From Portland 89,000 barrels.
Total 641,000 barrels.

By these figures we find that the export of apples from the United States has decreased over 500,000 barrels, going over a period of thirty years. Yet all this is no evidence that our neighbors across the border are less active or producing less apples than they did in the year 1880. Just the opposite is the case. More and better apples are produced than formerly but the demand is far greater in their own country.

Perhaps it would not be an exaggerated statement to make if I should say that not more than ten per cent. of all the apples grown in the United states finds their way into any export market, and I think it would not be going too far afield to say that judging from the increase in the population for the last ten years that at the end of the next ten our neighbors will be importing apples to be consumed by their own people.

Now let us look at the condition of things in Canada.

In the year 1880-1 the number of barrels of apples exported from Montreal was 145,276. In the year 1903 the export had gone up to 732,000 barrels. But since 1903 it has dropped to 353,000 barrels. Is this because the fruit growers of the great provinces of Ontario and Quebec are giving less attention to the growing of apples, not by any means, more apples of higher quality are produced, but the demand is so steadily and rapidly increasing in Western Canada, where thousands up on thousands of settlers are taking up farms and when large towns and even cities are springing up almost in a day, that the time is not very far distant when the old provinces of Ontario and Quebec will be exporting few, if any apples at all.

Let us now look for a moment at the Maritime Provinces. In the year 1880-1 there was exported from St. John, N. B., and Halifax, N. S., combined, 24,250 barrels. In the year 1909-10 the export from these ports had grown to 670,000 barrels, an increase in thirty years of 645,750 barrels. This increase is due to the increase in the production without a corresponding increase in local consumption.

With the United States consuming the entire product of their own country, and the great North West requiring the crop from Ontario and Quebec, after their own local market have been supplied, and with the export to the old country from Australia and Tasmania coming in at a time when North America has no apples to ship during the months of April, May, June and July, it is not a very great stretch of imagination to believe that the Maritime Provinces of Canada must supply to a large extent the apples consumed in the large cities on the other side of the Atlantic.

To return to our own Canadian West, I would like to remind you of the fact that it is not so very long ago, less than ten years, when the Dominion Department of Agriculture sent an experimental car load of apples to Winnipeg, and sent a man all the way from St. Catherines, in Ontario to look after the car. It was considered a risky thing to do, to send a car of fruit all the way to the city of Winnipeg.

What is the condition of things there to-day. Why, one firm from had handled over one hundred cars of fruit from St. Catherines alone up to the 22nd day of October, and up to that date nearly three hundred cars of fruit have been sold by auction in that city, and this does not include fruit sent in from the American side of the line. And in the face of all this, Ontario Spys are selling today, in the city of Winnipeg, for from $5.50 to $6.00 per barrel.

The Winnipeg Fruit Auction Company, which has only been in operation four months reported through their manager, Mr. Sinclair, that they had handled sixty-five cars of fruit from Ontario and ten cars from British Columbia up to October 20th.

About six years ago a trial shipment of apples was made to South Africa from Nova Scotia and it was found that there was a market for a limited amount of apples at a good price. These shipments have increased until this season twenty-five car loads of Nova Scotia apples will find a market in South Africa and this trade is destined to increase more and more, and further permit me to remind you that all of our local markets are expanding and our population is increasing, consequently more apples are consumed by our own people.

At the risk of wearying you, I must mention the fact that less inferior fruit is being packed every year, and our people will eventually get educated up to the point where they will pack only the good apples in barrels for market and send the poor ones to the canning factory and the vinegar mill.

A great deal more might be said along this line but you will bear with me while I say that to my mind the apple industry of Canada is yet in its infancy and the outlook was never brighter than at the present and the up-to-date orchardist has no reason to worry about the over production of apples. —An address by Geo. H. Vroom, Dominion Fruit Inspector for Nova Scotia, before the New Brunswick Fruit Growers' Annual Convention.

Everybody Should Read About This Offer.

This is a sample of the wonderful values we offer in our fall catalogue. Read about it carefully. Order one—if you do not like it send it back at our expense and we will refund your money in full.

This is exceptional value. We know you will like it.

5761.

5761.—What is more attractive for general wear than a tailored SHIRT WAIST? The answer is "nothing could be." Undoubtedly this is true. No matter where you go you will always see and always admire the lady with a natty Shirt Waist. They look so fresh and so easy going that you cannot help but appreciate their appearance.

Having these facts in mind we decided to offer our friends an extra special in a Ladies' Tailored Waist. It is made from a fine quality linenette. Has the latest broken front, Pearl buttons and the new laundred collars and cuffs.

We know you will like this Waist and we want you to consider having one if you think well of the style. The risk is all ours and you know we would not select this as a special, unless we were certain of its reception. Sizes 32 to 44.

Price - - - $1.15, postpaid

We prepay everything right to your door.

Money always refunded if not satisfied.

Send for a copy of our big fall Catalogue. You will like it A true index to the very latest London, Paris and New York styles. It is free for the asking. Send in to-day. Do not order your suit or coat before seeing this wonderful style book.

DAIRYING.

C. W. McDougall, Dairy Inspector, staff Contributor.

Maintaining a Dairy Herd by Purchase.

At the recent annual meeting of the Pennsylvania Live Stock Breeders' Association held in Philadelphia, Robert D. Edkin, who has charge of the herd of cows at the Westtown Friends' Boarding School gave a talk on the subject heading this article and in the talk gave a severe jolt to some of his auditors by the character and significance of some of his figures. The herd averages 100 cows but as it is maintained by purchase there are usually some 110 on hand, the purchases being of backward springers and the surplus kept to supply any displacements that may occur. The herd is made up of one-fourth grade Holsteins, one-sixth grade Jerseys, the remainder being Shorthorn grades bought from dealers. About one-fourth of the cows are kept in the herd from two to four years. Those not retained this long are sold when their daily production of milk falls to about 13 or 15 pounds. The cows are fed heavily receiving an average of 12 pounds of grain the year round. The summer feed of grain in addition to pasture is a mixture of two parts cottonseed meal, three parts hominy and one per cent salt. The winter ration is an average of 33 1-3 pounds silage, five pounds corn stover or cheap hay and 12 pounds of grain composed of seven parts cottonseed meal, three parts linseed oil meal and nine parts hominy with one per cent salt. The grain for the herd runs from 6 to 18 pounds per day depending upon the condition and production of the cows.

The average purchase price of the cows has been $40.70 per head. The average selling price for cows rejected or discarded was found to be $32.52 showing an approximate loss on the average exchange of $8. The complete figures given by Mr. Edkin will be found of more than passing interest to the progressive dairyman and I append them: Rent of barn per cow, $2.50; interest, $5.28; tax, 25c; depreciation, $8; maintenance of equipment, etc., $5.26; stover at $5 per ton, $3.20; hay at $12 per ton, $5.16; silage at $3 per ton, $12; pasture, $5.33; grain, $69.39; labor and management, $35.65; total, $152.02.

The average yearly production per cow was 9,500 pounds of milk, 4.2 per cent fat. This is equivalent to 4,370 quarts which cost 3.48 cents per quart or $1.60 per 100 pounds. There are several striking features about the work of this herd. The method of maintenance is not unusual in many large commercial herds but my observation has been that it is not an advisable plan for the average dairyman. The feeding of this herd is very heavy and it seems to me quite beyond the safety line for the dairyman at large if he wants to keep on the side of his usual modest profit. The yield of milk per cow in such a large cosmopolitan herd is both unusual and remarkable. It teaches us the lesson, however, that many dairymen need to learn the relation between heavy feeding and heavy production. In this connection there must be the element of possibility that the expense of feeding is higher than even this phenomenal production justifies. When cows are fed as individuals there is certainly a line in production in relation to feed that it is not financially profitable to pass beyond. This line is drawn not by the herd but by the individual members of it and is no doubt recognized by Mr. Edkin.

Now, the financial equation of this operation has its determination in the selling price of the milk. If the milk is sold at an average yearly priceof $1.75 per 100 pounds—which is quite above the amount received by dairymen remote from favored markets—the profit per cow would be too small to be counted as a good business margin. If sold at three and one-half cents per quart, which just at this time some of our friends in New Jersey are protesting they must take for their milk, the loss is of most uncomfortable proportions. If the milk is sold at a net price of four cents per quart, the profit is on the side of prosperity; at five cents per quart the profits are golden, while at a possible eight cents we have suggestions of diamonds, automobiles and coupons.

The integrity of Mr. Edkin and of his figures cannot be questioned. However much one might be inclined to criticise some of his feeding and his maintenance methods this one lesson stands out in his work; he has system and great care of detail. The feeds he buys in such quantities are sailing under their own colors; they are straight oil meals and hominy and are not of the various mixtures and combinations for which many feeders are with questionable wisdom spending so much good money.

A Dairy Conversation.

"Hello, Mrs. Jersey, where do you come from?" "Me, why I came from a dairy section," replied Mrs. Jersey giving her head a gentle toss as with calm, lustrous eyes she surveyed the questioner, whose appearance gave some evidence of belonging to the noble family of Shorthorns.

"Well, you might as well go back there, you know you are not suitable to our conditions," suggested the Shorthorn eyeing the newcomer almost angrily.

"I can't see how that may be," replied Mrs. Jersey. ...

"Oh, you don't. Well, it is so just the same," and the Shorthorn, provoked by the confident bearing of the other, made a lunge with her horns. The Jersey just barely escaped.

Surprised and alarmed she retreated a few paces and resumed the conversation with another Shorthorn more peaceably inclined.

"I am sure I can't understand why I am suitable in one place and not in another," she insisted. "I think the corn and alfalfa here is as good if not better, than what I used to get I know that it tastes good to me. Last night I heard Mr. Ressmdssen saythat I gave over 50 lbs. of milk per day testing 5 per cent, or 2½ lbs. of butter-fat each day, and he thought I would do better next week. How much did you give?" ...

"I don't think it was as much as that," replied the other eyeing the Jersey with some degree of admiration because it was one of the boasts of her family that they were of the milking strain. "Only this morning I gave over a pail of milk. I do not know what size pail it was and for the test I am sure I don't know it either. I don't believe Mr. Jones knows himself though he does think I am a powerful big milker." Jersey seemed surprised to hear that as her mother and grandmother had an average yearly record of over 500 lbs. of butter-fat and she knew that Mr. Rassmussen would not sleep well if he did not know from day to day what his cows were doing. Her own record for the past year had been 12,422.4 lbs. of milk, testing 4.8 per cent. making a total of 596.2 lbs. of butter-fat in a year. "Well, I don't know," she added thoughtfully, "I am sure I cannot understand why I would not do here. Mr. Rassmussen only keeps twenty cows and last year he sold over $2000.00 worth of butter-fat and I am certain I never saw as many pigs go off the place as he hauled off last year. I heard him say just last month that he made a clear profit of $40.00 per head after charging us for the feed we ate. I think though he allowed that the skimmilk and the manure paid for the labor of caring for us."

"My Goodness," exclaimed the other, "you don't mean to tell me that he charged you with the feed you ate. Why, I don't believe Mr. Jones ever gives that a thought. He just feeds us, that is all out here they don't think of that. There may be a few that do but they are very scarce. I do know, however, that whenever a farmer goes into town and buys feed to feed his cows it is not long before he has cows that look like you. It may be that you can get along here all right."

If it is butter-fat that is to be produced I believe that I can produce it," emphatically declared the Jersey

With that the two cows parted to the field happy in having formed a new acquaintance.—John Bower.

Cheap Milk Production.

The first essential point to be considered in this important question is cleanliness. Keep the stables clean, disinfected and purified by whitewashing at least twice a year. Then ventilate, brighten and cheer by the free access of pure air and sunlight.

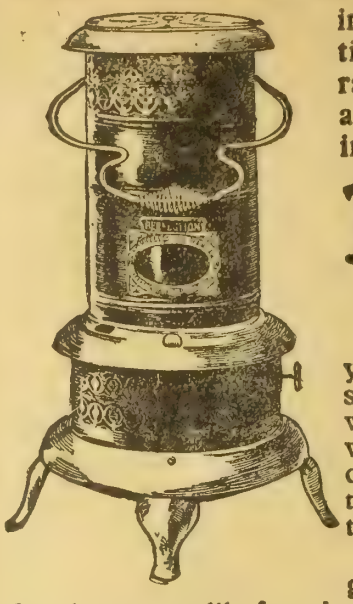
Get as much sunlight in the stables as possible. Scientists say that 10 minutes of sunlight will kill tuberculosis bacilli, and Dr. John Nichols, president of the Ohio Dairymen's Association, says sunlight and air will rid our herds of tuberculosis; medicine and slaughter never will. The dairyman who is unwilling to observe the ordinary rules of cleanliness is responsible for much of the arbitrary action of health boards.

The greatest difficulty which is at present most evident to the farmer is the high price of concentrated feeds. The only way to overcome this difficulty is to farm more, raise more grain, and cut down your big feed bill.

The method which is recommended to dairymen for producing cheaper feed is to keep your land in short rotation, not more than three or four years using corn, small grain, then grass. When land is such that short rotation is impracticable, precaution should be taken to top dress every year.

The growing of clover and protein crops, to save grain bills, is now the exception, not the rule, and until

You Can Work Near a Window



in winter when you have a Perfection Oil Heater. It is a portable radiator which can be moved to any part of a room, or to any room in a house. When you have a

PERFECTION SMOKELESS OIL HEATER

Absolutely smokeless and odorless

you do not have to work close to the stove, which is usually far from the window. You can work where you wish, and be warm. You can work dull winter days in the full light near the window, without being chilled to the bone.

The Perfection Oil Heater quickly gives heat, and with one filling of the font burns steadily for nine hours, without smoke or smell. An indicator always shows the amount of oil in the font. The filler-cap, put in like a cork in a bottle, is attached by a chain. This heater has a cool handle and a damper top.

The Perfection Oil Heater has an **automatic-locking flame spreader,** which prevents the wick from being turned high enough to smoke, and is easy to remove and drop back, so the wick can be quickly cleaned. The burner body or gallery cannot become wedged and can be unscrewed in an instant for rewicking. The Perfection Oil Heater is finished in japan or nickel, is strong, durable, well-made, built for service, and yet light and ornamental.

Cream Separator Buyers TAKE NOTICE

You know that the Babcock tester—used the world over for testing skimmed milk—contains neither disks nor other contraptions. Since the Babcock tester does not need inside contraptions, it is plain that a properly built cream separator does not need them.

Sharples Dairy Tubular Cream Separators

are the only separators free from disks and other contraptions. The only simple—the only properly built separators. The World's Best. Produce twice the skimming force of common separators and proved by the Babcock tester to skim twice as clean. The saving Tubulars thus make you is clear profit you cannot get any other way.

Tubulars are guaranteed forever.

Waste no time with common, complicated separators. You will want a Tubular until you have one—so why not get it in the first place. The manufacture of Tubulars is one of Canada's leading industries. We made the first separators manufactured on this continent and have been at the business thirty years. Write for illustrated catalog No. 194 telling all about Tubulars.

The Sharples 30 Yrs

THE SHARPLES SEPARATOR CO.,
TORONTO, ONT. WINNIPEG, MAN.

this condition can be reversed there will be no more prosperity among the farmers than at the present time.

Some farmers say it costs one cent a quart to produce milk, others say it costs two cents and still another one says it costs him three cents a quart to produce clean and wholesome milk.

The farmer that produces milk for one cent a quart is the man that raises, upon his own farm, all his protein and carbonaceous foods. The one who says it costs him two cents a quart is the one who raises just a little of it, and the one whose cost of production is three cents a quart is the one who says it is cheaper to buy feed than to raise it.

It is easy to grow the carbonaceous foods in the for of corn, but to grow the clover to feed with this to make a balanced ration and save the money we pay for protein in the form of bran, linseed and cottonseed meal seems to be the problem. If you are not growing clover in sufficient quantities, then rye, oats, and peas, corn-fodder, millet and green buckwheat can be used successfully in succession.

Prof. Haecker, of the Minnesota Experiment Station, is conducting a series of experiments to learn what may be accomplished in the work of improving the common dairy cow by proper feeding and care, and he finds that these cows are averaging 12 pounds more than they are throughout the state. He is positive that the difference in the yield is due simply to different methods in handling.

Better balanced rations, more regularity in feeding, would, in a single year, make good half the difference. Evidently the second difficulty is the need of practical knowledge of how and what to feed for milk production and what constitutes proper care and handling of herd.

If the 1,800,000 dairy cows in New York state could be made to increase their earnings of an average of $2 per year each, as those in Prof. Haecker's herd have done, the dairy farmer would be richer by $45,000,000 an average of more than $400 for each farmer.

According to the statistics of the New York State Experiment Station a cow should be given one-third as much feed as she gives milk. For instance, if she gives 60 pounds of milk give her 20 pounds of feed, or if she gives 90 pounds of milk give her 30 pounds of feed. Hence the only solution of this question of producing pure and wholesome milk at the least expense is to keep no more cows than your farm will produce sustenance for; pay more attention to the care and handling of your own dairy; and see to it that your dairy and stable at all times, are in a sanitary condition.

Good Cows and Poor.

The good cow is an investment. The amount we shall be able to make out of her depends upon how much feed and care and cow sense we put into her. She may be bred ever so well and be capable of doing a great and profitable work, but if her ways have fallen into the hands of an ignorant, stingy or careless man her birthright of royalty is reduced to scrub conditions. All this for the good cow.

The poor cow is a poor cow and that is all there is to it, and we need waste no saltpeter on her; but I believe in defense of her, she not being a free agent, that always somewhere in the early pedigree of the poor cow is written the stigma of a poor, scrub man. Many an intrinsically good cow is handicapped by such an owner who is limiting the scope of her possibilities. If it were possible for the cow for a short time to change places with the man and she run the dairy on lines of her ability and experience and weed out and feed up her former owner, what changes we would have in some dairy matters—what an uplift would come of the business! It is the man rather than the cows that marks the standard of the herd.

WINDSOR DAIRY SALT

The wise housewife knows the importance of always keeping a good supply of Windsor Dairy Salt on hand.

She knows that Windsor Salt makes the best butter—and she is not satisfied to make any other.

Windsor Dairy Salt is both a money-maker and a money-saver.

It makes money for farmers and dairymen because it makes butter that brings the best prices.

It saves money for them because, being absolutely pure, it requires less to properly salt the butter.

EUREKA
SANITARY CHURN

There's no comparison between the ordinary wooden churn and the "EUREKA". Barrel is stoneware—top is clear glass.
Besides being absolutely sanitary, the glass top enables you to see how the churning is coming along without opening the churn.
Also made with Aluminum top.
The "EUREKA" is the easiest churn on the market to operate. By tilting back the frame until the weight rests on the wheels, the churn can be quickly and easily moved—while the barrel remain upright.
If your dealer does not handle the "EUREKA," do not take a substitute but write us for catalogue.

LIVE STOCK.

Details of Winter Care.

Successful winter care of stock of any kind depends largely on scrupulous attention to details. This is especially true of sheep. While they are omniverous feeders, they refuse absolutely to eat anything that has in the least been defiled by themselves. Their feed troughs and racks should be kept perfectly clean.

We fasten the grain troughs to the tight board fence surrounding the yard at such a height that the sheep cannot get their feet in them, and of course, cannot jump over them. They are swept whenever there is the least suspicion of filth in them. The racks for hay and fodder are cleaned out every day. The refuse we throw over in an adjoining yard for colts. They clean it up so nothing is wasted.

We give salt twice a week, all they will clean up in a few minutes and water is kept constantly before them. It frequently happens that some of the flock need tagging in midwinter; this should receive immediate attentio. Ewe lambs often wet their long wool and need clipping. To do this properly it should be flared from the vent in such a shape that none of the voidings will be caught by the wool.

Frequent changes of feed will be found beneficial. We use hay, oat and wheat straw and cornstalks. Occasional runs on the fields on dry, pleasant days are enjoyed and afford exercise, if nothing more. This is especially good for breeding ewes.

The best flockmasters always have their sheep tame. They talk to them every time they go into the yards. One of them said to me: "I can't drive my sheep; they don't know how to be driven, but they'll follow me all over the farm."

I have succeeded in taming several flocks that were very wild by confining them to small yards, spending considerable time with them and never making any quick moves to start or excite them. They soon learn that they will not be harmed and will do far better than if they rush to the farthest corner of the yard and huddle up every time approached. Purebred flocks are usually tame because they are handled, petted and waited on till they have lost all fear of the owners. It is not at all uncommon for these shepherds to be able to catch any sheep wanted out in the field without yarding.

The successful shepherd is quick to see if any in the flock are ailing, and prompt to separate such from the flockand give extra care. Usually with me a sick sheep is a dead sheep. I never had much success doctoring them, but sometimes separation and change of feed will effect a change for the better.—E. P. Snyder.

Injury From Rusty Nails.

Rusty nails protruding through old scraps of boards lying about the barnyard or farm buildings do not often cause injury to the owner or caretaker himself, but stock, fighting running, or pushing around the yard, are liable to step on these nails and be injured. A purebred animal will die as quickly in this manner as a scrub, and the loss is many times greater. Where such unfortunate accidents occur, danger from infection can be prevented at home by almost anyone and the expense of a veterinary bill saved thereby.

As soon as an animal is discovered limping a thorough examination of the affected parts should be made. When it has been found that a nail or other foreign substance has been run into the foot or legs, it should be extracted at once and undiluted spirits of turpentine poured into the wound. This will kill the poison and remove the soreness from the wound, and in a short time it will heal. If the wound is a bad one it will require two or three applications; twice in one day ought to be sufficient in any case.

At first thought turpentine may seem too strong for such use; but if it were possible to compare the suffering an animal goes through that dies of blood poisoning with the little pain caused by the use of turpentine, no one would hesitate to use it.

But the best and surest, the least painful and the most profitable way for all concerned is to get up steam in your own boiler, and with a little lubricating oil for the spinal column, pick up all such scraps, remove the nails, and use the pieces for firewood.—F. W. Greene.

Winter Feeding.

The winter feedin go fsheep is a very important factor in the success of any sheep owner.

Already by this time the "bum" lambs and the toothless old ewes have been cut out and sold.

Roughly speaking from December fist to May first the farmer must fur nish daily feed to his sheep, for pasture or grazing is practically impossible during that time. Of course many act on the plan that any old thing any old way will do, but the man who succeeds best and secures the greatest profits from his flock is ever watchful for some new method for some improvement on the old way, either to secure greater gains and better condition of his sheep or greater economy in the cost of feeding, and he should be watchful of both these factors. And he should remember that economy in feed does not mean stinting or cheap feed but that it means the feed which will produce the best condition at the least cost.

It has been our observation that too many farmers proceed on the assumption that the only necessity is to simply keep the breath of life in their sheep during the winter and leave them to themselves to get in good condition on grass during the summer. Many a time have we seen a good flock of sheep so thin in flesh that they could barely move when the farmer's bins and cribs were bulging with good grain which he was keeping to sell, when if he had put it into his sheep it would have brought him an hundred fold more in the returns from his wool and lamb crop. A few oats or a little roots once a day will be worth more when put into your sheep than arketed in any other way.

Another very essential factor in the good health of the flock during the winter is exercise and plenty of fresh air. Often have we seen flocks put in one pen and kept there without being turned out more than once a week or even once a month; and with this would often be a single ration of hay, and sometimes that clear timothy.. Such methods can only produce loss and the wonder is that the sheep live at all. Every flock should have the run of a good sized yard or field, and the shed should never be closed tightly. The sheep have their fleeces to keep them warm, while they need exercise just as does a man to keep them in condition.

A change of rations are also a factor in keeping them thriving. Variety is the spice of life with a sheep the same as with anything else. A feed of nice bright oat straw two or three times a week and a feed of good clover hay every morning and night, with grain once or twice a day depending on whether the flock is lambs or old sheep, makes a varied and very economical ration which will produce satisfactory results.

Another good thing is to put a little brine on the straw once or twice a week; it acts as an appetizer and they eat the straw better. There are many other such little attentions which the observing caretaker can do to add to the growth and profit of his flock during the winter, and he will find that nothing responds better nor gives larger returns for the care and feed expected than does that flock of "woolies."

Have Sows to Farrow Early.

Now is the time to prepare to have spring litters farrowed the early part of April. Sows to farrow at this time must be bred early in December Even if it is necessary to wean the fall litters a little eary, it will pay better to do this than to have the sows farrowing late in April or May.

Pigs that go on the market at about seven months of age weighing upwards of 250 pounds each, usually are the most profitable, and as the market in September is usually about a cent higher than at any other time during the fall, no time should be lost in getting hogs ready for that market. Some feeders seem to be able to get their hogs to 250 pounds at six months of age, but in general they are the exception. Then again, there is always a limit to profitable forcing as it is usually done by feeding high priced feeds. In the majority of cases this is not profitable, as hogs that do not require such rapid forcing can be fed almost entirely on green crops during the time they are growing. These can easily be arranged for from May until August. The hogs in the meantime require very little grain.

Difficulties sometimes arise at farrowing time, as frequently the weather is cold. The sow must have a warm pen, or there is always danger of losing the little pigs. A few days previous to the date of farrowing the sow should be separated from all others and placed in a pen not less than 8x10 feet, and supplied with just enough short bedding to keep her off the floor. If she is provided with an abundance of bedding, she will use it all in making her nest; which is so often the cause of little pigs getting crushed by being laid on by the sow.

A board about six inches wide should also be placed about six inches from the floor against the wall in such a way that in case the sow should lie down when a little pig is behind her it will be pushed under the plank and not be crushed. A farrowing pen arranged in this way will save lots of little pigs, especially with old sows.

Sows that farrow in April should be watched closely, and if the weather is cold, an attendant should be on hand to remove the young pigs as soon as they are farrowed. Place them either in a box or basket, and take them to a warm place immediately, or have a jug of hot water set in the box so that the little pigs getting warm will gain strength. Just as soon as they are all farrowed place them all back with thesow and see that every pig sucks. Then again put them back into the basket for two hours, when they should suck again. If the weather continues cold they must be handled in this way for twenty-four hours. After that time they can be given to the sow, and if they are fairly strong they will require very little extra attention except carefulness in feeding the sow. She should be given light, sloppy feeds for two or three days until both sow and pigs get active and strong. If a little care is given them the little pigs will begin growing at once, and be ready to wean at six or eight weeks of age. Make the little pigs take plenty of exercise while they are nursing, especially if the weather i s cold, to prevent them from becoming too fat. They will

PLEURO-PNEUMONIA AND BRONCHITIS

Brought Mrs. Baker to Death's Door. Father Morriscy's No. 10 Saved Her.

Of the many hundreds of cures wrought by Father Morriscy's No. 10 (Lung Tonic) few are more remarkable than the saving of the life of Mrs. John S. Baker, of 164 Rockland Road (North End), St. John, N.B. She wrote on Oct. 16, 1909:

"I wish to express my gratitude that I am living to-day, saved from the grave by Father Morriscy's No. 10 (Lung Tonic). This time last year I had pleuro-pneumonia and bronchitis, and had been given up to die, and had my lungs tapped in the City Hospital, and never expected to walk again; I was continually getting worse every day. I came home from the hospital, and everyone was watching fo me to die. I tried everything but there seemed to be no cure for me.

"I began taking Father Morriscy's No. 10, and the second day I could eat without pain. I used 22 bottles of No. 10, as I was run down right into consumption, and for six months was just a shadow until I began to use it, and now I am in good health, and surprised most of my neighbors by gaining so quickly. I feel it my duty to publish it everywhere I can, as with all I can say I cannot recommend it too highly—it was a life saver to me, and I am very thankful to recommend it, as it is worth all it is said."

Father Morriscy's No. 10 is very different from the many preparations that simply relieve a cough. No. 10 relieves the cause of the cough, restores the membranes of throat and lungs to a healthy condition, and tones up the whole system, giving strength to resist future attacks.

Trial bottle 25c.—regular size 50c. At your dealer's or from Father Morriscy Medicine Co., Ltd., Chatham, N.B. 92

grow strong and active and be free from thumps and scours, and there will be very little difficulty in getting them ready for the September market.

Distention of Rumen.

This form of indigestion is causes by the animal gorging itself with food, and arises more from the animal's voracious appetite than from any defect in the quality of the food supplied to it. The condition is, however, more severe if the food consumed is especially concentrated or difficult of digestion. In cases of this kind there is comparatively no great formation of gas, and the gas which is formed is diffused through the stomach instead of accumulating in a layer in the upper part. On pressing the flank with the closed fist the indent of the hand remains for a short time in the flank, as if the rumen were filled with a soft, doughy mass.

This form of indigestion should be treated by stimulants, such as alcohol, wine, or aromatic spirits of ammonia.

If the formation of gas is not great and the distension with a solid material is somewhat limited, the animal may be drenched through a piece of ordinary garden hose, one end being inserted in the animal's mouth like the neck of a bottle, and the other end fitted with a funnel, giving one and one-half pounds of Epsom or Glauber's salts dissolved in two gallons of water, at a single dose. Immediately after this treatment the left side of the animal, extending below the medial line of the abdomen, should be powerfully kneaded with the fist, so that the impacted food mass will be broken, allowing the water to separate it into small portions, which can be carried downward for the process of digestion.

But if the treatment applied fails and the impacted or overloaded condition of the rumen continues, it may become necessary to make an incision with a sharp, long-bladed knife in the left flank, commencing at the point where it is usual to puncture the stomach of an ox, and prolong the incision in a downward direction until it is long enough to admit the hand. When the point of the knife is thrust into the flank and the blade cuts downward, the wall of the stomach the muscles, and the skin should all be cut through at the same time. Two assistants should hold the edges of the wound together so as to prevent any food slipping between the flank and the wall of the stomach, and then the operator should remove two-thirds of the contents of the rumen. This having been done, the edges of the wound should be sponged with a little carbolized warm water, and the lips of the wound in the rumen being turned inward, they should be brought together with catgut stitches.

The wound penetrating the muscle and the skin may then be brought together by silk stitches, which would pass through the entire thickness of the muscle and should be about one inch apart. The wound should afterward be dressed once a day with a lotion and the animal covered with a tight linen sheet, to protect the wound from insects and dirt. The lotion to be used in such a case is made up as follows: Sulphate of zinc, 1 dram; carbolic acid, 3 drams; glycerin, 2 ozs.; water, 14 ounces; mix. It is clear that this operation requires special skill and it should be attempted only by those who are competent.

Buy Your Christmas Presents at

SIMPSON'S

We Pay Delivery Charges on Every Article in this Christmas Catalogue to any Destination in Canada

How far will my Christmas Money Go?

You Will Be Asking That Question Soon

It will go much further than you think—if you order your gifts from this Special Christmas Catalogue—just issued.

Suppose you could take your time about your Christmas buying—wouldn't your money go twice as far as if spent in a few hurried, crowded shopping hours?

Think of spending a whole day—a week—in our great store—looking over our extensive stocks, comparing prices and making out lists of the presents you would like to buy.

That's just what you do when you buy through Simpson's Special Christmas Catalogue.

We have a copy of the catalogue for you, just waiting for your name and address. It's free—send for it now.

WE PAY DELIVERY CHARGES on every article shown in our Christmas Catalogue. You buy just as cheaply as though you lived right here in Toronto, and you ship the goods back *at our expense* if you don't like them when they arrive—*and get your money back.* This means, of course, that we are going to be very careful about sending exactly what you order.

Our general mail order catalogue enables you to buy—at Toronto prices—almost anything shown in our great store. *We also pay delivery charges on all goods* shown in our General Catalogue with the exception of a very few heavy, bulky articles.

Just write on a post card: "Please send me Christmas Catalogue No. 8 ." We will send it by return mail, prepaid.

The Robert SIMPSON Company Limited
TORONTO

To be genuine it must bear the name "Bissell"

Because of the great success of the "Bissell" In Throw Harrow several of its features have been imitated on other harrows. But no other harrow will give equal results unless it is built EXACTLY the same. The plates of the "Bissell" could be put on other harrows, but they wouldn't cut deep into the soil and stir it up thoroughly like they do on the "Bissell." The reason why the "Bissell" has such wonderful capacity is not due alone to the shape of the plates, nor to position of frame and seat, but because all parts are in the correct proportion. If you want the In Throw Harrow that wins every field test make sure the name "Bissell" is stamped on it. Write Dept. M. for booklet describing both our In Throw and Out Throw Harrows, and our 16 plate Wide Cut Harrow, which we make especially for the West.

THE HORSE.

Separating the Foal.

When well halter broken and taught to eat grain, weaning can be done without checking its growth appreciably. One of the best methods, is to place the dam and foal in adjoining box stalls with a small opening through which they get their noses together. Discontinue the grain ration of the dam. Feed her only dry hay and water her often but sparingly, in order to prevent the secretion of milk. For the first four days after separating, allow the foal to suck three times a day. For the next four days, twice a day, morning and night, will be often enough to let it suck. After this let the foal suck once a day for two or three days and then do not allow it to go near the dam again. If two stalls are not available, use two open stalls which adjoin, but see that an opening is made between them through which the dam and the foal may get their noses together.

To tie the foal a good stout ring should be placed on each side of the stall and a rope or tie-strap should go from each to the foal's halter. These rings should be high enough so that there will not be any danger of the foal stepping over either rope when the head is lowered to the floor. A large, light and well-ventilated box stall without feed box, water pail or manger is the safest place for a foal during weaning. The youngster can be led out to water at frequent intervals or a bucket can be placed in his stall for him to drink out of and be removed when he is finished. Feed should be given in a shallow box placed on the floor, the box also being removed when he has eaten.

Kendall's Spavin Cure

The cure that saves horsemen and farmers millions of dollars every year.

It is known the world over as the one certain, reliable remedy for Spavin, Curb, Splint, Ringbone, Bony Growths and any Lameness.

Cases just developing and old, stubborn sores and swellings readily yield to the wonderful curative powers of this famous remedy.

Orangeville, Ont., Dec. 21, '08

"We had a horse which was getting very lame on account of a Spavin. I was anxious about him as we could not work the beast when we most needed him.

Our teamster saw Kendall's Spavin Cure in the store and tried it.

I am pleased to say he had success as the horse has stopped limping and is doing his day's work."

W. A. NICHOLSON.

Don't worry about Spavins, Growths, Swellings or Lameness, but use Kendall's Spavin Cure. It cures every time. The world's best liniment for man and beast.

$1. a bottle—6 for $5. Get our book "A Treatise On The Horse," free at dealers or from us.

HORSEMEN ATTENTION!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. They cure Cough, Cold, Distemper, Colic, Glanders, Spavin, Pink eye and all diseases of the Horse.

TRURO, N. S.

Dear Sirs,—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse liniment. The cough was of twelve months standing. In my large expeience with horses, I consider this liniment to be the best made for all diseases of the horse, and I recommend it to my friends.
E. J. ANDERSON.

BEAR RIVER, N. S.

DEAR SIRS,—
We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it.
Yours truly,
CLARKE BROS.

The Grain Ration.

The grain ration for the foal when being weaned should consist of ground or whole oats, preferably the former, two parts to one part of wheat bran. Begin with a light ration and increase daily until the foal is eating from three to six quarts of the grain ration. For a good-sized foal four quarts of oats, and two of wheat bran, daily, divided into three feeds will be none too much.

Feed the foal well cured hay, the best and earliest cut hay available. Feed only as much as it will eat with a relish, but feed often. If there is plenty of cow's milk to be obtained teach it to drink sweet skimmed milk. Most foals easily learn to drink milk but some refuse. To such begin by wetting oat-meal with milk, making the mixture thinner each time until soon the colt will be drinking clear milk. A lump of rock salt or a salt brick should be placed in the stall where the foal can help itself whenever he wants to. Exercise is absolutely necessary in order to insure the foal's well-being. As soon as weaned, the youngster should be given a paddock or pasture to run in when the weather is good so that his limbs may be developed in proportion to his body. Keep the feed box and the stall clean Look after the feet and by the use of a rasp keep them from growing irregularly or getting too long.—J. R. James in Farm and Dairy.

The Horse's Foot.

In considering the diseases to which horse flesh is heir, there are two things that should always be considered as of special importance; the teeth and the feet. The average period of usefulness of the horse is curtailed several years by the inadequacy of the teeth. In most horses at the age of fifteen the teeth have become rough and uneven, and from that time on the horse is a hard keeper and the real cause is not known by the owner. In buying horses the teeth and the feet should receive most careful examination. Ordinarily, in speaking of the feet of the horse, we mean the part inclosed by the hoof wall. Looking at it from a stanpoint of comparative anatomy the foot includes all below the knee and the hock. The artificial conditions under which the horse is placed and the unusual demand exacted of him result in almost every case in diseased conditions which render him incapable of doing the work he would otherwise do. Shoeing, which places him under artificial conditions, combined with the hard roads, over work, and improper feeding, soon produce inflammatory conditions which may result in side bones, ring bones, coffin joint, lameness, cracks in the hoof wall, contracted heels, and a great many more diseases too numerous to mention. In many cases the horse must be shod; but there certainly is far too much shoeing done. It is surprising how much work the horse can do under most conditions without shoes, if he be brought gradually to the work, and a little care and judgment be exercised in this matter during the first three or four years of the colt's life. There are three things especially to be remembered if you wish to give this subject a little extra thought; first, as long as you use horses that have weak or defective feet for breeding purposes, just so long will you have horses with a predisposition to these things and you will lose money on them accordingly; second, do less shoeing; a horse with fairly good feet will not need to be shod unless he be worked on the pavement, race track, or in mountainous districts; third, do not allow any horseshoer to use the buttress on the soles of the feet, nor the rasp on the outside; do not leave the shoes on longer than four weeks without resetting.

In substance, remember that the foot is the weakest part of the horse; that the service of the horse is worth money to you. Take good care of the horse's feet!

G. H. GLOVER, D. V. M.
Colorada Agricultural College, Fort Collins.

Weaning the Foal.

Preparations for weaning the colt should be made many weeks before it is to be actually separated from its dam. One of the first things to do in the way of preparation is to halter break the foal. This is not a difficult thing to do if it is undertaken early in its life, and the earlier it is begun the easier it will be. Another thing in this preparatory course is to teach the foal to eat grain. This can best be done by feeding grain to the dam in a shallow box placed on the ground or the floor wher? the foal can easily reach it. Thelittle fellow will see its dam eat the grain and following her example will begin to nibble at it. Once it has got a taste, it will be on hand to get its share every time the dam is fed.

The best age to wean is five months but if one has plenty of cow's milk, and it is desired to wean the youngster sooner, it may be weaned at four months or even earlier. In case the foal is weaned early and milk is fed it should be diluted with water and sweetened with a little sugar.

Veteran Work Horse.

In the Pennsylvania Work Horse Parade held this summer at Philadelphia the oldest horse was 35 years old Andy, owned by the Quaker City Laundry Co., whose wagon he had hauled for 29 years, says the Breeder's Gazette. The 30-year-old patrol horse Jim has seen 22 years of city service. Bill, also 30 years old, has been worked 27 years by the building firm of W. H. Dutton and Bros. There were a number of brewery, coal, bakery, contractor, department store, grocery, dairy and teaming horses that had seen 15 to 25 years of city use. The honors for veteran drivers went to August Gross 48 years in service; Joel Topman, 43 years in service; Barney McCullion, 35 years in service; and Harry Webb, 35 years in service.

Treatment of Wounds.

If the horse steps on a nail, do not pour turpentine into the puncture. Such treatment only tends to increase the pain and inflammation. Always bear in mind that the foot can not swell like other parts to accommodate itself to the results of inflammation. This is the reason that punctures or injuries to the feet are so painful.

Soothing treatment is always recommended. Enlarge the opening made by the nail with a knife completely through the sole of the foot, and apply a linseed meal or bran poultice. Change the poultice every 24 hours, but do not poultice longer than three days at a time, for if prolonged too much, softening of the hoof is likely to be the result. The shoe should in all cases be removed and the horse have complete rest and reduced diet until recovery takes place.

There is great danger of serious injury when brood mares that are heavy with foal or that have young foals, at foot are turned loose together in small yards or paddocks. Several valuable mares have lost their lives this spring through kicks from other mares.

POULTRY.

Ventilation Problem.

How to properly ventilate a poultry house is a problem everyone keeping hens must solve. Too much or too little ventilation is injurious to the health of the flock. Hens like human beings, take cold easily in too close or too open houses. A happy medium must be found.

If the house is practically air tight the windows should be raised an inch or two, according to the temperature to admit fresh air. There should be an opening near the top of the front side, or if the house has a double roof, at the peak of the roof, where the bad air can pass off. This aperature should have a door or slide which may be left part way or wide open according to the weather. An opening at least eight inches square for every 200 square feet of house room or floor space is sufficient.

On every warm sunny day during the cold months the windows should be raised after the sun is a few hours high, and lowered at least an hour before sunset so as to give the pen a chance to warm up before the hens go to roost. The door or doors may be opened instead of the windows if screens are put in to keep the hens from getting out into the snow.

During the night two windows may be raised an inch and the slide opened about half way. One must use his judgment in regulating the ventilatian. A thermometer hung in the poultry house is of material assistance in determining whether to admit more or less air.

In a house whose front side is made of boards with cracks between them, one need not worry about ventilation, for it will take care of itself. A half century ago most farmers' henhouses were simply well attended on the north and west sides. Colds and roup rarely ever attack fowls kept in such buildings.

The ventilation problem is also solved in open-front or curtain-front houses. Such houses have roosting apartments in the rear of the pen, protected by a board or curtain partition which allows a supply of fresh air to reach the hens from underneath and the foul air to escape over head. This partition keeps out the wind and drafts and prevents the warm air from escaping too rapidly. Hens in such apartments have plenty of fresh air and are perfectly comfortable.

Colony houses should be built to admit the largest amount of fresh air possible without drafts. Houses with the two sides and back covered with paper, and having an open front covered with half-inch wire netting to keep out night intruders, serve their purpose admirably, and are properly ventilated.

Chicken coops should receive as much attention as other poultry quarters in the matter of ventilation Never close a coop tightly, but, day and night allow fresh air free access.

Study well the problem af ventilation, for upon it may hang the story of success or failure of one's poultry venture. The admittance of plenty of fresh air and the dismissal of the foul air, without drafts, to one's flocks, whatever may be their quarters, is the correct solution of the problem.—A. G. Symonds.

Keep out Dampness.

Dampness in the poultry houses during the winter months curtails egg production and impairs the helath of the flock. No matter how painstaking one may be in caring for the fowls excessive dampness in the house will minimize the daily output. In regions where the weather is more or less variable during the winter months, and where it is necessary to keep the poultry closely confined, excessive dampness is apt to collect on the siding. Its most noticeable effect is its influence on the temperature. The more dampness in the atmosphere the heavier the air, and the greater its influence on the temperature of animal life. This noticeable variation is accounted for by the humidity of the atmosphere. The same law applies to the temperature in the poultry house. If the atmosphere is more or less saturated, the temperature seems a great deal more severe to fowls and animals than if the air is light and dry.

There are numerous means of detecting dampness in the poultry-house. An experienced poultryman will notice its presence immediately on entering the house, because of his keen sense of feeling. The inexperienced poultryman, perhaps, must rely more upon other indications. The first sign of dampness is the appearance of frost upon the siding in the morning and again in the evening. If the dampness is excessive the litter will also give evidence of it. The windows will be more or less frosty. But perhaps the most striking evidence is seen in the sluggish condition of the fowls.

There are several reasons why dampness may accumulate in the poultry house in winter. Poor ven' tilation is one of the common causes. Ground floors are very productive of dampness, as they are constantly sweating. Crowding too many fowls into limited quarters is also a common cause, and one which, perhaps, produces more of this trouble than any other. Poor, leaky roofs is another of the frequent cases. It is an impossibility to keep the poultry house dry and comfortable when water from melting snow or rain drips down through the roof.

If the direct cause of dampness is improper ventilation, some means should be provided whereby the impure air can be properly removed and a fresh supply furnished without incurring draughts. For a small poultry house I know of no better or effective means of supplying ventilation than by the use of muslin. The muslin can be tacked over the spaces occupied by the window sash. In case the building is well constructed good ventilation will thus be secured without draughts.

Where too many fowls have been crowded together they should be divided into smaller flocks, and given more room for exercising. An earth floot in the poultry house answers very well if the building is so located as to give good drainage. It is an excellent plan where a ground floor is depended upon to fill in until it is 8 to 10 inches above the level outside, thus lessening the danger of dampness accumulating from this source.

Where it is the intention to handle poultry for winter egg production it is advisable to double wall' the poultry house throughout, leaving a dead air space between the outer and the inner wall. This air space materially assists in checking from coming through and accumulating on the inside of the poultry house. One of my poultry houses is double-walled, and I have never observed any indications of frost in the coldest weather. I have another house with only one course of siding, but lined with tar paper. While this answers the purpose very well, I secure my best results from the double-walled house It is a great deal easier to control the dampness in a double-walled poultry house than in any other kind.

There is indeed very little dse in trying to secure winter eggs from poultry kept in a damp house. If the building is improperly constructed it should be remodeled or carefully gone over with a view to removing the source of trouble in some way. Absorbents can be used to great advantage in any poultry house during the winter months. I have used air-slacked lime and find it an excellent absorbent. At the present time I am using rock sulphate, and secure from it about the same results. Any absorbent that will take up the dampness will answer the purpose. Frequent cleaning should be practiced, and especially during the variable weather.

Every statement concerning

Red Rose Tea is made most carefully. Every claim that has ever been advanced has been fully borne out by the tea itself. You, if you use it, have always found it good tea. So good that no other tea pleases you as well. You may try substitutes but you always return to Red Rose simply because it has the fine quality and full value that pleases and satisfies. 63

Prices: 30c., 35c., 40c., 50c. and 60c.

Make a Good Selection of Early Pullets for best Layers.

The hens selected for winter eggs must be early hatched pullets or hens that have moulted early in the season and are full feathered and ready to lay eggs.

If you have an Asiatic breed, select those pullets that were hatched in April, if those of the Mediterranean, select those that were hatched in May or June.

The house should be arranged so that you can as nearly as possible produce summer conditions, viz: warmth and dryness, and be free from draughts and have windows enough on south side to make it light and let in the sunshine. Roosts should not be over two or three feet from the floor and on a level.

Painting with pure gasoline rids the house of mites when all the coal oil and insecticides fail deplorably. For lice, a mixture made of one gallon of coal oil and 2 or 3 tablespoons of carbolic acid works wonders if you will but persist in painting roosts and nests at regular intervals of two weeks.

Then comes the 'paramount issue,' viz: the feed problem. To us country women the stories of the many things recommended, patent preparations, etc., sound very much like the wonderful menues served in the French cafes, and we throw the article down with a sigh and a feeling that our time has been wasted in reading it, for we haven't the money to invest in so many things. But we have wheat, oats and corn, also skimmed milk and scraps from the table. Then cover the floor of the hen house with litter in which to throw grain, to insure exercise in scratching for food.

For meat where rabbits are plentiful, it is a good plan to hang one (whose shin has been removed) just high enough so the hens will have to make some effort to get a bite. At butchering time the waste may be given them. Here is where a bone-cutter comes in handy and proves a profitable investment.

Let the appetite of the fowls govern the amount of feed given. Corn roasted until it is black is good to be given sometimes, and charcoal made from cobs is excellent pounded up into bits and fed to keep the digestion in a healthy condition.

Cabbage is an ideal green food and something that can be stored and given all winter. I give potato and turnip peelings cut into bits too.

The water on cold mornings should be warmed until chill is taken off, then with sharp grit, oyster shells or old plaster and a dust bath made of sifted coal ashes with a little sulphur mixed in it, and the hens dusted with insecticides to keep them free from lice, will insure the much coveted winter egg.

The question of winter egg production is all summed up in "room, exercise food, warmth and kindness." The definition of the last named in this case, is attending to details.

A Type for Laying Hens.

We see shape defined for laying hens and we see it successfully disputed, but personally I have convictions that will not move. Let me describe a good layer.

Small neck and head, a bright eye and a general neat, feminine appearance; a rather long body, with her head elevated more than her tail. Instead of dragging her feet along, she should pick them up and plump them down.

The reverse of my idea is the club-headed masculine look; her head lower than her tail; a wedge-shaped body lightest in front; an awkward, clumsy walk, with a sort of broody, dreamy look.

What about the cockerels?. Apply pretty much the same rule in selecting them. Pin your faith on the alert elevated head and the one that hunt up the knick-knacks and sort of an all-round entertainer.—M. M. Johnson.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Mrs. Bowen's Parlor and Spare Bed-Room.

Rural architecture was not the rage in Plumville; its inhabitants, as a general rule, were too much occupied in building up their fortunes. Mr. Bowen's house was a fair specimen of those occupied by the business part of the town, though, to be sure, Lawyer Green had a stone mansion fronted by a strip of land which his wife called lawn, and opposite to it rose the white Grecian temple, with huge wooden pillars fram piazza to roof, in which Dr. Dunbar resided. But Dr. Dunbar did not depend upon his practice, as all who are familiar with "Dunbar's Anti-bilious, Anti-rheumatic Panacea" and unfailing "Compound Extract of Blood-Root," warranted to save all undertaker's bills, are aware.

The Bowens were a fair representative of the "middling class," as the tradespeople in England submit to be called, though in this country we resent first and second class carriages, and accept general discomfort and confusion instead. They owned a two-story wooden house on High Street, with green shutters and a door-bell. The wing distinguished it from the Gerry's, which was, in other respects, precisely the same. The wing was only one story, however. It had been Dr. Dunbar's office when that distinguished ornament of the medical profession was a practising physician. The Bowens had altered it when they went into the house, and it had been held sacred from that time as the "spare bedroom." This was a cheerful room in itself, opening so conveniently into the parlor, though it generally had a chilly, damp feeling, from being shut up most of the year, as the Bowens had so few visitors. The sitting-room was also the dining-room and family apartment. Time had been when the meals were taken in the kitchen, and the "hired girl" had her seat at the table with the rest of the household; but Mrs. Bowen's sense of propriety had led her to be among the first of the innovators on this unpleasant custom, which gave you the mingled odors of meat and vegetables, the hissing of the just used frying-pan, or the smoke of the scorched beef-steak, by way of accompaniment to the dinner. So many of the Plumville domestics "grumbledj' at the additional steps which this reform occasioned, as well as at "not being considered as good as anybody," that Hannah, with all her faults, was a desirable "help." For her part, she preferred having her dinner by herself, and nobody around "if her beau should happen to come in a little early." The second story was entirely occupied as sleeping-rooms, Hannah's being in the attic over the kitchen.

All Plumville arranged their homes much after this fashion. They had their "front rooms"—unopened more than once or twice in a month, on the occasion of a solemn tea-drinking or a formal call from the minister—and the spare bed-room was a matter of necessity, a stereotyped appendage to gentility.

"You ain't very well this morning, mother," said Mrs. Bowen, cheerfully, as her mother-in-law came shivering to the table, on a wintry morning, wrapped in a printed woollen shawl, of a style that heralded the plaids.

"As well as I ever expect to be, 'Liza. I ain't nothing but an old cumberer of the earth and my rheumatiz is worse than ever. 'Pears to me Id rather go without breakfast 'most than to have to come over them stairs for it."

"I wish you didn't have any stairs. I'm sure I don't believe but what we could have a stove put up in your room this winter, and Kate or Johnny could just as well carry up your meals."

Mrs. Bowen brightened up with the prospect of making "grandmother" more comfortable. Hannah would grumble about another fire, and it would be just so much more expense, to be sure; but she would make the children carry up the wood, and build it herself.

"I dare say you'd like to get rid of me altagether," groaned Mother Bowen. "It's always the way old folks is treated—shoved off, and shoved off, until they're pushed out of sight and sound, and then other people's satisfied. You needn't put yourself out to make no fire for me. I know very well what's under it. I can see sharp enough, if I can't hear so well as some folks."

It was useless to remonstrate against this injustice. Mother Bowen had taken up the idea, years before that she was in everybody's way her daughter-in-laws's more especially, and every movement was colored by this suspicion.

The weather grew colder, until even Mrs. Bowen shivered in her own room, and thought that, if she envied rich people anything, it was a bed-roo fire; and it was actua,ly painful to see the old lady creep about the house, for, of course, every night's exposure to the cold above stairs increased the rheumatis , and she sat nodding in her chair behind the stove afternoons, rather than to make the exertion of going up for her usual after-dinner nap. Mrs. Bowen thought at one time of putting up a bed in the sitting-room. It was not without a precedent in Plumville; many very respectable families did so; but, apart from the inconvenience, it seemed uncleanly, since all their meals were taken there; and, giving that up, Mrs. Bowen wandered off into her front room to consider.

The parlor sofa was always her place of inspiration. Whenever she was worried and distressed, and wanted to set herself right, Mrs. Bowen had a way of going into the parlor, drawing up one window shade, rubbing a little dust off the centre-table, settling her collar in the large looking-glass, and then depositing herself in a particular corner, to think it out quietly. It was about all the use she had of the room, as she said to herself that day It had cost more than all the rest in house. The carpet, to be sure, was the same they went to housekeeping with—a white ground, with a pattern of lively colors—almost as good as it was the day it was stretched; but the chairs had been renewed, three years before, Mr. Bowen bringing home six mahogany and haircloth, with a sofa to match, from New York. He had his own share of pride, and he thought it reflected credit on his business standing to have mahogany furniture in his parlor.

Mrs. Bowen looked towards the spare bed-room door, and wondered whether Hannah had remembered to air the best feather-bed. Yes, aired and made up again, the room looking as tidy and inhospitable as spare bed-rooms usually do. The white half-curtains, with their borders of knitted fringe, were drawn together, the empty pitcher on the wash-stand was covered by a fringed towel, and tissue paper protected the gilt frame of the mirror. It had not been disturbed since Mrs. Bowen's cousin from New York had paid her summer visit; and as her sister from the country had lately removed to New York, it was not likely that its repose would be broken for some time to come. It was too bad to have a bed-room right there on the first floor, entirely unoccupied, when the stairs were so hard for grandmother yet she could not keep house without a spare bed-room—that was impossible. She never had done so nobody in Plumville did. Where would company lay off their things? and what could she do if anybody should happen to come? So Mrs. Bowen sighed at finding no solution to her difficulties, and drew down the window-blind again.

But it could not shut out the idea of the unfitness of the thing, keeping the best and most comfortable room in the house for a possibility of use, when it was really needed every day; and her journey's thither, to lay the unheard-of-proposition, threatened to make a diagonal thin place in the parlor carpet.

"I don't know but we should have to carry mother up to-night," she said, by way of broaching the subject to her husband, one cold December evening. "I had to stay and help her undress, the room was so cold, though she didn't want to let me. I can't bear to think of her dressing in such weather as this without a fire in her roam."

"That's it, the cold room; she's sofeeble, and it takes her so long. I don't see but one way. If she had the spare bed-roam, now, she'd be right on the same floor, and we could put a little stove up."

Mr. Bowen was a much startled as he would have been had his foreman proposed taking the front store for a workshop. "Why, what on earth would you do for company? Where would you put Kate?"

"She could have the big bed in mother's room, and take hers away altogether; she's getting old enough to have a room to herself, anyhow; and then, if company came, I could fix a place for her, somewhere, for a few nights."

"All very fine; but 'taint a going to do. Nobody that is anybody lives without a spare bed-room. Why, what would folks say? They'd think my business was running down right off. Too bad about mother, though; isn't it? Seems to me she gets more feeble every day; she used to be so spry. Well, fix it to suit yourself, I don't know much about such things; but I can't see such a mother as she was wanting anything that's under my roof."

"'Specting company, are you, 'Liza? Oh, my, I don't feel a bit like seeing people. Oh, my arm! I believe, if I'd known it, I'd just staid abed to-day; nobody'd a missed me, and I should have been out of folks' way! If 'twan't for those stairs, I'd go right back again. I don't see what people want to live for, for my part. Dear knows, I never did." And Mother Bowen deposited herself on a parlor chair in the most uncomfortable position she could devise.

"Won't you come in and see how we've got the spare room fixed up?" said Mrs. Bowen, who stood with a tack hammar in her hand, and con-

The flavor of Estabrooks' Coffee is always the same, because its quality never varies. If you picked one tin out of a hundred the coffee inside would be the same as in the other ninety-nine—rich, fragrant, temptingly good.

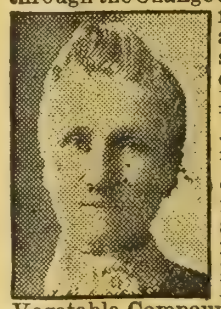
WORTH MOUNTAINS OF GOLD

During Change of Life, says Mrs. Chas. Barclay



Graniteville, Vt. — "I was passing through the Change of Life and suffered from nervousness and other annoying symptoms, and I can truly say that Lydia E. Pinkham's Vegetable Compound has proved worth mountains of gold to me, as it restored my health and strength. I never forget to tell my friends what Lydia E. Pinkham's Vegetable Compound has done for me during this trying period. Complete restoration to health means so much to me that for the sake of other suffering women I am willing to make my trouble public so you may publish this letter." — MRS. CHAS. BARCLAY, R.F.D., Graniteville, Vt.

No other medicine for woman's ills has received such wide-spread and unqualified endorsement. No other medicine we know of has such a record of cures of female ills as has Lydia E. Pinkham's Vegetable Compound.

For more than 30 years it has been curing female complaints such as inflammation, ulceration, local weaknesses, fibroid tumors, irregularities, periodic pains, backache, indigestion and nervous prostration, and it is unequalled for carrying women safely through the period of change of life. It costs but little to try Lydia E. Pinkham's Vegetable Compound, and, as Mrs. Barclay says, it is "worth mountains of gold" to suffering women.

HE WANTS THEM ALL TO KNOW

ABOUT GIN PILLS

They Cured Him and He Knows They will Cure Others

DAVISVILLE, ONT.

"I want to let you know what GIN PILLS have done for me. I had trouble with my Kidneys and Bladder so I got a sample of GIN PILLS and followed directions. I felt better after the first dose and I kept taking them for a month.

One day, Mr. Simpson of this town, told me about the trouble he had with his kidneys and I recommended him to try GIN PILLS, and gave him one to take. The next day he bought some for himself and both he and his wife have received great benefit from them. I have also induced many others to try them.

I am trying to get my sister-in-law to try them. I wish you would send me a sample box to give her."

HERBERT H. BAUER.

If you have a friend who is suffering from Kidney or Bladder Trouble or Rheumatism, send name and address, and we will gladly mail a free sample box of GIN PILLS. At dealers, 50c. a box, 6 for $2.50, or sent on receipt of price. Remember — GIN PILLS are guaranteed to give relief or money refunded. National Drug and Chemical Co. Dept. M. F. Toronto.

National Lazy Liver Pills regulate liver and bowels, and cure Constipation. 25c. a box. 66

templated her work with evident satisfaction.

"I don't know as I care about it; every step's just so much. Why, you have been getting a rocking chair an' a settee for it, haven't you? My, how comfortable it does look! Why who do you expect, 'Liza That rocking-chair looks dreadful like mine, only it is covered different. And a stove too. It feels as if there was a fire here."

It did look very comfortable, the freshly made bed, with its neat chintz counterpane and valance, the same pattern as the covers of the chair and stuffed settee. The frame of the looking-glass, and the clean china upon the washstand were shining in the sun. Kate had added her sole treasure, a gilt china vase, to the decoration of the apartment, and an old-fashioned light-stand, dark and rich with age, stood by the side of the rocking chair, turned halfway to the window. But pleasantest of all, on this chilly winter's day was the genial atmosphere diffused from a neat air-tight stove that, as Hannah remarked, "took up no more room than a band box, and het up in five minutes.'j

"You've took my light-stand, I see." And the expression of curiosity and interest on Mother Bowen's face gave place to a sharpness that occasionally varied her bemoanings. "I should have thought you might have waited till I was in my grave before you begun; 'tain't likely I'm going to last a great while, anyhow. I shall't keep you out of anything much longer; not even my house room."

"But that's just what we don't care about, mother," said Mrs. Bowen, brightly; "we want to keep you with us as long as possible, and I've been fixing up the room to make is as comfortable as I could for you.

"Some folks wouldn't be satisfied if you just lay down and let them walk over you," remarked Hannah, tartly. "If a spare room isn't a going to suit 'em, I don't know who is."

"Just come and try your rocking-chair, mother; we put a pound of new feathers into the cushion, and Johnny and Kate made this stool for your feet, so you can have the other one in the sitting-room just the same. The parlor rocking-chair is going in there for you, and when you get your bereau in that corner you'll be as snug as possible. See how far you can look down street; I had no idea so many people went by, always being at the back of the house."

"I haint got a word to say." And Mother Bowen drew out the blue silk pocket-handkerchief she still persisted in using, as the actual meaning of all these proceedings dawned upon her. "I haint got a single word. I never was so beat in all my life."

Which was the truth; for the jealous suspicion was fairly shaken, if not conquered with the tremendous sacrifice of the spare chamber to her convenience, unshorn of a single elegance, and embellished by even the best feather bed. No one could have appreciated the self-denial more fully than old Mrs. Bowen, who had been a stirring and notable housewife, priding herself on her quilts, her beds, and keeping the best of everything for company.

"I always used to think that Mrs. Bowen was sensible woman," remarked Mrs. Gerry to Mrs. Toby, who was taking a sociable tea with her; "but the way she's been going on lately! Did you hear that she a makin' a sittin'-room of her parlor this winter?"

"You don't say so! Does she let them children come in, too, all hours of the day."

"So it seems. I guess her furniture'll look well, by spring, don't you? Mary Jane, Mary Jane! Don't you hear me? Come right here, this minute. March right out to the kitchen, both of you, and don't let me hear another word tonight! My, how troublesome children are, Mrs. Toby! Just half the time, I can't hear myself think. Yes, ain't it queer about Mrs. Bowen?"

"He's doing first-rate, Toby says.'

"Well, I s'pose he is; but not a great sig ht better than his neighbors." And Mrs. Gerry reflected complacently on the recent addition to her husband's lumber yard. "It's a growing place, and most everybody's business is doing well."

"Except Toby's, seems to me." And the tired-looking woman sighed. "It does seem to me he has the worst luck."

"You know Mrs. Bowen took her spare bed-room for the old lady, two years ago." Mrs. Gerry was too much absorbed in her theme to play the consoler. "Of course that made more or less tracking over the parlor floor; so, last year, she got a drugget for it, and this year she's found out—there goes Sam. Sam, Sam! Came back and shut the door.

The half-grown boy that had passed through the room a moment before, came back sulkily.

MONTREAL, P.Q.

The Woman's Institute

There is just a little cloud appearing on the horizon, no bigger than a man's hand, as the saying goes, but it may be wafted by the four winds of heaven until it spreads all over this Province.

I refer to the organization of a Woman's Institute. In Ontario, where farmers mix pleasure with profit these Institutes have been the means of doing a great deal of good, and women living in rural districts have been vastly benefitted. In the United States also, women have these Institutes where they meet and discuss matters pertaining to the farm and home. In this way they become more up-to-date and view things from a present-day standpoint.

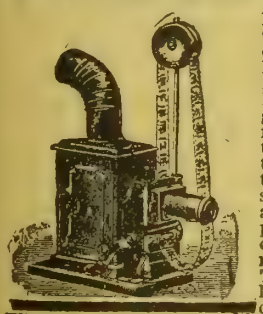
Through the agency of free schools, the younger set of farmers' wives, on the whole, are pretty well educated. Indeed, many of them are college-bred—many of them are teachers, who have married and carried their experience into homes of their own. Now how can we expect them to be satisfied with their condition, if they have not the advantages enjoyed by other classes. Woman, the world over, has one common interest—the home, and as these Institutes deal largely with domestic, social, business and spiritual life, they must of necessity throw into our existence, material for new thought and improvement.

If the women of New Brunswick are alive to their interests and ask for help along these lines, I feel sure the Government will do everything in its power to assist. In the meantime it is wise that we agitate this movement, and look for help from the proper source—woman. If we fall in, with the march of progress, a hopeful glance into the future reveals to me a happier, better time.

With our daily mails, magazines, telephones, railway accommodations, free schools and other advantages, too numerous to mention, there is no reason why rural life can not be made ideal. Most farmers have comfortable homes, and means of living, but have not yet learned how to get the most enjoyment out of each passing day; how to assimilate joys and duties—how to make duties, pleasures. Every encouragement should be afforded the things which are for the uplift and improvement of rural life, and which tends to make woman's work more interesting and therefore more easily accomplished.

AUNT BETTY.

FREE TO YOU



MOVING PICTURE MACHINE AND MAGIC LANTERN combined. If you wish to give your friends an entertainment that will make them split their sides laughing at the comic pictures get one of these machines. Makes lighter, whiter, better flavored bread —produces more loaves to barrel.

PURITY FLOUR

Old Sayings in Rhymes.

As poor as a church mouse, as thin as a rail,
As fat as a porpoise, as rough as a gale,
As brave as a lion, as spry as a rat,
As bright as a sixpence, as weak as a cat.

As proud as a peacock, as sly as a fox,
As mad as a March hare, as strong as an ox,
As fair as a lily, as empty as air,
As rich as was Croesus, as cross as a bear.

As pure as an angel, as neat as a pin
As smart as a steel trap, as ugly as sin,
As dead as a door nail, as white as a sheet,
As flat as a pancake, as red as a beet.

As round as an apple, as black as your hat,
As brown as a berry, as blind as a bat,
As mean as a miser, as full as a tick,
As plump as a partridge, as sharp as a stick.

As clean as a penny, as dark as a pall,
As hard as a millstone; as bitter as gall,
As fine as a fiddle, as clear as a bell
As dry as a herring, as deep as a well.

As light as a feather, as hard as a rock,
As stiff as a poker, as calm as a clock,
As green as a gosling, as brisk as a bee,
And now let me stop, lest you weary of me. —Exchange.

A Plain Statement.

The reason divorce was less prevalent formerly was because girls were then trained for the domestic sphere as a horse is trained for the race. But such training of our daughters was done by rule of thumb, not scientifically and thoroughly, as is now possible. Then it required many years to become a skilled housewife; but that skill was worth money, and it commanded the best husband in town. In those days a young woman famous for her housewifely accomplishments was sought after and brought a better value than we can command today.

If a woman took a husband in those days, she secured a companion, a friend, an advisar, and not merely a banker. He, too, was trained to his duties, to respect her efforts and sex, and to honor his contract, and to keep the same inviolate. The wife then had a home of her own, which she was as competent to care for as she was to mother his children and teach them to serve and respect their father. As the mother valued their companionship and loved them, so she cared for their bodies by diet and regular habits so as to produce the greatest comfort for the time, drudgery and money expended. Women and wives not so trained were derelicts then, as they are today, depleting the body politic and domestic.

Today there are so many labor-saving devices that a woman, though still the most wonderful combination of mechanic, social mentor, companion, cook, modiste, artist, wife, mother, comforter—seems to eke out a little while each day for the ornaments of life, music, etc. In order to spend the husband's money wisely she is supposed to be competent to judge the value of services performed by skilled workmen, note skilled workmen, in all the trades

Willis Pianos

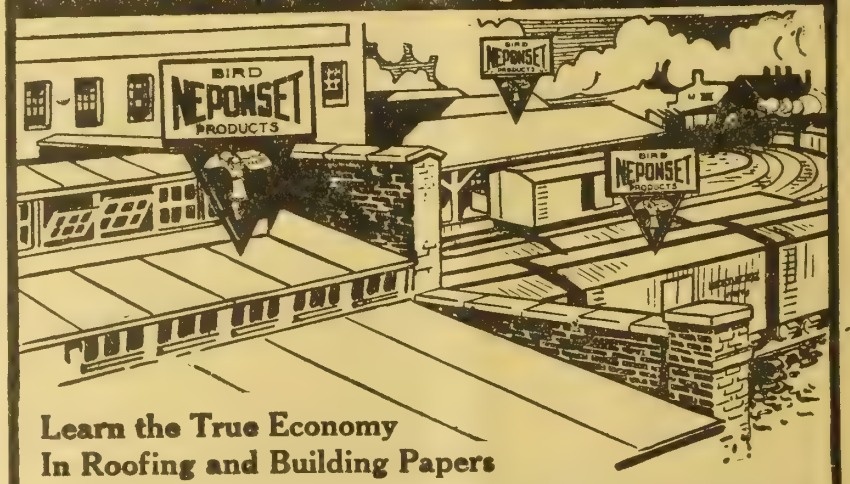
Are You Going to Build?



Learn the True Economy
In Roofing and Building Papers

The closest students of economy are the great railroad systems of this continent. In the last 20 years they have bought 75 million square feet of Neponset Roofing and insulated 75% of the refrigerator cars with Neponset Waterproof Paper.
The economy of Bird Neponset Products is just as certain for you as it is for the railroads. It is just as important for you to save the expense of repairing leaks and the cost of replacing a roof as it is for them.
There are different Neponset Roofings for different types of buildings—one kind for residences, another for industrial buildings, barns, etc., and still another for smaller structures, where low cost roofing is required.

Bird NEPONSET Products

ROOFINGS AND WATERPROOF BUILDING PAPERS

NEPONSET Proslate Roofing: For residences and all other buildings requiring an artistic roofing and siding.

NEPONSET Paroid Roofing: For roofs and sides of farm, industrial and railroad buildings.

For poultry buildings, brooder houses, sheds, and temporary buildings, Neponset Red Rope Roofing is unequalled.

NEPONSET Waterproof Building Paper: Keeps out cold, dampness and draughts. *Saves one-third the fuel bill every winter.*

NEPONSET Florian Sound Deadening Felt: For use in residences, under floors, between partitions, and under metal roofs. Absolutely sanitary.

Our Building Counsel Department is placed at the disposal of any one that is building or repairing. Give us full particulars and we will gladly give you expert advice on any roofing or waterproofing question.
Bird Neponset dealers everywhere. If you do not know the one in your neighborhood, ask us.

PFRFECT MAPLE EVAPORATOR

A first-class maple evaporator that will make **good clear**—the kind you like—syrup, w th a **very small** quantity of fuel. Price **so low** that the poorest man can buy.
Every one GUARANTEED—if not as represented **fire it back** at our expense. Sold direct to the farmer. Turns that sugar bush of yours into a paying business. Don't take our word for it. Send for our new pamphlet. It tells what the fellow who has used it thinks.

THE STEEL TROUGH & MACHINE CO,
No. 7 James St., Tweed, Ont.

employed in the supply of her own wants and the needs of her household. All this is expected of her when she is, by force of condition, barred from proper knowledge of the articles and supplies needed for the home.—Selected.

Dressing the Child.

It is about equally difficult to dress a very slender or a very large child becomingly. While it requires a good many ruffles and tucks and shirrings to fill out the hollow places in one case it requires a good deal of ingenuity to disguise the rotundity in the other. A great deal depends upon the selection of the cloth. Stripes add to one's height, while plaids or stiff heavy goods add to the apparent size. The middy blouse with skirt plaited and ironed flat will conceal the roundness and soft sheer material made without ruffling or shirring will have the same effect. Short sleeves reveal the arms and make them seem short and fat. The Russian blouse should be becoming if the child is not too old for that style of dress.Blouse waists cover the angles of the slender child while the middy blouse serves the same purpose. Full skirts joined to the waist with rows of shirring are becoming as are empire dresses, if the waist line is not raised too high and the skirt is of ample fullness. Drapes or berthas of any sort conceal angular shoulders and give breadth if they are applied near the sleeve. If used too close to the neck they make one seem narrow shouldered or hollow chested.

The Farmer's Wife.

"Above all, the conditions of farm life must always be shaped with a view to the welfare of the farmer's wifeand the farm laborer's wife. To have the woman a mere drudge is at least as bad as to have the man a mere drudge. It is every whit as important to introduce new machines to economize her labor within the house as it is to introduce machinery to increase the effectiveness of his labor outside the house.

"I haven't the slightest sympathy with any movement which looks to excusing men and women for the nonperformance of duty and fixes attention only on rights and not on duties. The woman who shirks her duty as housewife, as mother, is a contemptible creature; just as the corresponding man is a contemptible creature.

"But the welfare of the woman is even more important than the welfare of the man; for the mother is the real Atlas, who bears aloft in her strong and tender arms the destiny of the world. She deserves honor and consid?ration such as no man should receive. She forfeits all claim to this honor and consideration if she shirks her duties."—Theodore Roosevelt's address to the farmers at Utica.

Martha's Wisdom.

Washing tubs which are not in constant use will crack unless some water is kept in them.

A few drops of lemon squeezed into the water will make the darkest looking potato boil white.

To thicken peach jelly which otherwise remains too liquid use one-third tart apples to two-thirds peaches.

If a baby's ankles are weak, dissolve handlful of sea salt in a quart of rain-water and bathe them every morning and night.

After removing the baby from the bath wrap him at once in a large flannel sheet before commencing drying operations.

In buying vegetables avoid carrots beets, and similar roots that have had their green tops removed, says a veteran housekeeper.

We go to all parts of the world for the wonderful ingredients of Psychine (pronounced Si-keen). We combine these ingredients in the finest chemical laboratories in Canada, and so great is our 30-year-old faith in this preparation that we'll buy a 50-cent bottle of it from your druggist and give it to you to try.

For nearly the third of a century we have known what Psychine will do. We have known it to cure hundreds of thousands in that time, of some of the most desperate cases of disease known to medical science.

We have received thousands of unsolicited testimonials, which we will gladly let you look over should you desire.

Think of it, a third of a century's experience with one preparation, a third of a century's intimate knowledge of what extraordinary cures it has made—almost a lifetime!

Do you wonder then with that perfect knowledge of Psychine, that we are anxious to bring it to the notice of everyone in Canada suffering from disease?

Do you wonder that we want those to know who are using wrong methods of cure, who are not getting well, and who we know will be benefited by Psychine.

Do you wonder that we can buy hundreds of thousands of 50-cent bottles of Psychine from the druggists of Canada to give to those who wish to try it?

* * *

Psychine builds vitality.

It strengthens and increases the white corpuscles of the blood—the phagocytes, the policemen or scavengers of the blood.

These white corpuscles of the blood, when strong enough, destroy every disease germ that gets into the body, **keeps the body healthy.**

If these white corpuscles are not in sufficient numbers or are not sufficiently strong, then these disease germs destroy them and disease holds the body. That's the cause of nearly every disease that afflicts the human race. For years, centuries, in fact, it has been recognized that herbs are the most effective treatment for disease.

It is only within recent times that we have been able to tell just why they were so effective.

Because certain of them increased and strengthened the white corpuscles or phagocytes.

These herbs are employed in compounding Psychine.

We go all over this world to obtain these herbs. Arabia, South America, China and Japan all contribute.

And the result is a preparation that will restore health and build vitality as no other preparation will.

That has proven itself in nearly the third of a century's use as no other preparation has proven itself.

That is a most effective treatment for:

La Grippe	Bronchial Coughs
Bronchitis	Weak Lungs
Hemorrhages	Weak Voice
Sore Throat	Spring Weakness
Anaemia	Early Decline
Female Weakness	Catarrhal Affections
Indigestion	Catarrh of Stomach
Poor Appetite	Night Sweats
Chills and Fevers	Obstinate Coughs
Sleeplessness and Nervous Troubles	Laryngitis and Dyspepsia

After-effects of Pleurisy, Pneumonia and La Grippe.

Now we don't ask you to take our word for the tremendously beneficial effect of Psychine. Fill out the coupon below, mail it to us and we'll give your druggist an order (for which we pay him the regular retail price) for a 50-cent bottle of Psychine to be given you free of cost.

We will undoubtedly buy and distribute in this manner hundreds of thousands of these 50-cent bottles of Psychine.

And we do that to show our entire confidence in this wonderful preparation.

A confidence that has been based on our 30 years' experience with this splendid preparation, with a full knowledge of the hundreds of thousands of cures it has made.

COUPON No. 77

To the Dr. T. A. SLOCUM, Ltd.
193-195 Spadina Ave., Toronto

I accept your offer to try a 50c. bottle of Psychine (pronounced Si-keen) at your expense. I have not had a 50c. bottle of Psychine under this plan. Kindly advise my druggist to deliver this bottle to me.

My Name.....

Town.....

Street and Number .....

My Druggist's Name.....

Smiling.

A smiling face is often commended. It is likened to sunshine, bringing warmth and brightness to all who share its radiance. So we are advised to carry smiling faces simply as an act of benevolence to those we meet. Whether we succeed in that good intention is another matter. "Look pleasant, please," says the photographer, and the customer, being not averse to showing his best expression as well as his best clothes attempts to comply, and so comes "the photographic grin."

We all like to be regarded as having an agreeable disposition, and a smiling face is thought to indicate that we have, but the forced smile may tell a different story to one who knows how to read it. Forced smiles are disguises, and many a one can bear emphatic testimony to the truth of the saying: "A man may smile and smile and be a villain."

Theadvice to wear a smiling face is somewhat indefinite. There are as many different kinds of smile as there are various emotions. Happiness, affection, hope, confidence, amusement, condescension, surprise, derision, scorn, resentment, all these and yet other feelings, with their diverse shadings and combinations, may be expressed by smiles.

So, when we are advised to smile, it is not impertinent to ask, "What kind shall I put on?" For that is what it amounts to. If the occasion does not bring out a smile naturally, we are to put one on. We conclude that the advice is of doubtful value. If we cultivate a cheerful and sympathetic spirit and the contempt of all sorts of sham, we may let the smiles take care of themselves.

Run equal parts of cold boiled ham and English walnut kernels through the meat chopper. Mix this with good mayonnaise dressing and place between the slices of buttered bread.

In making the salad dressing the addition of one half teaspoon of curry powder instead of a dash of cayenne gives a better, more nutty flavor, besides seeming to make the dressing keep better.

FLORICULTURE.

A Hampton correspondent asks for information regarding the propagation of Horse Chestnuts, time of planting, etc., etc.

Plant the seeds or nut any time, sow out of doors in about six inches of well drained sand. When they are about six inches high, transplant carefully, without disturbing the tender roots, either in nursery rows two feet apart or they may be planted where they are intended to permanently grow, if they can be protected from dogs or other depredatious animals.

Carnations that have been recently potted from the open ground should be kept in as cool a spot as possible and be frequently sprayed. They thus bloom until Christmas.

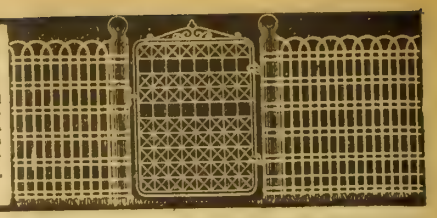
Azalias should be kept cool and frequently sprayed. Keep closely potted and give plenty of sunlight after buds are formed.

The Norway Spruce is perfectly hardy and requires no protection out of doors.

Writer says: My Chinese Primrose is looking sick. What is the matter and what can I do with it?

It is quite possible that the Chinese Primrose written about is affected by high temperature in which it is kept; 50 degrees is quite high enough for this plant. Care should be taken to keep the saucer free from water. Very little surplus moisture about the roots of this class of plants causes rapid decay. If your plants seem pot bound, turn it out of the pot and see if you are keeping it sufficiently moist. Some

Peerless Lawn Fence



Is Strong and Attractive. All the wires are uniformly crimped, large gauge, steel spring wire, heavily galvanized and coated with white enamel paint. Never sags, never rusts. times a root-bound plant will apparently be moist on top but on a closer examination the lower portion of the roots will be quite dry—this can only be ascertained by examination as directed above. It is a good idea to examine all pot bound plants occasionally in this manner.

Chatham, writes:—When should Tulip and Narcissus bulbs be put in the ground.

Tulip, Hyachinths, Narcissus and such bulbs should be planted in the ground between the twentieth of September and the tenth of November, before the ground freezes. Early in October being preferable.

The safest advice regarding your bulbs in the house is to turn the ball of earth out of the pot and if there is plenty of roots around the outside bring it to the sun but if not allow it to remain in the dark some time longer. The idea is that in putting your pots of bulbs in the dark, coal cellar, you come as near as possible to the natural habit of forming roots in the cold ground in the fall, and freezing up there, that are to remain dormant until the spring. If brought to the sunlight before the roots are formed, they will grow and bloom but the flowers will be of a very inferior quality.

Primrose, Chatham, N. B., writes:—Would you please tell me how to plants seeds of Primrose so as to make them grow? I have tried them time and again but cannot get them to grow. How deep should the seed be planted? I usually planted them about one inch deep. What is the best time to plant them? What is the best time to take slips of Geraniums and Ivies grown outside of the house?

You have been planting your seeds too deep. Sift the soil, press it down firmly in the box and water thoroughly; then sprinkle the seeds on top of this soil, scattering it as evenly as possible. For covering use fine sand or soil, sifting it very lightly over the seed, just barely covering the surface. Press all down evenly with a smooth piece of board and water thoroughly. Do not keep too wet but just moist and in a good light situation with moderate heat.

Cuttings or slips of Geraniums can be taken almost any time from now until spring. Of course the spring months are far the best as regards the percentage of cuttings rooting. By the Ivies to which you refer, I presume you mean the common Five-Fingered Ivy. The best way to get young plants of this vine is to cut out sprouts from the roots, leaving a small piece of root on attached, but almost any part of the mature wood will grow, if planted in moist earth or sand. By laying a section of vine down and covering it with soil it will be apt to root at every joint and it can be thus divided into a number of small plants.

Plant bulbs and hardy plants now, don't cover them until the ground freezes.

Daffodil or Narcissus bulbs should be planted where they may be left undisturbed, as they should then increase in number and beauty year after year, for a period of three or four years.

Plant Lily of the Valley and Narcissus under shubbery or trees and in shady places.

Scilla Tiberies, a little blue snowdrop-like flower, will soon grow wild if planted in the sod. It is one of the little early flowers of spring and lasts for a long time.

In exposed places, it is better to dig up Hollyhock roots and pack them closely in boxes of soil—plant them as it were. They will require very little water. If well sheltered a light covering of litter is sufficient protection.

Which is Your Choice?

Sloppy, leaky wooden troughs, or clean, durable Concrete?

Wooden drinking troughs are about as reliable as the weather.

They are short-lived and require replacing every few years—not to mention continual patching to keep them in repair.

The best of wood cannot withstand, for long, constant dampness and soaking. Its tendency to rapid decay soon shows itself in leaks and stagnant pools of water around trough.

Contrast with this the durability, cleanliness and well-ordered appearance of Concrete.

Which?

The dampness which destroys lumber only intensifies the strength and hardness of Concrete.

You can impair a wooden trough with comparatively little use; but it takes a powerful explosive to put a Concrete water tank out of business.

Which

is your choice—expense-producing Wood, or money-saving Concrete?

We'd be glad to send a copy of our book, "*What the Farmer Can Do With Concrete*,"—Free—if you'll ask for it. It tells the many uses of Concrete in plain, simple language—tells how to make

A WINDSOR LADY'S APPEAL.

To All Women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of rhe Womb, Painfull or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser,'. also sent free on request. Write today Address Mrs. M. Summers, Box H309, Windsor, Ont.

Dear Sirs,—I was for seven years a sufferer from Bronchial trouble, and would be so hoarse at times that I could scarcely speak above a whisper. I got no relief from anything till I tried your MINARD'S HONEY BALSAM. Two bottles gave relief and six bottles made a complete cure. I would heartily recommend it for anyone suffering from throat or lung trouble.

J. F. VANBUSKIRK.

Fredericton.

Many school children suffer from constipation, which is often the cause of seeming stupidity at lessons. Chamberlain's Stomach and Liver Tablets are an ideal medicine to give a child, for they are mild and gentle in their effect, and will cure even chronic constipation. Sold by all dealers.

Farm Problems.

Business-like Records.

Editor Maritime Farmer:—

I am sending the milk records of five of the Brooklands Farm Holsteins, bred and owned by Mr. C. H. Giles, Fredericton, N. B. Three of these records are for one year performances and the other two for a little over five months.

Lady Rose Akkrum, Sept. 14, 1909 to Sept. 14th, 1910—11,203 lbs, 12 ounces.

DeKol's Albino, Sept. 20th, 1909 to Sept. 20th, 1910—10,246 lbs, 4 oz. Eke DeKol Paul's Queenie, three years old, with first calf, Nov. 14th, 1909 to Nov. 14, 1910—10,365 lbs.

Lady Pietertje Rose DeKol, record for five months and eight days—7,038 lbs., 4 ounces.

Maid of Brooklands, record for 5 months—6,300 lbs., 8 ounces.

Lady Rose Akkrum completed the yearly record on Sept. 14th, and dropped her next calf on Oct. 3rd, without drying off—she was bound to give milk. We done all we could to get her dry but it was no use.

I would like to say a few words about Queenie and her record of over 10,000 pounds of milk, with her first calf. She was shown in Fredericton last fall, as a two-year-old heifer. There were 4 heifers in the class and only three prizes, so she was the one for the judge to put off without a prize. He said she was too fat for a dairy animal; that was to say she would make a better beef animal. Now, I would say that she is a dairy animal of the highest order, as her kind are few and far between, although she was thought by the judge not to be worthy of a prize. She is a prize herself. The beef that was on her in the show ring, went into the pail after she calved. She is a daughter of Eke DeKol Paul, whose eight nearest female ancestors averaged ove r twenty-seven pounds of butter each in seven days.

Lady Pietertje Rose DeKol dropped her calf on May 23rd. She made up a very large udder which measured six feet around it. She was a cow that was hard to dry off. We could never get her dry long enough to get any flesh on her, but this year we managed to get her dried off and get some flesh on her and the result is 7,038 pounds of milk in five months and eight days. Her best day's milk record was 70 pounds, and only milked twice a day. She gave 1,895 pounds for the 30 days of June, that tested 4.6 per cent. fat. She averaged 51 pounds 8 ounces a day for 100 days. Last year this same cow only gave 8,740 pounds in nine months. This shows what a rest and feed will do for a cow before dropping calf.

HARRY ALLISTON,
Herdsman for C. H. Giles, Esq.,
Brooklands, Fredericton, N. B.

A Cronic Sore.

A. D., Upper Haynesville, N. B.:—I have a very valuable stallion, Clydesdale, which has a small swelling on his hip close to the root of the tail, that gathers and breaks every five or six weeks and discharges bloody water when swelling goes down, seems very sore when gathering and twice of late has gathered and broke on the root of his tail, and run thick matter. Can you tell me what to do for it?

Ans.—The condition is due to an injury. Perhaps some foreign substance has penetrated the part and lodged there, or a blow may have injured the bone and fractured it, causing a splinter to become detached and remaining there it irritates the part causing inflammation, which terminates in suppuration. It would be well to have a veterinarian examine it. Discover and remove the cause. If impossible to have a veterinarian, as soon as the part becomes sensitive, bathe well twice a day with warm water until the abscess points, then make a good sized opening and explore the cavity carefully to discover if there is any pipes leading inward. If so, probe and find the cause for the recurring condition and remove it. When examining, use an antiseptic, such as a three per cent. solution of creolin or carbolic acid in water and afterwards wash out with warm water twice daily and apply one of the above antiseptics. Use a syringe to wash out with and for injecting the antiseptic.

J. STANDISH, V. S.

Lame back comes on suddenly and is extremely painful. It is caused by rheumatism of the muscles. Quick relief is afforded by applying Chamberlain's Liniment. Sold by all dealers.

Clean Your Seed

Separate and grade ALL kinds of seeds—eliminate ALL weed seed, shrunken grains, broken particles and dust. You can do it easily, quickly, thoroughly with the Chatham Fanning Mill and insure

Better, Surer Crops — Highest Market Prices

Protection for Berry Bush.

Raspberries and blackberries are nearly always sufficiently benefited by laying them down and covering with earth to make the expense and trouble more than pay. The work is done by bending the canes to the north and covering them with earth. If the canes are large, stiff, and growing in hills, the best way is to dig a forkful or two of earth away from and in the the front of the plant before bending over.

It is more convenient to begin at the north end of the row. The entire cane should be covered with earth. This work may be done any time after the leaves fall and before the ground freezes up. It cannot be done while there is frost in the canes for they will snap off.

The only pruning necessary before laying down is to remove the old canes and some of the new ones, if they are too numerous. Leave just enough of the new canes to bear a good crop the following year. If they are planted in hills and the canes are large, stocky and well branched, four to six new in a hill will be sufficient.

Horse power may be used in covering the canes by first laying them down by hand and covering the tips with enough earth to hold them in place and then plowing a furrow against the canes from each side. A man should then follow with a spade and complete the covering in spots missed by the plow.

Currants need little protection except from deep snows, which sometimes break down the branches when settling in the spring. Bushes may be protected from such injury by simply tying them together with a light rope or binding twine tightly enough to hold them up straight so that the snow cannot bend them down and break them.—A. R. Kohler, in Farm and Home.

How to Market Eggs.

A convenient and clean place should be provided wherein the hens can lay. They should be compelled to lay here in a clean nest.

It makes no difference how many hens are kept, a house suitable for them should be erected in which they should be compelled to roost and lay. Then if the nests are placed where the hens will not roost on them they can be kept clean. Straw that is dry makes the best nesting material.

If the weather is bad and the hens' feet become muddy, the eggs should be gathered at least twice daily. This will keep the eggs cleaner. If the weather is hot they should be collected at least twice each day, and oftener if the temperature is very high.

When the clean, fresh eggs are gathered, they should be put in a clean, dry, cool place until marketed. Even though the place is clean and cool, if it is not dry, mold, etc., will commence development and the eggs will soon spoil. If the eggs become damp and they happen to be in contact with any colored material they will immediately become stained. Good egg cases in a cool, dry, clean place, kept up off the floor make an excellent receptacle in which to keep eggs previous to marketing.

Before these eggs are set aside for market, they should be gone over by the farmer as he collects them, and all small, stained, dirty, doubtful, incubator and rotten eggs should be removed. Small and dirty eggs, if used immediately are just as good as large, clean ones, but they will not sell well on the market, and if sent in with good eggs will spoil the trade. Therefore, they should be kept and used at home.

No eggs should be washed, for the packers claim they will not keep well. All eggs from stolen nests, whose freshness is doubtful, and all incubator eggs, should either be brown away, boiled for the little chicks, or used at home. They should never be sent to market.

In the fall and spring eggs should be marketed at least once a week; in hot weather two or three times a week, and oftener if possible.—A. G. Phillips, in Farm and Home.

C.B. PIDGEON,
ST. JOHN, N. B.

Breeding Place for San Jose.

Osage orange hedges are a nuisance in a fruit growing country. They harbor millions of the scale. which are carried by birds and insects to the neighboring fruit trees and plants, rose bushes and other shrubs. The osage orange is so hardy that it will live in spite of the scale, and the only rational method is to do away with it entirely. If you would save your fruit trees and those of your neighbors, root out the osage orange hedges and replace them with a wire fence.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Extension to Breakwater at Lorneville, N. B.," will be received at this office until 4 00 p. m., on Wednesday, November 23, 1910, for the construction of an Extension to the Breakwater at Lorneville, Reed's Point, St. John County, N. B.

Plans specification and form of contract can be seen and forms of tender obtained at this Department and at the offices of E.T.P. Shewan, Esq., District Engineer, St. John, N. B.; Geoffrey Stead, Esq., District Engineer, Chatham, N B, and on application to the Postmaster at Lorneville, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupation and place of residence. In the case of firms, the actual signature, and nature of the occupation, and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of public Works for the sum of two thousand eight hundred ($2,800.00), dollars, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender,

By order,
R. C. DESROCHERS,
Secretary

Department of Public Works,
Ottawa, September 23, 1910.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

The Hampton Stock Farm Ayrshire Dispersion Sale.

The Hampton Stock Farm Ayrshires were sold by auction sale on Thursday, Nov. 10th. The sale was occasioned by the fact that the company was unable to get a satisfactory re-lease of the farm they recently occupied.

There were quite a number of farmers present at the sale but they were not keen bidders and consequently many of the animals were sacrificed. It was the chance of a life time for any one wishing to start a purebred Ayrshire herd. Many of the cows are exceptionally good producers and they deserved better prices. All the animals were in excellent condition and reflected much credit on their owners.

COWS.

1.—Nellie Osbourne, 3rd, of St. Annes, 10010; Ear Label No. 1; brown and white; calved September, 1899; bred, May 16, 1910 to Netherhall Nobleman; 1 ast milk record, 7000 lbs., in 14 mos.; average test 4.4 Simon Crowley, Sandy Pt., St. John, $22.00.

2.—Bessie 7th, of Auchenbrain, 16186; ear label No. 5; mostly white, with brown spots; calved February, 1903; sire, Sir Charles of Spruce Grove; dam, Bessie 4th, of Auchenbrain. This cow is an extra heavy producer. Bred, July 29th, 1910 to Netherhall Nobleman; last milk record, 7224, in 71½ mos.; average test, 4.2 Frank Armstrong, Fredericton, N. B., $47.00.

3.—Gurta, of Plantagenet, 12108; ear label No. 3; calved August 1899; sire, Isaleigh Earl; dam Bertha, Plantagenet; bred, May 8, 1910, to Netherhall Nobleman; last milk record 5192 lbs., and doing better this season. D. S. Mann, Petitcodiac, $40.00.

4—White Rose, of Kelso, 17220; ear label No. 6; white and brown, calved September, 1902; sire, Glenora Dairy Prince; dam, Maud of Kelso. This cow was sweepstake cow at St. John in 1906; her last calf was dropped, July 15, 1910, and she will likely be bred again by time of sale Simon Crowley, $72.00.

5.—Jessie, of Spruce Grove, 22235; ear label No. 8; white with few brown spots; calved September, 1904; sire, Lord Dudley; dam, Bonny Lass, of Brookhill; dropped her last calf, July 19, 1910; and she will likely be bred by time of sale; last milk record 4329 lbs., in 9 mos. J. A. Patterson & Sons, Apohaqui, $62.00.

6.—Lily, of Spruce Grove, 22123; ear label, No. 11; white with little brown on one side of head; calved December, 1904; sire, Lord Dudley; dam, Daisy of Elmshade; dropped last calf, September 5, 1910; last milk record, 5497, in 10 mos....J. A. Patterson & Sons, Apohaqui, $60.00.

7. Lady Ethel, of Brookhill, 13-875; ear label No. 7; red and white; calved August, 1901; sire, Isaleigh Earl; dam, Irene, of Brookhill; due to Calve October 7, 1910; will be fresh at date of sale. This is a very trim cow and has dropped 3 heifer calves in succession. Last milk record, 5158 lbs., in 10 mos. N. C. Cossar, Gagetown, N. B., $88.00.

8.—Gurta 2nd, of Allandale, 25405; ear label No. 12; red and white, calved August, 1906; sire, Dainty Lad, of Glenview; Dam, Gurta of Oshawa; bred September 3, 1910, to Stadaconna Conqueror; last milk record, 5343 lbs., in 11 mos., with her first calf. The dam of this cow was in our herd till last year, and is 19 years old, without a sign of breaking down. The bull this cow is now bred to is out of a record of performances cow, and his grand sire was a champion at St. Louis. N. C. Cossar, $69.00.

9.—White Rose, of Hampton, 24,-556; ear label No. 17; white, red on tips of ears; sire, Lord Dudley; dam, White Rose of Kelso; calved August, 1907; is in milk with first calf now, dropped July 29, 1910. F. Armstrong, $41.00.

10.—Gurta 2nd, of Hampton, 24947; ear label No. 19; white with red cheeks and spots on body; calved August 1907; sire Lord Dudley; dam, Gurta, of Plantagenet. W. E. S. Wetmore, Bloomfield, $44.00.

11.—Bonny Lass, of Hampton, 24,-494; ear label No. 18; with red spots on neck and head; calved August, 1907; Sire, Lord Dudley; dam, Bonny Lass, of Brookhill; is in milk with first calf now, dropped, July 17, 1910; bred, October 3rd, 1910, to Stadaconna Conqueror. G. W. Ogelvie, Little River, N. S., $50.00.

13.—Lily of Hampton, 24565; ear label No. 15; white with red spots on both sides of neck; calved August 1907; sire, Netherhall Nobleman; dam, Lily of Spruce Grove; bred, February 18th, 1910; due November 25, 1910. S. Cowley, $48.00.

14.—Ethel, 2nd of Hampton, 27676; ear label No. 30; white with red spots; calved October, 1908; sire, Netherhall Nobleman; dam, Lady Ethel of Brookhill; bred, August 25, 1910, to Stadacona Conqueror. O. W. Wetmore, $46.00.

15.—Jessie, of Hampton 27677; ear label No. 27; white with red spots; calved August 1908; sire, Netherhall Nobleman; dam, Jessie of Spruce Grove; bred in August. Herbert Monahan, Southfield, $46.00.

16.—White Daisy of Hampton; ear label No. 38; dam, White Rose of Kelso; sire, Netherhall Nobleman; all white except little fawn on tips of ears; calved August 26, 1909. J. F. Roach, Sussex. $29.00.

17.—Ethel 3rd of mampton; ear label No. 40; dam, Lady Ethel of Brookhill; sire, Netherhall Nobleman; calved, September 30, 1909. O. W. Wetmore, $34.50.

HEIFER CALVES.

Handling American Potatoes.

It will probably be a surprise to most people to learn that there have been shipped, or are in transit or stored here at the present time, about 40,000 barrels of potatoes, raised in the state of Maine. Owing to the short crop of New Brunswick potatoes this year, it has been found necessary, the shippers say, to import from Aroostook county, Maine, in order to fill the orders for the Cuban market.

One of the prominent shippers yesterday said that the potatoes are brought here and shipped to Cuba, in bond. The duty in Cuba is eleven cents less than that charged for entry into Canada. The Canadian duty is twenty-five cents a bushel. At the present time there are in the cold storage warehouse here, about 30,000 barrels of the Maine product awaiting shipment to the Havana market.

The quality of the potatoes, he said, was about the same as the New Brunswick stock. The soil in Aroostook county, just across the border from Carleton county was practically the same as the latter.

In addition to the Maine stock, there are about 35,000 to 40,000 barrels of the New Brunswick product in storage, shipped or in transit to St. John. The present price of New Brunswick potatoes is $1.25 a barrel, while the price in Maine is ninety-five cents. The American product, as stated, is shipped through this city in bond and the duty collected from the buyer in Cuba.

The almost unprecedented demand for New Brunswick potatoes in the west this year, is said to have forced the price up. About half the New Brunswick crop has already been shipped west, the dealers say. The shipments go all the way from Sherbrooke, Que., to Calgary. The western buyers are paying $1.25 and freight charges.

The shippers state that the action of the city in making the warehouse on the west side frost proof is bound to be a great help to them this season as it will double their storage capacity here. Last year, owing to inadequate accommodation here, it was necessary to hold the stock in cars, at considerable expense and risk from frost.

A COMFORTABLE SCHOOL DESK AND SEAT

is a joy to work at. An ill-fitting seat cramps your children six hours, 5 days out of the week.

We make the kind of seat and desk that fits your children like a glove.

Following are standard sizes: 36 in. double desk, 40 in. double desk, 44 in. double desk. Single desk 22 ins. long. Teachers' Tables inlaid with black enamel cloth, have two drawers full width of table.

Our school furniture is built entirely of wood—strong seasoned Hardwood Birch frame with Ash top and back—capable of standing any amount of rough usuage. No delicate castings to break.

We manufacture all kinds of Church Furniture. Ask for quotations.

THE SUSSEX MFG. CO., Limited, - - Sussex, N. B.

Popular Fancies in Foods.

Attention has recently been directed to the fact that amongst the public in this country, there is a tendency to desire foods of a certain color or appearance, quite irrespective of the fact that the same article of food of a slightly different color may be just as good, and, indeed, sometimes better. On previous occasions, this has been brought to the notice of Canadian exporters through the medium of the Weekly Report and in the course of correspondence from this office.

Taking the trade in salmon, for instance, the popular demand in this district is for red-colored fish; in fact the richest colored salmon is that most appreciated by buyers. In the egg trade too, the preference lies with eggs of a brown color when they can be obtained in place of white eggs. Pale cheese and 'buttercup yellow' butter are also in greater demand than other varieties solely because their color appeals to the public. A similar state of preference exists in the poultry trade white or black legged chickens with yellow ly preferred to chickens with yellow legs and white geese to grey colored birds. This tendency on the part of the public to desire food of a certain color or appearance also applies to many other eatables.

German Potato Crop Failure.

Commissioner W. G. Fischer reports from Berlin that the complete failure of the potato crop throughout Germany this year is likely to result in a national calamity. According to information obtained from the Deutsche Landwirtscha,ts Gesellschaft the crop both in quality and quantity will be about 25 per cent below that of a normal year owing to the inclement weather, and heavy and constant rainfalls through out the spring and summer. Large orders placed for potatoes in Saxany by French dealers have been cancelled, the quality of the goods not being up to what was required. It is anticipated that Germany will have to procure supplies from abroad this year in order to meet her requirements.

Cheap High-Priced Fowls.

Last winter a fancier paid $200 for the second prize Barred Plymouth Rock cockerel at the New York show The price seems extravagant to mgny but it proved to be a very profitable investment. He sold 463 eggs at $1 each and is raising 72 chicks from the pen which the cockerel heads. Over half of these are cockerels and the majority of them will sell at $5 to $25 each. That's a pretty good return for one year's and shows the possibilities from breeding good stock.

Report of the Sub-Committe on Education Re Bovine Tuberculosis.

The Sub-Committee on Education respectfully submit the following:—

Bovine tuberculosis has become widely distributed throughout the United States and Canada and it has been determined that efficient systems or methods for its eradication and prevention either under the supervision of the state or nation or by the cattle owners themselves are of necessity nased on the knowledge of the nature of the disease and its means of dissemination.

Experience has shown that the principles of eradication and prevention may be successfully applied by individual owners of infected cattle, independent of state assistance.

Such individual aid is essential in conjunction with state or national assistance in the prompt eradication of the disease from infected herds and the prevention of its entry to non infected herds. Therefore, it is the sense of this committee that every possible means should be employed for educating the cattle owners and the general public concerning the nature of tuberculosis; the care and precautions necessary to prevent its entrance into herds already free from the disease; and in methods for its eradication from herds where it now exists.

Further, this committee approves of the following methods for instructing laymen, practising veterinarians, practitioners of human medicine and health officers in the nature and control of bovine tuberculosis, namely:

1. By the publication in agricultural and dairy papers of short, accurate and carefully prepared articles on bovine tuberculosis.

2. By the publication of appropriate articles on bovine tuberculosis, in veterinary, medical and sanitary papers and journals.

3. By recommending to agricultural societies, granges and directors of al societies, grangers and directors of especially those interested in creameries and cheese factories that lectures on bovine tuberculosis, its nature and control, be made a part of their programs and that so far as practicable, demonstrations be held.

4. That those having in charge the arrangement of town, county and state fairs be requested to provide lectures on bovine tuberculosis and if practicable to hold public demonstrations, at their annual meetings.

5. By placing a copy of the report of the commission in the hands of the deans or directors of all veterinary and medical colleges and schools of sanitary science in the United States and Canada with recommendations that special emphasis be placed in their courses of instruction on the nature of bovine tuberculosis and methods for its control.

6. That a pamphlet dealing with the nature of bovine tuberculosis and methods for its control should be written in language intelligible to the layman. This pamphlet should have the approval of this commission and the endorsement of the American Veterinary Medical Association. It should be published for free distribution.

7. That Departments of Agriculture, state veterinarians, live stock sanitary boards and others interested in the official control of bavine tuberculosis be requested to promote as much as possible the educational features of their work, with the object of obtaining more support and co-operation from cattle owners.

The methods suggested for carrying out an educational propaganda are not to be considered at the exclusion of any and all other ways by which the public may become informed on the nature of bovine tuberculosis, its great economic importance and the necessity for an intelligent and united effort on the part of cattle owners and those having charge of the control of animal diseases to eradicate this great scourge.

The Committee is of the opinion, from the history of the legislation regarding bovine tuberculosis in those states and countries which have attempted to deal radically with the problem, as well as from the special information which has been furnished by this committee to its members, and the light thrown upon the subject in the discussions at its several meetings, that in order to avoid friction and failure.

All important legislation with reference to tuberculosis must be prepared with due consideration for the condition of public sentiment and information on this subject.

That tuberculosis control work should be developed in a progressive way.

That tuberculin tests made at a distance for public recognition (for example, in other states or foreign countries) can only be done satisfactorily by official veterinarians.

That the Delepine or Manchester plan of tuberculosis free areas gradually extended seems worthy of cautious trial.

M. H. REYNOLDS, Chairman
W. D. HOARD,
J. G. RUTHERFORD.

Report of Committee on Location of Tuberculosis in Cattle.

Your committee on the location of tuberculosis in cattle desires to submit the following as its report upon this subject. Though we are all agreed that no method for detecting tuberculosis in cattle equals the tuberculin test, we are forced to recognize that the universal application of the test under existing conditians is practically and economically impossible. The number of cattle to be tested, for example, is so great that, if all the available veterinarians and all such other persons as may be trusted to make tuberculin tests should be started on this work at once, and kept at it, years would pass before all the cattle in the United States and Canada could be tested even a single time. Consequently, our efforts to locate tuberculosis among cattle should depend primarily upon other means than the tuberculin test.

The tuberculin test should be regarded as having only an incidental value in the systematic work of locating tuberculosis, and as being of pre-eminent importance when we undertake the determination of the extent to which the disease is prevalent at any point in any herd where it has been located by other means or,incidentally by the tuberculin test.

In the order of seeming importance

THE NEW EMPRESS STEEL RANGE.

The phenomenal sale of this Range in the Maritime Provinces is the best proof of its superiority over other makes. The owner of a NEW EMPRESS does not hesitate to recommend it to their friends or neighbors. Hence the result.

The large roomy 20-inch oven; the splendid heavily lined firebox (changed to burn wood or coal by a simple turn of the shaker crank) which takes a stick of wood 27 inches long when equipped for burning wood; the large working top; the tight fitting roomy warming closet and the left hand copper reservoir, holding 36 imperial quarts with the firebox between the oven and water are some of the features of this Range.

The EMPRESS is a splendid baker and the top being of a special cast will furnish plenty of heat—being superior in this respect to other Ranges with malleable tops.

Geo. Suffren,
Jeweler,
SUSSEX, - - N. B.

the means of location may be placed as follows:

1. NOTIFICATION.—A law should be enacted requiring any and every person having knowledge of the existence of a case of tuberculosis among cattle to report the same without delay to some proper, sesignated authority. Such a law would be practically equivalent to the obligatory reporting of all clinical cases of tuberculosis which must be recognized at the most serious disseminators of tubercle bacilli and propagators of tuberculosis.

Since all cases of tuberculosis that are centers from which infection is being scattered, gradually become clinically recognizable, obligatory notification of all recognized cases of tuberculosis would alone in the course of a few years locate the majority if not all badly diseased herds. It would certainly locate tuberculous cattle and herds faster than they can be handled for some years to come.

11. EVIDENCE THROUGH MEAT INSPECTION.—A effort should be made to trace tuberculous animals back from slaughter houses to the farms from which they were derived. This is important because if the well-conditioned animals which go to slaughter for meat are tuberculous it is probable that among the animals retained on the farm some active disseminators of tubercle bacilli exist, which are retained at the farm either through ignorance or a false idea of economy.

Meat inspection has already done much to establish infected areas from which tuberculous animals have been sent to market. At present, however, it is difficult to trace animals to the farms from which they were shipped, and some method of identification by means of which any animal found on the killing floor to be tuberculous can be traced to its place or origin is greatly to be desired. A Federal law requiring appropriate tagging, branding or otherwise identifying all hogs and dairy cattle moving interstate for slaughter and state laws compelling similar identity marks for these animals moving within the state for slaughter would be the means of locating a large proportion of the centers of tuberculosis. Experimental work of this character which has been carried out in the past has given very interesting results. For instance, when the occurrence of tuberculosis among hogs at an abattoir is followed up by a tuberculin test of the cattle on the home farm is practically always discloses tuberculosis among these animals. Like much other evidence this encourages us to believe that tuberculosis among hogs will cease to exist as an economically important problem as soon as we succeed in controlling the bovine source of tubercle bacilli.

111. THE TUBERCULIN TEST.—When the tuberculin test is applied to cattle for any purpose it should be clearly understood that the reacting animals are to be regarded in every sense of the word as recognized cases of tuberculosis, which under an obligatary notification law, must be reported at once to the proper authority. In this way tuberculin will serve as an important means of locating tuberculosis among cattle that are tested for reasons like the following:

(1) To obtain healthy animals for export.

(2) To make sure that animals imported are free from tuberculosis.

(3) To make sure that animals intended for inter-state movement are free from tuberculosis. And here we would like to suggest that the states should protect themselves as much as possible against bovine tuberculosis by insisting that no new cattle shall be brought in until they have been shown by the tuberculin test to be free from tuberculosis. The time we may hope is not far off when even breeders of exceptionally fine strains of blood will begin to realize that the very best blood coupled with tuberculous infection is an article to be shunned, not because we wish to imply that tuberculosis is hereditary, but because we know how readily it is conveyed from animal to animal by contact.

(4) To obtain from animals shown in the most conclusive manner to be free from tuberculosis, irrespective of whether the milk is intended for special certification or for more general or regular city use.

(5) To satisfy an owner of cattle that his herd is free from tuberculosis or to give him the infohmation he needs to clean his herd from disease.

In whatever way the tuberculin test is applied, or for whatever purpose, all positive reactions obtained should be regarded as placing the reacting animal in the category of recognized cases of tuberculosis, which must be reported under a notification law.

As the newer methods of applying tuberculin for test purposes have not been found to be as reliable as the older, subcutaneous method, they cannot be advocated. The ophthalmo and cutaneous tuberculin tests may have a value in some cases, as for example, where doubt exists about the reliability of a subcutaneous test because an animal may have been subjected to some pernicious manipulation. In this sense these later modes of applying tuberculin should be kept in mind.

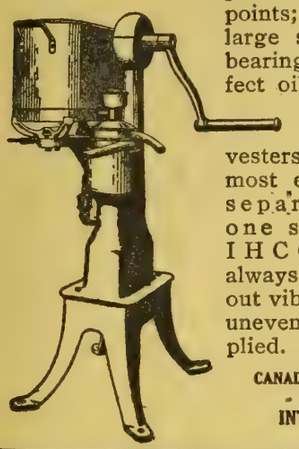
IV. EXAMINATION OF MATERIAL FROM CATTLE AND HERDS.—The valuable evidence that may be obtained as to the location of tuberculosis through the examination of milk, cream, butter, centrifuge slime and other products and materials from cattle should not be neglected, especially when these examinations are made by health officers and others for the protection of public

I H C Cream Harvester Advantages

Close Skimming — Lifetime Service — Quality Cream
Easy Turning — Easy Cleaning — Complete Line

ALMOST any cream separator will skim fairly clean when new. It is the test of time that is the proof of a separator's value. It is the years of service that count. Be sure that the separator you buy is built to work satisfactorily for a lifetime.

If you investigate, you will find that I H C Cream Harvesters are the only separators with dust-proof and milk-proof gears, which are at the same time easily accessible. You will see that the name of an I H C Cream Harvester is entirely protected from wear by phosphor bronze bushings at all points; that the I H C has large shafts, bushings, and bearings; that it has a perfect oiling system; that the flexible top-bearing of I H C Cream Harvesters is the strongest and most effective found in any separator; it has only one spring. That's why I H C Cream Harvesters are always steady and run without vibration, no matter how unevenly the power is applied. And you will also note that I H C Cream Harvesters are equipped with a patented dirt-arrester which removes the finest particles of dirt from the milk before the milk is separated. You will see that the crank is placed at the right height for easy turning, and the tank is at an easy height to fill.



There are many other advantages of I H C Cream Harvesters. See the I H C local dealer and let him point them out to you. Let him show you the different I H C styles and sizes so you can select just the machine to meet your requirements. The Bluebell is a gear drive machine—the Dairymaid is chain drive. Each style is made in four sizes, from 350 to 850 pounds capacity. Get catalogues and all facts from the I H C local dealer, or, write nearest branch house.

health, and are followed up by the inspection of the animals and the character of their environment as a routine procedure. Such inspections are constantly becoming more prevalent in various sections of the United States and Canada.

V. MOST IMPORTANT SOURCES OF ANIMAL TUBERCULOSIS.—Tuberculosis as it exists among the domestic animals of America today, undoubtedly owes its primary introduction to the cattle of improved breeding that have been imported from European lands from time to time in the past, for the purpose of improving the native stock of the country. No particular breed is to be incriminated in this charge, as several of the most prominent and popular breeds have been found gulity of furnishing tuberculous individuals to the best American herds on repeated occasions. The knowledge that infection has taken place from these sources in the past affords us a valuable indicator of the points where search should be made in our efforts to detect the cases of tuberculosis that exist today upon the farms of the country. First of all then, attention may be directed toward all herds of pure bred cattle whether of beef or dairy type, especially to those from which cattle are sold, either by private or public sale, and from which cattle are thus distributed to various parts of the country; also to herds from which members are exhibited at fairs and exhibitions and herds which keep males for custom service.

In addition to these herds of pure bred cattle there are many others to which well bred stock has been added for the purpose of grading up and improving the quality of the individuals of the herd.

Those in some instances have received the infection of tuberculosis with the new animals from which such great benefits had been expected, and these herds of well graded cattle should also be regarded with suspicion until they have been proved to be free of tuberculosis. Next in order should come all dairy cattle, but the methods by which the disease may be located in these herds has been discussed above.

DR. JOHN R. MOHLER, Chairman
J. W. FLAVELLE.
DR. C. A. HODGETTS.

The Commission's Recommendations on Eradication—a Composite of the Methods of Bang and Others.

The Commission after stating the known facts regarding the nature of tuberculosis and enumerating the principles to be observed in its prevention and eradication, recommends the following plan of procedure. It is recognized that in several points there are opportunities, in order to meet individual needs, to change or modify the directions herein given. It is understood, however, that whenever, such modifications are made they should conform in the greatest detail to the principles laid down in the report of this Commission. The plan has for its purpose the conservation of the herd whenever that is possible.

The control of bovine tuberculosis involves a definite procedure under two distinct and different conditions, namely: (1) where a herd of cattle is free from tuberculosis and it is to be kept so, and (2) where one or more animals in the herd are infected and the purpose is to eradicate the disease and establish a sound herd.

PROCEDURE UNDER CONDITION (1)—The prevention of tubercular infection in cattle, free from tuberculosis, consists simply in keeping tuberculous cattle or other aimals away from the sound ones; in keeping tuberculous animals out of pastures, sheds or stables where the sound ones may be kept. Healthy cattle should not be exposed to possible infection at public sales or exhibitions. Raw milk or milk by-products from tuberculous cows should not be fed to calves, pigs or other animals. Cars that have not been thoroughly disinfected should not be used for the transportation of sound cattle. Cattle that are purchased to go into sound herds should be bought from healthy or sound herds only.

PROCEDURE UNDER CONDITION (2)—The eradication of tuberculosis from infected herds requires for conservation of the herd different procedures according to the extent of the infection. For a guide to the control of the disease tuberculous herds may be divided into three groups, namely:

I. Where 50 per cent or more of the animals are infected.

II. Where a small percentage (15 per cent or less) of the animals are affected.

III. Where a larger number (15 to 50 per cent) of the animals are diseased.

In eliminating tuberculosis from infected herds the following procedure is recommended.

GROUP I.

Herds where a tuberculin test shows 50 per cent or more of the animals to be infected should be treated as entirely tuberculous. The procedure here is as follows:

1. Eliminate by slaughter all animals giving evidence of the disease on physicial examination.

2. Build up an entirely new herd from the offspring. The calves should be separated from their dams immediately after birth and raised

on pasteurized milk or on that of healthy nurse cows. This new herd must be kept separate from any reacting animals.

3. The young animals should be tested with tuberculin at about six months old, and when reactors are found at the first or any subsequent test—the others should be retested not more than six months later. When there are no more reactors at six months test, annual tests should thereafter be made. All reacting animals should at once be separated from the new herd and the stables which they have occupied thoroughly disinfected.

4. When the newly developed sound herd has become of sufficient size the tuberculous herd can be eliminated by slaughter under inspection for beef.

GROUP II.

1. The reacting animals should be sepatated from the non-reacting ones and kept constantly apart from them at pasture, in yard and in stable.

(a) Pasture. The reactors should be kept in a separate pasture. This pasture should be some distance from the other or so fenced that it will be impossible for the infected and non-infected animals to get their heads together.

(b) Water. When possible to provide otherwise reacting cattle should not be watered at running streams which afterwards flows directly through fields occupied by sound cattle. The water from a drinking trough used by infected animals should not be allowed to flow into stables, fields or yards occupied by sound animals.

(c) STABLE. Reacting cattle should be kept in barns or stable entirely separate from the ones occupied by sound animals.

2. Calves of the reacting cows should be removed from their dams immediately after birth. Milk fed these calves must be from healthy cows, otherwise, it must be properly pasteurized. These calves should nat come in contact in any way with the reacting animals.

3. The non-reacting animals should be tested with tuberculin in six months, and when reactors are found at the first six months, or any subsequent test, the others should be retested not more than six months later When there are no more reactors at the six months test, annual tests should thereafter be made. All reacting animals should at once be separated from the new herd and the stables which they have occupied thoroughly disinfected.

4. The milk of the reacting animals may be pasteurized and used.

5. Any reacting animal which develops clinical symptoms of tuberculosis should be promptly slaughtered.

6. An animal that has once reacted to tuberculin should under no circumstances be placed in the sound herd.

7. As soon as the sound herd had become well established, infected animals should be slaughtered, under proper inspection.

GROUP III.

Herds that come within this group should be dealt with either as in Group II., where the herd is separated, or as in Group I, where all of the animals are considered as suspicious and an entirely new herd developed from the offspring.

GENERAL PRECAUTION.

In all cases animals that show clinical evidence of the disease should be promptly eliminated. They should be destroyed if the disease is evidently far advanced, if not, they may be slaughtered for food under proper inspection.

All milk from tuberculous cows that is used for food purposes should be thoroughly pasteurized. This means that it must be heated sufficiently to kill or to render harmless, any tubercle bacilli that may be present in it. For this, it is necessary to heat the milk for twenty minutes at 149 degrees F, or for five minutes at 176 degrees F. It is important that pails or other utensils used in carrying the unpasteurized milk should not be used, unless previously sterilized, for storing the milk after it is pasteurized.

When diseased animals are found, the stables from which they are taken should be thoroughly cleansed and disinfected. To accomplish this, all litter should be removed, floors walls and ceilings carefully swept, and the floors together with mangers and gutters thoroughly scrubbed with soapand water. Thorough cleaning before the application of the disinfectant, cannot be too strongly emphasized. After cleansing, the disinfectant should be applied. A five per cent (5 p. c.) solution of carbolic acid, a 1-1000 solution of corrosive sublimate or a four per cent. (4 p. c.) solution of sulphuric acid may be used.

When the stables can be tightly closed, formaldehyde gas properly used is reliable and satisfactory.

If tuberculous cattle have been kept in a small yard the litter should be removed the surface plowed and the fencing and other fixtures thoroughly cleansed and disinfected.

WEAK MEN, HAVE COURAGE

If you get up in the morning with a dull brain, tired nerves, an ache in your back, a dread of the toil and hardships of everyday life, these are signs that your vitality is at a low ebb—that some of the organs or functions of your body are in a weakened, morbid condition.

If you are a young man, and free rein for evil habits and passions has exhausted your vital energy, or if on the shady side of forty,you have not the strength and stamina that should be possessed by a man of your years, you can regain your health, strength and energy with Electricity.

"None are so blind as those who will not see," but if you are open to conviction, and want to improve your condition, I can convince you that my Belt does all I claim for it, and even more.

You don't need to be taught that restless nights, sleeplessness, despondency, inability to concentrate your thoughts, loss of appetite, weak back, headache, pains here and there in various parts of your body, lack of energy and push, are all signs of nervous breakdown, physical debility, you know that, but what you want is a remedy that will restore the vitality that you have lost.

If you have doctored and drugged and got no benefit, that's no sign you ought to give up. Drugs can't restore your vitality. Electricity is for men like you. It's the greatest nerve builder and body builder in the world to-day.

To those who are tired of paying without results, and to those who doubt if anything will help them, I make this offer. If you secure me

PAY WHEN YOU ARE CURED

I will let you have my belt without paying me one cent in advance.

THE WORLD HATES A QUITTER.—If you go into a fight, stay with it, no matter how poor your chances look. The other fellow probably wants to quit, and if you hold your head up he will quit first.

The victory to the brave. It takes nerve and energy to win nowadays.

You don't want to be a failure. You are made for better things, but you can't win without courage, and energy.

That's the idea behind my Electric Belt, the body battery that pours electric vim into a man's body.

Wells P. O.

Dear Sir:—I have been wearing your Belt for four weeks, and am thankful to tell you that my indigestion is cured.

Yours, gratefully
JOHN V. B. FOSTER.

Dear Sir:—I bought a Belt from you in December, 1905, and I have it yet. I would not return it for twice what it cost me. It cured the pain in my back completely. Your Belt was a blessing to me.

CHAS. JACKMAN.
Box No. 55, Kilsyth, Ont.

Dear Sir:—Two years ago I purchased one of your Belts for Sciatica and Rhematism, and am pleased to say that it cured me completely. I have had no return of the trouble since.

CHAS. KELLY.
Lindsay, Ont.

I cannot take up more space with these extracts. But if you will send me your address I will mail you free my beautifully illustrated book, along with testimonials from thousands of grateful people, who have been fully restored to health and strength.

This appliance has cures in almost every town and city in the country and if you will write I will send you testimonials given to me by people that are probably well known to you. My Belt not only cures weakness, but Rheumatism, Sciatica, Lumbago, Backache, Kidney Trouble, Nervousness, Constipation, Indigestion and Stomach Trouble.

FREE BOOK.

I have a beautiful 80-page illustrated book, which I will mail, sealed, to any address FREE. This book is full of lots of good, interesting reading for men. Call to-day. If you can't call, send coupon for Free Book.

Sheep in Western Canada.

From an article by A. L. McCredie in October Farmer's Magazine, we clip the following paragraphs with regard to the sheep industry in the West:

Now consider the occupied farms of the west. Of these there are about 500,000, according to the authorities, each of 160 acres. At say 25 sheep per farm, a low average, considering the large proportion of unbroken natural pasture nat otherwise used, this would give 12,500,000 sheep on the occupied farms of the west.

On the present farms of Canada, therefore, at the average of 23 sheep on th? eastern farm and 25 sheep on the western quarter-section, our sheep would reach the total of 21,731,000. This is ten times our actual total. It is a respectable number for us to undertake to possess, yet as easy and simple as anything can be, that is so well worth while. It simply needs that every farmer should start a flock. With a beginning, on the average farm, of five ewes, the fifth year's end would see 21,800,000 sheep in Canada.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad. as noticeable as a large one. The rate for this column is one cent a word, each insertion. The PUBLISHER'S DESK.

CATTLE HAVE GROWN TWICE AS BIG AS TWO HUNDRED YEARS AGO.—It is a long cry from the four-toed horse of prehistoric times to the draft teams and roadsters of to-day, but now and again the development in breeds and species even in comparatively short spaces of time, whether of horses or of cattle, is attested by records of more recent date. An investigator into the history of the breeding of cattle says: "In 1710 Dr. Davenant, an English writer of political economy, estimated the average weight of dressed cattle did not exceed 370 pounds. In 1846 McCullock stated that "at present the average weight of cattle on the hoof is estimated at about 700 pounds." Besides the cattle of 200 years ago—hardly half the size—what monsters prime steers of today would have looked; and even our grandfathers might be moved to wondering admiration of modern stock if the process of growth and improvement had not been so gradual as to pass unnoticed. But while the farmer has been steadily improving his stock he also has found time to take big strides in the development of his farm machinery. The automobile and the aeroplane have been sensational and spectacular developments io other lines of mechanical invention, but it is by no means certain they will ever prove of the same essential benefit to mankind as those machines which, directly or indirectly, enable the farmer to till more land more easily and to gather in and market more food stuffs more quickly for the universal need. The farmer must bear in mind, however, that these modern machines, with all their delicate improvements, demand and deserve the best of treatment; and the first essential in caring for a machine is proper lubrication. The quality of oil used makes a tremendous difference in the work and wear you get from your mowing and raking machines, your reapers, harvesters and threshing machines. Experience has shown that a heavy oil is best for farm machinery, where grease cups are not used the bearings usually are a trifle loose, either by design or from wear, and a light oil soon runs off. The Imperial Oil Company, Limited, of Montreal, has been conducting elaborate experiments, extending over several years, with a view to furnishing an oil that will exactly meet the requirements of the farmers in this direction. Granite Harvester Oil is the name that has been given to this product, and important advantages are claimed for it, such as great durability, close clinging to loose boxes and worn bearings, and the "take-up" of play in a manner that greatly reduces friction and does away with rattling and jarring almost entirely. Special care has been taken to see no injurious acids enter into its composition, and it is not affected by extremes of temperature either of summer or winter.

PUFFS and other enlargements detract from the value and usefulness of a horse, and even if they do not seriously affect the action, are unsightly. ABSORBINE will reduce and cause to disappear all such enlargements, without making it necessary to lay the horse up. The report from H. P. Baker, Coatesville, Pa., under date of Sept. 29, 1910, will be of interest to horse owners—"I am a user of your ABSORBINE and have recommended it to many. Have had some wonderful effects from its use, and use it as a cure-all for everything that happens to the horse." An excellent preparation for Bog Spavin, Thoroughpin capped Hock, Big Knee, etc. On sale at druggists $2.00 a bottle or sent direct, express prepaid, upon receipt of price. Pamphlet free. W. F. Young, P. D. F., 124 Temple Street, Springfield, Mass., Canadian Agents Lymans' Ltd., St. Paul St., Montreal, Que.

It is to be expected that good goods should win recognition from time to time in our agricultural exhibitions. It is seldom that in one years honors come as generously to any firm as they have this year to the London Machinery Co., of Guelph, Ont. At the Dominion Exhibition, St. John, N. B., they were awarded a gold medal for the excellence of their exhibit in open competition. At Halifax, N. S., the judges also awarded the gold medal to this firm, and the great interest manifested by the Maritime farmers at both these exhibitions fully testified to the correctness of each award. More to be prized however, than either of these medals, is a medal awarded them by the Royal Agricultural Society of England. This society awards one medal a year for agricultural implements, etc., and that only after the most careful examination. It is therefore not only an honor to the London Machinery Co., but also to Canadian factories in general that the medal this year should come to the Guelph firm.

THE NATIONAL TRANSCONTINENTAL LINE.—About the time the report was sent out from St. Paul that Americans were returning from the Canadian West there went out from Chicago a wild story to the effect that the Grand Trunk would build or acquire a line from Winnipeg to Chicago for the purpose of diverting the traffic from the National Transcontinental Line, the report said "there is good authority for the statement." Enquiry at the Grand Trunk headquarters brings the answer that no such move is contemplated or even dreamed of. It was, however, hinted that this was only a follow-up by those who tried to construe the extension of the Central Vermont to mean the abandonment of Halifax. The Grand Trunk, it was stated, is eager and will be ready to operate the Transcontinental the moment it is completed.

ST. JOHN BUSINESS COLLEGE PENS.—We have just received a box of St. John Business College pens from S. Kerr and Son, proprietors of the College. These celebrated pens are made expressly for the St. John Business College by the Gillotts, of Birmingham, England, who are the most celebrated pen makers in the world. A box of these pens contains one gross and will be mailed by Messrs. Kerr to anyone sending the amount of $1.00

The old, old story, told times without out number, and repeated over and over again for the last 36 years, but it is always a welcome story to those in search of health—There is nothing in the world that cures coughs and colds as quickly as Chamberlain's Cough Remedy. Sold by all dealers.

BROOKLAND'S HOLSTEINS FOR SALE

I am offering for sale one pure bred Holstein bull, Eke DeKol Paul, Jr., three years old, dam, Lady Pietertje DeKol. Record day for milk, seventy pounds. Sire, Eke DeKol. This bull is also first cousin to Grace Fayne 2nd Homestead champion seven day cow of the world, 35.55 lbs. butter. Also a half-brother, six months old, out of same cow, sired by Ormsby Veeman.

Write for prices. First come, first served.

C. H. Giles, 'Phone 464 P. O. Box 119, Brooklands, Fredericton, N. B.

MAPLE FOREST STOCK FARM.

YORKSHIRE SWINE.

ADDRESS :

S. J. GOODLIFFE, - Sussex, N. B.

COVENHOVEN STOCK FARM,

ST. ANDREWS, - NEW BRUNSWICK.

We have several choice young French Canadian Bulls for sale, at very reasonable prices; also an excellent lot of young Tamworth Sows. Visitors are most welcome.

J. R. OSTLER, - - - - Superintendent.

Yorkshire Pigs

As my fall litters are all sold, I am now booking orders for early spring deliveries. Eight litters to choose from. All pigs eligible for registration.

P. L. MORSE, - - Berwick, N. S.

FREE ! FREE ! !

I have two Jersey bull calves, registered, two and six months old. Both highly bred. The granddam of the younger bull has won two firsts in the milk test at the Charlottetown Exhibition. The other bull is also bred from good milking strain. To the first person ordering either of these bulls, I will send free a B. P. Rock cockerel, bred from Maritime champion stock. Now is your chance; act quick. Other cockerels, same stock for sale.—WM. CLARK, North Wiltshire, P. E. I.

Ayrshire Bull For Sale.

Togo of Spring Brook farm 24911, Sire Barcheskie Admiral Togo, 19648, Dam Emma of Nether Craig 11077. I want to sell or exchange before January 1st, 1911. Write for further particulars,

HAROLD FALCONER
Alma, N. S.

Sunnyside Stock Farm.

In Ayrshires we are offering for sale three bull calves and females, any age. Guernsey females, any age.

Book your orders for Chester White swine. Pekin ducks $1.50 each.

Intending purchasers met at railway depot. Telephone in residence.

J. Frank Roach, - Sussex, N. B.

For Sale !

White Wyandotte Cockerels—Regal Strain.

50 Choice Cockerels, $1.00 to $5.00 each. No culls. Money back if not satisfied.

"Glenridge Poultry Yards," Moncton N. B.

You Cannot Afford Any Roofing Which is Not Guaranteed for Twenty-five Years

GET SEVENTY-EIGHT POUNDS OF STEEL TO THE SQUARE

SO put it squarely up to the next fellow who tries to sell you some roofing "as good as Oshawa Steel Shingles." Ask him to agree in writing to replace the roof free if it gives any trouble within the next quarter-century.

Then watch him dodge. See him evade. Hear him tell about Mr. Somebody, of Someplace, who roofed a barn with his roofing in 1884 and it's a good roof yet. Hark to him ask if that doesn't make you feel safe.

Tell him it doesn't prove what the Pedlar Guarantee does prove. Because that guarantee is your absolute protection against roof troubles for twenty-five years to come.

There is your roof-insurance for the future. There is a binding promise to give you a new roof entirely free, to put it on the building for you free, and to guarantee it for another twenty-five years, if your roof of Oshawa Galvanized Steel Shingles gives any roof trouble within twenty-five years from the day it's on.

There is $250,000 capital back of that guarantee. There are 48 years of honorable reputation back of that guarantee. And there is the biggest business of its kind in the British Empire back of that guarantee.

So it is plain common sense for you to refuse to buy any roofing that is not guaranteed. And the only kind that is guaranteed is this kind we make — Oshawa Galvanized Steel Shingles. Guaranteed for 25 years. Actually good for a century.

This is the Roofing For Your Money

Oshawa Galvanized Steel Shingles make the roof you can best afford for any building. They cost but five cents a year per square. (A square is 100 square feet). They are stamped from heavy sheet steel—28 gauge steel. Then they are thickly galvanized. That means they are coated with zinc—the rust defying metal—in such a way that the zinc is driven right into the steel. It cannot flake off, as it would if this galvanizing were done the ordinary way.

Thus these Oshawa Shingles require no painting. They will not rust. They cannot possibly leak.

So you are sure you will have no bother with your Oshawa-shingled roof, once it's on the building. You can depend on that; and you can doubly depend on it because you have the guarantee. Hand it to your banker or lawyer to keep for you; and know that it is good for a new roof right up to the last day of the twenty-fifth year—if the first one gives any trouble whatever.

Cost Far Less Than Wood Shingles

You must pay about the same price per square for ordinary wood shingles. They will cost you more to lay, because it is a quick and simple job to roof with Oshawa Steel Shingles—and it is no easy job to lay wooden shingles right.

And the wood-shingled roof will need repairs every year or two. Probably it will leak from the start. And it will be no real roof at all at the end of ten years, at the most.

You can be certain that an Oshawa-shingled roof will outlast a wood-shingled roof ten to one. Thus it costs but one-tenth as much.

This is the Roof That Really Protects

Oshawa-shingled roofs are not merely weather proof roofs. They are fire-proof roofs. They are wind-tight roofs. They keep buildings cooler in summer and warmer in winter.

And the building covered with Oshawa Steel Shingles is safe against lightning—far more so than it would be if it fairly bristled with lightning rods.

Put these Oshawa Shingles on a building, following the simple, plain directions that come with them, and you have a roof that is handsome enough for a city hall and that absolutely protects.

Practically an Oshawa-shingled roof is one seamless sheet of tough galvanized steel. Not a crevice for moisture to get through. No way to set fire to it. No chance for the wind to worry it. Dampness cannot gather on the under-side of it. It needs no painting. And you need not worry about it needing any repairs, for twenty-five years at least.

Isn't that kind of a roof the roof for you? Isn't that kind of a roof worth more than it costs? Isn't it the only roof you ought to consider?—since it is the only roof of which all these things are true.

Get Your Copy of This Free Book

Send your name and address to the nearest Pedlar place. Tell them you want your free copy of "Roofing Right."

When you have read that book through, you will know more about roofing than a good many experts know. It gives you facts, proofs, figures.

Get it and read it. Get it even if you don't expect to do any roofing for some time yet. It will put you right on the whole roofing question.

With the book will come a copy of our Guarantee. Study that, too, and see how fair and square and straightforward it is. See what positive protection it gives the man who buys Oshawa Steel Shingles.

Sample Shingle Free

WITH the book will come a sample of the Oshawa Shingle itself. It will interest you to study it. You will see the actual construction. You will see that the Pedlar Improved Lock, on all four edges of the shingle, makes it certain that moisture never can get through any Oshawa-Shingled roof. You will see how the Pedlar process of galvanizing drives the zinc right into the steel so it never can flake off. You will be in no doubt about which roofing after you have studied this shingle.

Send for it and the Book and Guarantee—Send now.

OSHAWA STEEL SHINGLES are made of 28 gauge steel, specially toughened and heavily galvanized to make them rust-proof. Thus they weigh about **seventy-eight** pounds to the square. With the box about 88 pounds to the square. When considering metal shingles always learn **the weight of metal** per square offered and be sure that the weight is of the **metal only.**

Make the weight test yourself. First be sure the scales are accurate. Then unbox a square of Oshawa Shingles and weigh them. Note that the weight averages 78 pounds **without the box.**

Don't go by the box weight. Some boxes weigh fourteen pounds or more.

G. A. Pedlar

Send to-day for Sample Shingle and "Roofing Right" Booklet No. 17

It Will Pay You to Pedlarize All Your Buildings

"To Pedlarize" means to sheathe your whole home with handsome, lasting and beautiful steel—ceilings, side-walls, outside, roof. It means to protect yourself against cold; against fire; against much disease; against repair-bills. Ask us and we will tell you the whole story. Just use a postcard and say: "How about Pedlarizing my house?" State whether brick or frame. Write to-day.

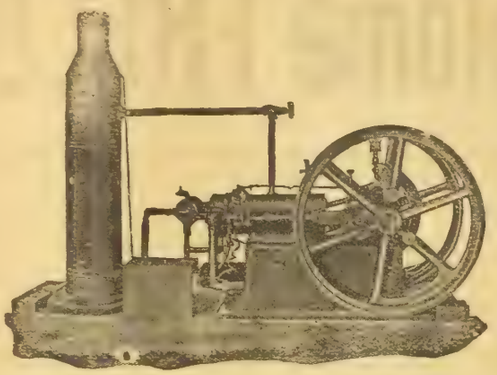
Farmers of Quality



Stationary and Mounted, in 1 1-2 to 30 Horse Power

Want Quality!

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the **"Ideal"** is interchangeable—a mighty strong feature. The cylinder instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of seating directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinder head, so that when the valves become worn, the valve cage and valve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer

"Ideal" Gas and Gasoline Engines are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price

NEW GLASGOW, - - - N. S.

You Can Furnish Your Home FREE!

ANY housewife buying goods at the stores mentioned below may have their cash purchases apply on Asepto Soap Premiums. Every cent you spend counts toward a premium. A sure and mighty convenient way to save without increasing living expenses. Over 300 premiums of honest value to select from. The list will be increased every few weeks. Furniture will be offered next. The old way was to allow premiums to apply on Soap Wrappers only. Now at any of these stores—no matter what you buy—everything ha its equivalent in Soap Wrappers. That is every five cents spent counts the same as one wrapper, while purchases of our goods as here advertised entitles you to two coupons—the one the merchant allows and the ones found in or on our goods themselves.

Dr. White's Honey Balm.—A cough syrup that is safe and sure. We are positive that no other cough syrup equals it. Price 25c. Equal to 5 soap wrappers.

Pendleton's Panacea.—The best hot medicine, in use nearly 100 years. Every person knows it is good. Price 25. Equal to 5 soap wrappers.

Brown's Cutilive.—A witch-azel cream for chapped hands, sunburn, etc. Price 25c. Equals 5 soap wrappers.

Scott's.—Salts, Senna, Sulphur, Saltpetre, Borax and Alum in 5c packages. Equal to 1 soap wrapper.

Brown's Spearmint Tooth Paste.—Sweetens the breath, prevents decay, hardens the gums and whitens the teeth. Price 25c. Equals 5 soap wrappers.

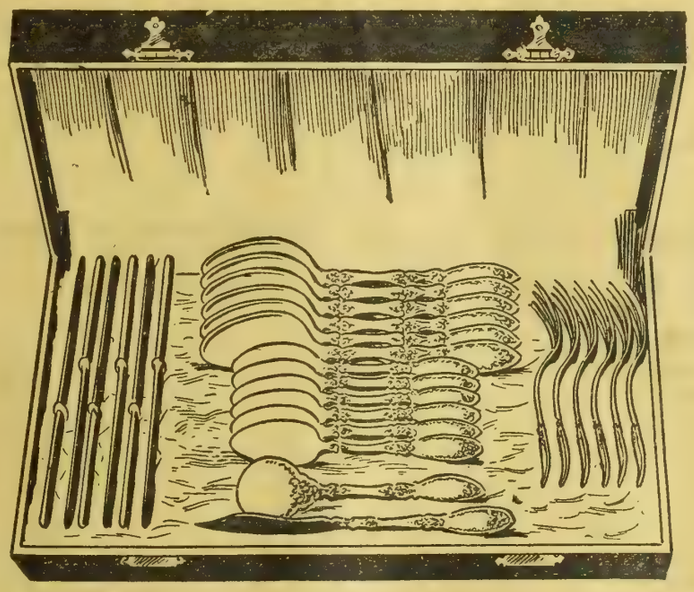
Napatho Soap.—A pure laundry soap, containing naptha and incorporated by a process that prevents it from hurting the hands, as other Napatho Soaps do. The wrappers count for premiums.

Scott's Fruit Syrups and Lime Juice.—Pure and excellent flavor. 10c, 15c and 25c. Coupon on the bottle.

Ebony Polishes—None better, bothpaste and lustre. Coupon on each box. Try them.

Sapid Tea.—A blend selling at 40c, in 1 lb. packages only. Blended by J. Harvey Brown, one of the most competent tea men in Canada. Each package carries a coupon equal to 8 soap wrappers.

Dr. Scott's White Liniment.—The largest bottle and best liniment. Price 25c. Equal to 5 soap wrappers.



Banner Spices.—In packages only. Absolutely pure. ¼ lb. packages carry coupon equal to 2 soap wrappers.

Venus Floating Soap.—Made from pure vegetable oils and unexcelled for the toilet and bath. Price 25c. Coupon counts for premiums.

Banner Flavoring Extracts.—All flavors and from 10c to $1.25 per bottle. Coupon on each bottle.

Herner's Dyspepsia Cure.—The only kind that tells you to eat what you like while taking it. Money back if not good. Price 35c. Equal to 7 soap wrappers. Price $1.00. Equal to 20 soap wrappers.

Brown's Stomach and Liver Pills.—A good family pill. Price 25c. Equals 5 soap wrappers.

Scott's Furniture Polish.—Renews the life of old furniture. Price 25c. Equals 5 soap wrappers.

Asepto Soap.—Is equal to the best and contains the same antiseptic features that Asepto Soap Powder does. The wrappers count for premiums.

Scott's.—Nitre, Glycerine, Iodine, Iron, Squills, Friar's Balsam, Carbolated Oil, Camphorated Oil, Castor Oil, Sweet Oil, Oil of Tar, Sewing Machine Oil, Spirits of Camphor. Price 10c per bottle. Equal to 2 soap wrappers.

Asepto Soap Powder.—Has been the greatest success of any soap or powder ever put on the market. This is the best evidence of its quality. It is antiseptic as well. It absolutely sterilizes every article washed. Think what this means to a family. Price 5c, and the trade mark counts for premiums.

The following stores are now in a position to explain to you what this offer means :—McLeod & Spence, Port Elgin, N. B.; F. L Rayworth, Bayfield, N. B.; W. H. Chapman, Northport and Amherst Shore, N. What One Man Has Done Another Can Do.

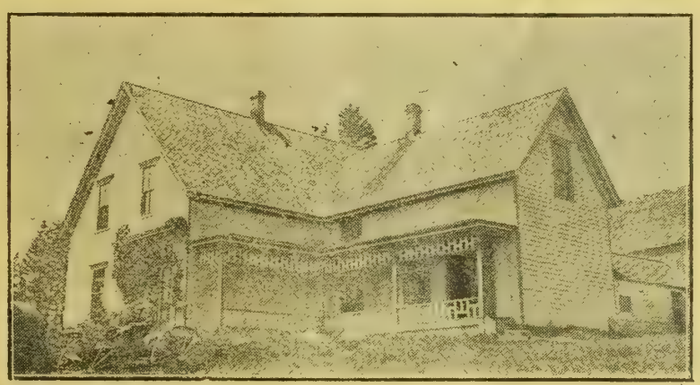
Overcoming Difficulties by Thrift and Energy.

Experiences of C. Fred Fawcett, Pioneer Farm, Up. Sackville, N.B.

A Modest Home.
But Home Sweet Home. Mr. and Mrs. Fawcett's first farm home.



Mr. and Mrs. C Fred Fawcett's New Home.
"Pioneer Farm," Upper Sackville, N. B

A Busy Day in the Potato Planting Season.
Mr. C. Fred Fawcett manipulating the spuds.

IT was our privilege to visit Pioneer Farm, the steading of C. Fred Fawcett, at Upper Sackville, N. B., early last summer. We had met him on several occasions and had a standing invitation tovisit his home, if we should be in Sackville at any time. Having visited some other friends, at Upper Sackville during the afternoon hours of a bright June day we decided to call around to see our friend "Fred" and see what he was doing. It was rather late to see much of the farming operations that night and having other engagements in Sackville that evening we decided to revisit him next morning when we could see the various operations to better advantage.

When we arrived their next morning we found Mr. Fawcett and his man busily engaged in preparing the last piece of potato land for the 1910 planting. This particular piece of land had been put in good tilth the previous day but Mr. Fawcett thought an extra discing and smoothing would be beneficial before using the planter.

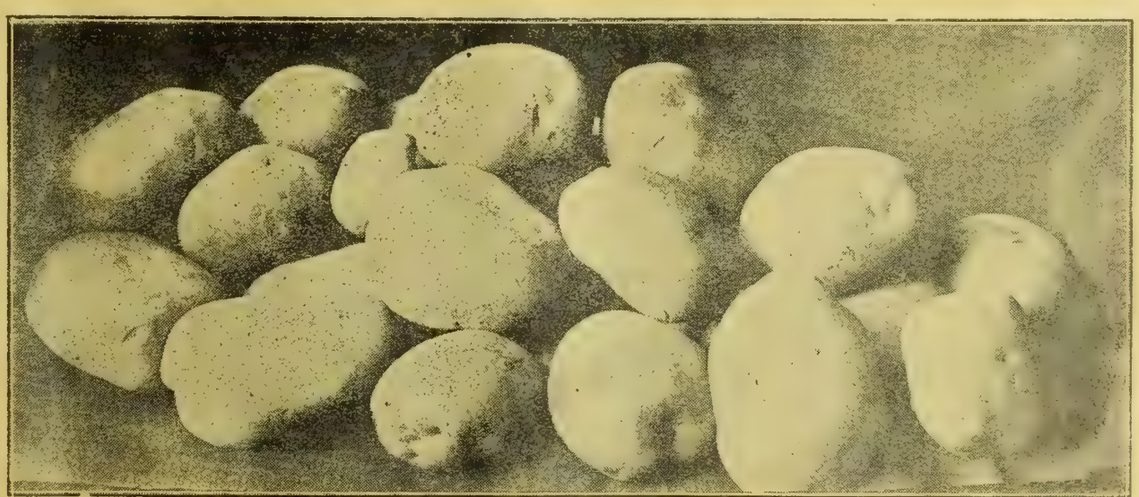
We wandered hither and thither over his home farm and from there went to another farm about a mile away, that he had bought, and where he carries on potato and grain growing on quite an extensive scale.

Mr. Fawcett, is a bright, intelligent young man, who has spent some of his earlier days at an Agricultural school and we quote the following from conversation we had with him that day and a few notes received from him since harvest time trusting some of our young readers may be benefited by some of the experiences he related:

"Upn entering married life at the age of twenty years, we had $2 in money left. From then until I was twenty-one we only put in an existence, and upon my becoming of age, I encumbered myself with personal property and real estate to the extent of $1,000 all on interest. We had a few cows and immediately purchased a separator and sent our cream to Sussex. This we carried on for a year, when we decided to purchase a home of our own. The cream checks of two months with a young colt sucking its mother at the age of ten weeks, was all we put in the place. This amount reached $100 and the balance was all on interest. This was our first home and very modest it was, but it was home. Some of our happiest days were spent on this little place of only a few acres in extent. As time went on, it transpired that this place, on account of its water privilege, became valuable, and having a chance to purchase a better home with a larger acerage, I was fortunate in selling our first home at a good profit, and turned the money into our present homestead.

My father had given me two years at Guelph when I was seventeen and eighteen years of age, and now my training was brought to the front as fast as I could get things coming my way. When I came into possession of the land, it was over-ridden with small birches and alders growing in the dead furrows. These had to be uprooted. All cannot be accomplished at once, but thanks to many a hard day's work, these do not appear now.

We sowed clover generously on all our grain sowing, and in some cases would plow this under for crop next year, whilst in others we let it mature to hay. On one field this year the after feed was very heavy—in fact one of the neighbors said it would cut three tons to the acre. All this time we had been working under very difficult circumstances and being very much handicapped



The Value of Seed Selection. Who Can Beat This Record?
The potatoes shown in the above cut were grown on "Pioneer Farm," Upper Sackville, N. B., Fred Fawcett, proprietor. Mr. Fawcett has been following seed selection in potatoes for several years by watching for hills that give the largest number of good, sound, marketable potatoes. One of the most typical Green Mountain potatoes from his highest yielding hill in 1909 was planted in the spring of 1910 and the potatoes seen in the above cut was the result. Total number of tubers in hill 31. Number marketable 27, Total weight 8 pounds and 14 ounces. Truly this demonstrates the value of seed selection. Mr. Carl Estabrooks, who works for Mr. Fawcett, certifies as follows: The hill referred to in the photo was planted and dug by me and I hereby certify that the numbers and figures are absolutely correct.

Prolific Oats.

Another convincing example of the value of seed selection. Some of the heads shown i the above cut are 18 inches long and have over 300 grains of oats in a single head. There were many like these in Mr. Fawcett's field.

for finances, we had to go very, very slowly indeed, but during the last year or two, we have almost commenced to feel as though we were beginning to farm properly.

Thinking a cash income would be secured by raising potatoes, we became interested in them and gave considerable attention to this crop. About this time we were successful in adding another fifty acres of choice upland to our farm. This land is particularly adapted to potatoes, and we immediately set about to produce that crop on as many acres as was prudent. This farm was all cut up into small fields, and quantities of large rocks were peeping out of the surface. I removed all the inside fences of this farm, and with a surveyor laid the farm off in three equal fields—on one we raise hay, one crop is taken from that, and the after-math is ploughed under for potatoes the following year. One or two crops of potatoes are taken and then the land is seeded to grain and clover. This gives us a three-year rotation, with a crop of grain, hay and potatoes each year.

In my farming operations I have so far produced some results that are highly satisfactory to me. Under the instructions of the Canadian Seed Growers' Association, I took up the selection of potatoes. The first year our hills averaged six tubers; the following year we had hills with thirteen in them and this, the third yield of thirty-one tubers from one hill. This hill weighed nine pounds when dug, but has since shrunken two ounces. Twent-seven of the potatoes in this hill were remarkable.

In our plot of selected potatoes, we had four hundred and forty hills. and lots of the hills had eighteen and twenty marketable potatoes. These potatoes were planted side by side with our regular crop, and from the time they came up until they ripened, were head and shoulders above the others. A great many visitors to the farm were especially interested in these potatoes during the past summer, and I took great pleasure in calling their attention to this work.

The plot on which we have grain this year also gave us very satisfactory yields. This field was entered in our county competition of standing field crops, and among about forty competitors, I was successful in landing tie for second place. A number of the heads were eighteen inches long, and the judge, Mr. Hector Cutten, of Truro, took one head away with him that measured thirty inches.

We also conducted an experiment with fertilizer on oats for the Dominion Potash Syndicate. This was also watched all summer by interested visitors. The time of reckoning came, and as we threshed this field out-of-doors, the different plots were easily kept track of. Potash phosphoric acid and nitrogen came out with flying colors, both in grain and straw. The seed for this field of grain was registered seed, and was bought from a member of the Canadian Seed Growers' Association.

In live stock we have not as yet been able to do very much. One or two pure bred Yorkshire sows, a couple of Shorthorn heifers, and a flock of pretty decent sheep constitute the majority. From our flock of fifteen sheep this summer, we sold lambs and wool to the amount of $75,and still have the sheep on hand. We raised sixteen hundred barrels of potatoes, five hundred bushels of grain, and ten tons of hay, besides a nice bed of turnips, on the farm this year. Another year we probably will have even more land in crop.

I have fitted up a small plot of land this fall and sowed fall wheat on it. Up till now it looks very promising.

We use commercial fertilizer very freely on all our potatoes, and in fact my experience goes to show that on most of our land manure had better be applied elsewhere. We buy the best grade of fertilizer that is obtainable, and on the general crop of potatoes apply about ten to twelve hundred pounds to the acre.

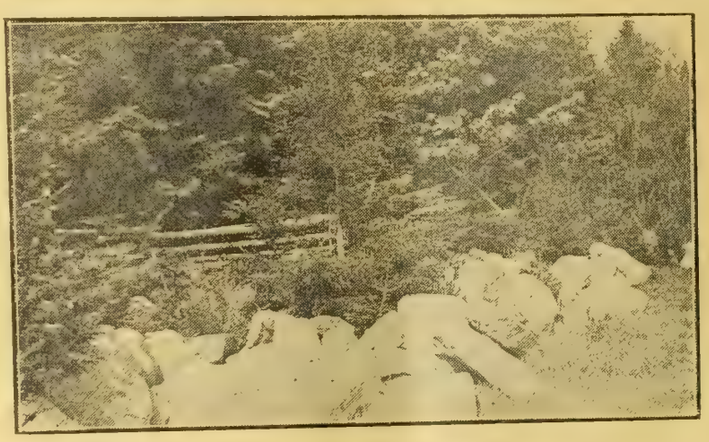
We have considerable machinery around us now, and in order to house everything I built an open front shed at one side of the barnyard, and everything is housed. I feel satisfied after two years' experience that the cost of the building was saved in one year.

I must not close this writing without saying a word for my worthy wife. She has stood by me through thick and thin, being wife, mother, and wise counsellor. To her I owe a good deal of what I have. I must say that if more of the young men, of this country would mgrry a good, sensible young woman and farm in our beautiful land of New Brunswick their labors would not be in vain.

Gentlemen, I love the farm, enjoy my work and my only regret is that I am unable at present to do more of those things that I know should be done. So far as I am able, I always uphold the banner of agriculture, and I believe there is no place where young men have such opportunities and advantages for a good, honest, servicable, profitable life than right here in New Brunswick on a well situated farm surrounded by his wife and growing family.

Like Begets Like.

Scene on a vacated farm that has been bought, cleared of the rocks, shown in another cut in this issue, and planted to potatoes. The potato hills shown in the foreground constitute Mr Fawcett's breeding plot for seed potato selecti n. When we visited this field in June, although the remainder of the field had been planted on the same date, excepting one section that had been planted on the 19th of April and which was then in blossom the tops on the selected hills were far head of the tops onother hills planted on the same date, in size of top and in general appearance



Some Freestone Rocks.

Mr. Fawcett has removed hundreds of tons like this to clear as fine an upland field as one finds anywhere in the Maritime Provinces.

A Flock of Geese Adds to the Family Income.
On Pioneer Farm.

The Nova Scotia Fruit Growers' Association.

The forty-seventh annual session of the Nova Scotia Fruit Growers' Association met in Windsor on November 28th. President Archibald was in the chair and after the opening exercises read a carefully prepared address reviewing the work of the year. Referring to the Provincial Fruit Experimental Station which has recently become an accomplished fact; to the short apple crop and lessons therefrom; to the increasing popularity of lime-sulphur spray as a fungicide; to co-operative packing and marketing, and other topics of vital interest to the fruit growing industry.

Mr. A. McNeill, of the Federal Fruit Department, took co-operatian as the subject of his address. He said looking on as a visitor from time to time to the apple growers of Nova Scotia, he had seen great advances. There are more well cultivated orchards in the Annapolis Valley than in any other section of Canada. This was a day of young men and the fruit growers present had to compete with young men. They could be assured there would be a rapid development of fruit growing in Ontario. Do not underrate British Columbia, though there had not much been produced there yet, but advertising, B. C. was going to grow apples and plenty of them. They are doing things in that country, and are going to do them. Get together, put energy and intelligence into the work and you need not fear competition. Co-operation had done great things for Denmark, for Ireland, and was already doing great things for some sections of Canada. Mr. McNeill instanced the County of Norfolk, where in 1905 apples sold at 50c. per barrel,the Norfolk Co-opergtive Association in 1910 numbered 300 members and packed 35,000 barrels of apples, selling them en bloc for $3.00 per barrel. J. N. Chute, manager of Berwick Co-operative Fruit Co., and John Donaldson, of Port Williams, spoke at some length along the same line.

Dr. H. Gordon Hewitt, Entomologist of the Dominion spoke of Insects Injurious to Fruit in Nova Scotia. Dr. Hewitt left a splendid impression on the practical men present and his future visits will be looked forward to by fruit men who heard him.

Addresses of welcome were read by Mayor Curry, A. W. Armstrong, President of the Windsor board of trade, and S. C. Dimock, secretary of the Windsor Agricultural Society. On behalf of the fruit growers, R. Eaton replied, thanking the various societies and the town of Windsor for their cordial welcome to the town.

The feature of the meeting was an address by Canon Powell, president of King's college. He chose for his theme "Efficiency in every department of life." In addressing the fruit growers and farmers, Canon Powell said he was speaking to them not as men merely engaged in money

making schemes, but as men who had an important part to work out in the destiny of Canada and the British empire, of which we form so important a part.

Principal Cumming of the Agricultural College, Truro, gave a brief practical address. He advised co-operation of their common interests, saying a united body like the Nova Scotig fruit growers, working together in a spirit of harmony for a common cause, were in a position to dictate to governments. He spoke appreciatively of the development in Canada during the past decade along agricultural and manufacturing lines. The province of Nova Scotia was not standing still when in the last ten years she had doubled her products and he felt that we had one of the finest fruit growing propositions to be had anywhere in Canada.

R. J. Messenger made a splendid speech on "The possibilities of fruit growing in Nova Scotia." In a clear-cut and convincing manner he dealt with the soil, the climate, seeing in these natural conditions wonderful possibilities for a much larger development of the fruit industry in Nova Scotia. Even in the late spring. Mr. Messenger showed the advantages to the growth and protection of plant life. His address was optimistic and being based on actual experience as a fruit grower in the Annapolis Valley carried with it the conviction it well merited.

Mr. Messenger dealt in an effe manner on the need of better transportation facilities, and also pointed out that in this respect Nova Scotia had peculiar advantages over other provinces. He spake of the need of Nova Scotia keeping at home her own men and advised more advertising and less booming of other provinces to the detriment of our own.

The first business of the association at the Wednesday morning meeting was the election of officers for the ensuing year, which was done as follows:

President—R. J. Messenger, Bridgetown.

Vice-President—A. C. Starr, Port Williams.

Secretary—S. C. Parker, Berwick.

Assistant Secretary—M. K. Ells, Port Williams.

Treasurer—G. W. Munro, Wolfville.

Executive—W. W. Pineo, F. A. Chipman, A. S. Banks, S. B. Chute.

One of the meetings closed with an admirable paper on "Profits in Orcharding," by Prof. P. J. Shaw, of the Agricultural College.

Professor Shaw's address was of special interest to the practical fruit growers, especially to those who are beginners in the work.

The closing session of the association was given to an address by Prof. M. Wallace, of Cornell University, on "The Apple Scab and its Control." This was the most important and vital discussion on the program. Prof. Wallace proved himself thoroughly at home on his subject and received a well earned meed of praise from all present. The learned professor scarcely realized however, the importance of the charge he was heralding. His expert report assuring the fruit men that lime-sulphur spray is a better and safer fungicide than the long used Bordeaux, means that copper sulphate for spraying is a thing of the past in the Annapolis Valley, while lime-sulphur will be used in tens of thousands of gallons in 1911.

The addresses and papers of the entire meeting are so practical and of such value, that in justice to the readers of the Farmer we will give them in full from time to time as space permits.

Newfoundland Agricultutal Board's First Exhibition.

For the first time in the history of the ancient colony a large agricultural fair has been held, under the auspices of the Newfoundland Agricultural Board, at St. John's, the capital of the colony.

Undoubtedly, not a few of our Maritime readers have been under the impression that Newfoundland was not, to any extent, devoting much attention to agriculture, as the mining and fishing industries had been in the lime light of prominence for so long a time that the agricultural industry was almost completely overshadowed. Despite this fact our readers, who have not been aware af anything to the contrary, will be pleased to know that agriculture is receiving a prominent share of attention in the Island colony and that the labors of the farmers are being amply rewarded as was demonstrated by the exhibition, which has just closed.

The judges were: Mr. S. J. Moore, and Dr. Standish, of Truro, N. S., and Messrs. J. R. Goadison, Wilson, Carr, Garriock, and Stick and Misses Bremer, Clatney and Seymour, of Newfoundland.

Messrs. Standish and Moore, who have just returned are loud in praise of the public spiritedness of the Newfoundland Agricultural Board and of the kindly manner in which they were treated while sojourning among them.

They relate an account of what they saw as follows: "From North Sydney, N. S., we sailed on the Reid Newfoundland S. S. Bruce and landed at Port Aux Basque, a well-protected, rock bound harbor, then travelled by train to St. John's, a 28 hours' ride through an interesting country. Beautiful bays, lakes and streams teem with fish; the valleys in places are dotted with comfortable homes and productive fields; then, there are long stretches of peat-bog, and some rocky stretches. Extensive manufacturing plants are to be seen, as well as several railway junctions, with considerable hustle, evidencing business activity along the branch lines. Finally arrived at St. John's, we found a hustling city, built on the shore of a beautiful bay that accomodates all kinds of vessels from Atlantic liners down. The city has many fine churches and schools; large, well-stocked stores; fine residences; beautiful, commodious Government buildings, and large manufacturing establishments, and is surrounded by some beautiful, productive farm lands. The Government is anxious to improve agriculture, and this year held an exhibition which was so good that it surprised themselves, as well as the visitors.

The agricultural exhibits were placed in a large Curling Rink which was certainly well filled. Prizes were offered for everything produced on a farm from a quart of cream or tub of butter to a bale of hay and a fleece of wool. In addition to the general competition open to the province, there was a separate competition for each electoral district on the Island.

The Newfoundland Agricultural Board, under whose management the exhibition was held, spared no pains and deserved great praise for the attractive manner in which the exhibits were arranged. This, the first exhibition of the kind ever held in the province or city, would, in this respect, put to shame many of our fairs, which have been an annual event for the past twenty years or more. The display of potatoes, turnips, carrots, parsnips, cabbage, etc., go to show that in the near future, with the encouragement being given by the Agricultural Board, Newfoundland will not, as now, need to import any of the above farm crops. The exhibits of grain went to show that, at least, in production of oats, Newfoundland can compare favorably with any of our Canadian provinces. One noticeable feature was the absence of rust, in the exhibits of sheaf grain, so prevalent at many of our fall fairs. One thing worthy of special note was the poultry exhibit; while it was not so large as at some of our Canadian Provincial fairs, the many representatives of the different breeds showed much careful breeding, and careful selection. Many of the best specimens would be in the money at our best poultry shows. Bales of hay from nearly every district showed, the farmers can grow, cure and put up that article as good as can be seen on any market. The Dairy stock exhibit while not numerous, showed in the high class specimens of pure bred Holsteins, Ayrshires, and Jerseys led out, that many of the farmers are alive to the importance of having the best obtainable.

The Ladies' Work, such as paintings, drawings, wearing apparel and bedding was a revelation to the fair visitors, one quilt was insured for five hundred dollars; it certainly was beautiful.

The Agricultural Board is doing good work in advancing agriculture, by importing breeding stock and seeds, securing agricultural teachers and contemplating a school of agriculture. About three thousand five hundred dollars were paid in prizes. One of the novel features in connection with the payment of prizes was that the winner could take the value of his prizes in cash or poultry or other stock. The prizes paid were substantial ones and for value outclassed many of our Maritime Fairs.

The show throughout was apparently well managed and reflected credit on the management, as this is the first of what is likely to be an annual event in St. John's. We think no one could do better than visit the next fair and enjoy the hospitality of the people of St. John's for a few days

Following is the list of prize winners:

Prize List.

HORSES.

Brood Mare, over 1100 lbs., and foal—1, Robt. Cole; 2, Peter Leary; 3, Patrick Gladney.

Brood Mare under 1100 lbs., and foal—1, Ed. Thomas; 2, Robert Cowan.

Colt or Filly, 1 to 2 years—1, Mount Cashel; 2, Michael Connolly; 3 Thomas Ebbs.

Colt or Filly, 2 to 3 years—1, Henry R. Cook; 2, Rd. O'Brien; 3, John Breen.

Colt or Filly, 3 to 4 years—1, Rd. Biddiscombe; 2, Herbert Martin; 3, David Phalen.

Honorable Mention—Jno. R. Benett, Matt Butler and Dr. Anderson.

Stallion, 1100 lbs., or over—1, Matt Butler; 2, Peter Cowan; 3, Dr. Donnelly.

Stallion, under 1100 lbs.—1, Rd. O'Brien 2, J. L. Ross; 3, C. H. Tessier.

Truck Horse, any age—1, Harvey & Co.; 2, P. Kavanagh; 3, Geo. Cook.

Carriage Horse, any age—1, Belvidere Orphanage; 2, Dr. Anderson; 3, Michael Merner.

Plough Team—1, Mount Cashel; 6, E. J. Duder; 3, Wm. Field.

Ponies, under 14 hands—1, C. H. Tessier; 2, J. Butler; 3, C. R. Thomson.

Best Horse raised in the Country—1, Rd. Neville; 2, David Phalen; 3, Mount Cashel.

T. P. U. Parade—1, C. F. Lester; 2, Philip Gourish; 3, N. J. Murphy.

General Parade—Red Ribbon, Bowring Bros.; Blue Ribbon, Bowring Bros.; Green Ribbon, Harvey & Co.

CATTLE.

Jersey female, 1 to 2 years—1, Mrs. Alex. McDougall; 2, J. L. Ross.

Jersey female, over 2 years—1, Robert Cowan; 2, Richard Drukin.

Grade Jersey female, 6 to 12 months—1, D. Galway.

Grade Jersey female, over 2 years—1, W. E. Simms.

Ayrshire female, 6 to 12 months—1, E. J. Snow; 2, Belvidere Orphanage.

Ayrshire female, 1 to 2 years—1, John Brennan.

Ayrshire female, over 2 years—1, Mt. Cashel; 2, E. J. Thomas.

Grade Ayrshire female, 6 to 12 mos.—1, E. J. Snow; 2, John Breen.

Ayrshire female, 1 and 2 years—1, E. J. Snow; 2, Jas. Cook.

Grade Ayrshire female, over 2 years—1, Thos. Ebbs; 2, Mt. Cashel.

Holstein female, 6 to 12 mos.—1, Mt. Cashel; 2, John Breen.

Holstein female, 1 to 2 years—1, Mt. Cashel; 2, E. J. Duder.

Holstein female, over 2 years—1, E. J. Duder; 2, F. H. Steer.

Grade Holstein female, 6 to 12 mos.—1, Jas. Cook.

Grade Holstein female, 1 to 2 years—1, Mt. Cashel; 2, F. H. Steer.

Grade Holstein female, over 2 years—1 and 2, Mt. Cashel.

Best Dairy Cow, any breed—1, 2, 3 and 4, Mt. Cashel.

Jersey male, 6 to 12 months—1, Francis Pelly; 2, Miss Neville.

Ayrshire male, 1 to 2 years—1 and2, E. J. Snow.

Holstein male, over 1 year—1, Wm. Field; 2, Geo. Cook.

Shorthorn male, over 1 year—1, Fred Chafe.

Shorthorn female, 6 to 12 months—1, Thos. Linegar; 2, Michael Murphy.

Shorthorn female, 1 to 2 years—1 and 2, Patrick Dunn.

Grade Shorthorn female, 1 to 2 yrs.—1, Thos. Hines.

Grade Shorthorn female, over 2 years—1 and 2, Mt. Cashel.

Best Beef Cow, any breed—1, Mount Cashel; 2, F. H. Steer; 3, P. Murphy.

Beef Steer—1 and 2, M. O'Regan.

SHEEP.

Ewe, any breed—1, Wm. J. Healy; 2, and 3, Robert Cowan.

Spring Lamb, any breed—1, Lilian Cook; 2 and 3, Henry Cook.

Ram, any breed,—1, Lilian Cook; 2, Henry Cowan.

WOOL.

Fleece, long wool—1, Robt. Cowan; 2, Wm. J. Haley; 3, Ernest Doming.

Fleece, short wool—1, Robt. Cowan; 2, W. J. Haley.

SWINE.

Large White Yorkshire Sow and litter—1, E. J. Snow.

Sow, any other breed—1, E. J. Snow; 2, Wm. Mallard; 3, Hon. G. Knowling.

Boar, black—1, J. McNeil.

Boar, white—1, Rev. J. Coady; 2, W. Field.

Berkshire Sow—1 and 2, J. McNeil.

POULTRY.

Brahma cockerel and 2 pullets—1 Jno. Reddy.

Buff Orpington cock and 2 hens—1, Heber Parsons; 2, Mrs. T. Ryan.

Buff Orpington cockerel and 2 pullets—1, Hon. G. Knowling; 2, J. Dempster.

White Orpington cock and 2 hens—1, J E. Dempster; 2, Hon. G. Knowling.

White Orpington cockerel, 2 pullets—1, Hon. W. C. Job.

Black Orpington cock and 2 hens—1, G. V. Pippy.

Black Orpington cockerel and 2 pullets—1, G. V. Pippy.

White Leghorn cock and 2 hens—1, Howard Parsons; 2, Otto Rusch.

White Leghorn, cockerel and 2 pullets—1 and 2, Howard Parsons.

Brown Leghorn, cock and 2 hens—1, Stephen Emberley.

Barred Plymouth Rock, cock and 2 hens,—1 and 2, Wm. Barker.

Barred Plymouth Rock, cockerel and 2 pullets—1, Wm. Barker; 2, Hector McNeil.

White - Plymouth Rock, cock and 2 hens—1, Walter Reid.

White Plymouth Rock, cockerel and 2 pullets—1 and 2, Walter Reid.

White Wyandotte, cock and 2 hens—1, Heber Parsons; 2, Wm. Duncan.

White Wyandotte, cockerel and 2 pullets—1, Heber Parsons; 2, William Duncan.

A. O. V. Wyandotte, cock and 2 hens—1, F. White; 2, Pierce Johnson.

Common cock and 2 hens—1 and 2, Wm Tessier.

Minorca, cock and 2 hens—1, Pierce Johnson; 2, W. F. Parsons.

Minorca, cockerel and 2 pullets—1, W. R. Butler; 2, P. Johnson.

Rhode Island Red, cock and 2 hens—1, Miss May Chafe; 2, Henry Cowan.

Rhode Island Red, cockerel and 2 pullets—1 and 2 Pierce Johnson.

Partridge Cochin, cock and 2 hens—1, H. W. Stone.

Cochin, China, cock and 2 hens—1, Mrs. Frank Rendell.

Mottled Anconas, cock and 2 hens—1, Rev. Fr. Coady.

Golden Seabrights—1, Wm. Ireland.

Trio Bronze Turkeys, cock and 2 hens—1, Mrs. S. O'Driscoll; 2, Miss Neville.

Trio Norfolk Turkeys, cock and 2 hens—1, Martin Walsh; 2, H. Thomas.

Cape Gander, and 2 geese—1, J. Butler.

Toulouse Gander and 2 Geese—1 Henry Cowan; 2, Peter Cowan.

Embden Gander and 2 Geese—1, J. McNeil.

(Continued on page 158.)

A Proof of the Superiority of Concrete.

One of the principal arguments in favor of Concrete is its fire-resisting qualities, as was illustrated recently at the Boys' Farm and Training School, Shawbridge, Quebec. This institution had just completed a circular concrete silo, when a fire wiped out all of their farm buildings with the exception of the concrete silo.

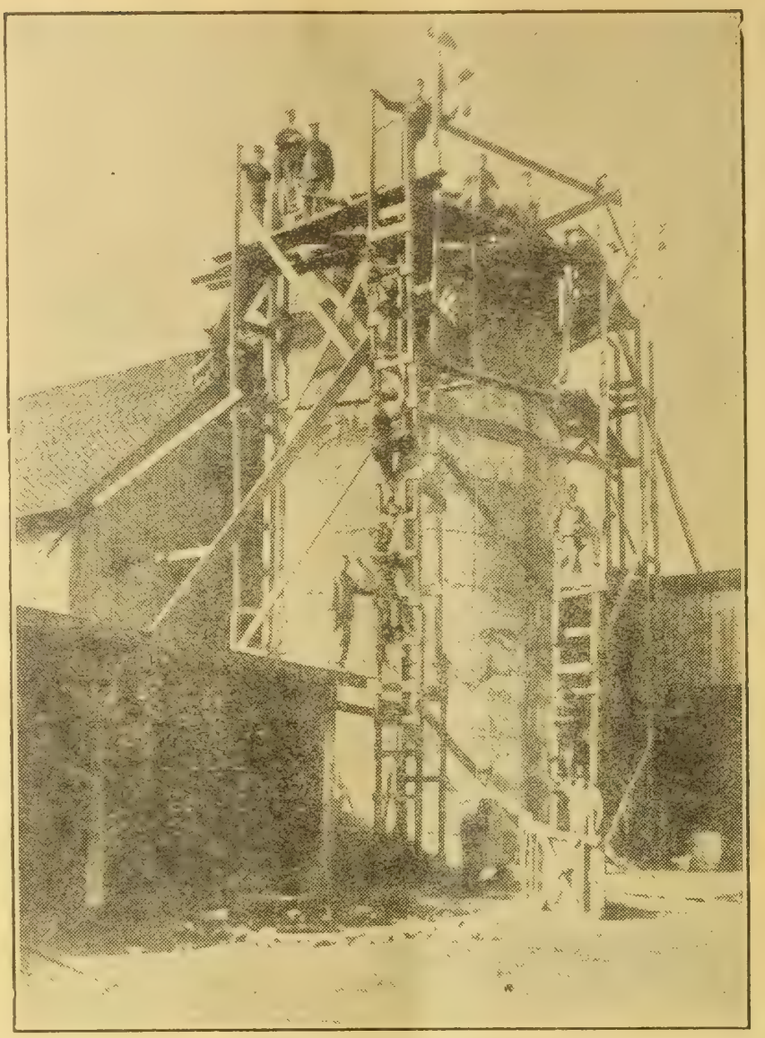
Photographs are reproduced herewith, showing the silo just before it was completed, and also showing it after the fire. Careful examination reveals the fact that this silo is today as good as when built. There were found in some places slight fire cracks, but these were only on the surface. In a few places the heat has peeled off the surface concrete to a depth of from one-fourth to one-half inch, but in no place has the damage extended beyond that. Experts aver that the strength of the concrete has not been in the least impaired, nor has it become in the slightest degree more porous. One expert gives it as his opinion that a plastering coat would make it a perfect silo in every respect.

Spectators who witnessed the fire say that the concrete walls were heated to such a degree that after the fire was extinguished the silo stood aglow against the dense background of the night and that it was visible for miles around the country.

As may be seen, by reference to the photographs, the silo stands within a few feet of what were very large buildings. These buildings furnished an abundance of excellent fuel, and in addition to these the scaffolding that had been used during the building of the silo was still in position at the time of the fire, which brought the flames closer to the silo than would ordinarily be the case.

The whole incident demonstrates, in a manner seldom equalled, the value of concrete as a fire-resisting medium.

A corroboration of these facts may be obtained from Mr. G. W. O. Matthews, Superintendent of the Boys' Farm and Training School at Shawbridge.



Before the Fire.

After the Fire.

Abnormal Appetites.

J. D. D., Annapolis Co., N. S.—I have two cows that have the habit of eating wood whenever they get a chance. They not only gnaw their stalls but tear the shingles off the barn whenever they are out.

I cannot find anything wrong with them so am writing to you to see if you know. They have been in the habit of doing this since early spring. Since spring they have been in the pasture and I am now feeding them soft food, pulped carrots, pulped turnips, tops, etc.

Ans.—The desire in cattle to chew bones, boards, leather and substances is occasionally a habit frequently caused by being fed on food lacking in some mineral element such as Calcium Phosphate. Sometimes this craving is aggravated for want of salt. It may generally be remedied by giving wheat bran, about a gallon twice a day, with from a half to an ounce of Calcium Phosphate mixed in it and placing rock salt where it can be partaken of at will. Sometimes the addition of a few pounds of crushed oats is beneficial and early cut well-cured clover is preferable to all timothy hay. J. STANDISH, V. S.

Plowman Tells About Good Plowing.

Amid the big throngs of spectators who annually attend the plowing matches, held in York and Ontario counties, is always to be seen the tall military-looking figure of Mr. Simpson Rennie, noted as an old-time champion of many a well-fought field, as an authority on questions of common and fancy plowing, and on agriculture generally, and also known as the winner of the championship of the province in competition for well-tilled, well-cultivated and well-managed farms.

For more than half a century—it was in 1864 that he defeated as strong an aggregation of plowmen as ever faced a judge—he has been known as one of the foremost authdeal of self-education in it, and of and with him it is an exact science, or very nearly so.

To enjoy a chat with him as he walks over a field where plowmen strain their eye and their judgment and their nerve over the long sod plows, and to hear him discuss the work as it is done, and how it ought to be done, is a privilege that is a pleasure.

"There are many reasons why a man should learn to plow well," said Mr. Rennie, "and not the least of them is the fact that there is a great deal of self-eduaction ib it, and of self-dicipline. To plow well, is to learn to do something well, and if it is learned early in life it goes a great way in teaching the students the habit of doing things well. The man who can plow well can handle a team well, can keep his implements just right, so as to get the most out of them. To a good plowman, a weedy or bare spot is more of an eyesore than to a poor plowman. So is a thin horse, an untidy barn or stable or piece of badly-drained land.

STRAIGHT FURROWS.

"To the novice, the great thing in good plowing appears to be to keep the furrows straight. This is a very important thing for more than looks alone. Keeping furrows straight saves time. There is no time lost in turning round in the middle of the field, finishing up an uneven land. It means that drills for turnips, mangels, potatoes, carrots and corn will be straight, that the cultivator can cut closer to them, and save labor with the hoe, and that there are fewer chances of having them torn out by cultivating teeth. It gives a tidy, tasty and attractive appearance to a field of roots. The man who can plow straight can drive his seed drill straight as well. But before all of this, it means uniform plowing, weed

cutting by the shear, and even friability in the plowed land.

SOME HINTS IN FANCY WORK.

"For the beginner, who aspires to competition in the men's open class, the first thing to do is to get the team and "plow rigged" right. This is usually better done under the supervision of an experienced teacher. It is better to start right than to learn to do anything wrong. The team should be well broken, should work well together, and step straight and true. The even, straight step of a good Clydesdale is always to be preferred to horses which swing or sway in their stride. It is always best to have the horse which is the more eager of the two on the land side.

RIGGING THE LINES.

"The best way to fix the lines for plowing is to have a line from the bit of each horse, and fixed to the lower ring of the hame on the other horse. With plow lines lopped ground the hand as it grasps the plow handles, this gives the best control of the team. With the near horse somewhat more upon the bit than the furrow horse, it is a simple matter to keep him in his place. If it is desired to have him walk a little bit closer, a little bit easier bearing on his line will allow him to step forward of the other, and this, with the inside line fixed, will bring him closer. If it is desired to hold him wider, holding back will bring him back and also cause him to walk a little bit wider. This is the best arrangement for the lines.

THE PLOW.

"It is impossible to put words to the way in which a plow should be rigged. The matter of 'cut' is one which requires the supervision of an experienced hand. In a general way, however, the plow should have a moderate but not excessive amount of 'gather' or should just hug the land side the least bit. It should also have just a little bit of 'dip' or tendency to go deeper, so that a light bearing of the hands will hold it steady at its depth. Perhaps in gravelly ground a little bit more dip and gather are required than in good, clean, clay loam.

THE STRIKE OUT.

"There is a good deal to learn about the strike out or the opening furrows. This must be done just right, so as to give a good crown to ridge. When it is done right, it is impossible to guess where the crown is, so closely does it resemble all of the other furrows.

"There is a good deal to learn about getting the right kind of a strike-out, and nothing but experience and practice will enable one to do it with any degree of regularity. Usually the strike out is made in common practise in the bottom of an old furrow, but often, especially at plowing matches, it is not. When it is made on the level, the following rule will apply: Plow straight for the stakes, with the first light furrow or 'scratch.' Make this about one and one-half inches deep, holding the plow perfectly level, never depending on turning the plow over at any angle to correct any crookedness. Calculate that the next furrow, turned over to meet it, will run at a distance of 22 inches from outside edge to outside edge. These furrows should then just meet in the middle. The succeeding round should cut out a furrow about six inches broad and 4½ to 5 in. deep, as it is desired to come to the full furrow gradually, making no uneven appearance on the top of the plowed ground. The furrows turned up by this round should also exactly meet. About three rounds more should find the plow cutting its full width and depth, setting the furrows up even, with a nice comb on top.

"CUT" ON THE PLOW.

"New cultivators for the tearing up and pulverizing of the soil have been designed to take the place of the nicely set-up style of furrow made by the old sod plow, with some 'cut' on shear and coulter, and superficial critics can find more advantage in the style of cultivation which recommends throwing the furrows over any old how, than I can. These have even gone so far as to state that the plain system of cutting out the square furrow left the ground at the bottom of the furrow in better shape than the old-fashioned plow did. A little study of the matter will soon prove this not to be the case. The real difference between the two is that in the land plowed with a plow set with 'cut' on its shear and coulter, the comb is all on top of the ground, while the other half of it is on the bottom. A horse will sink farther into newly-plowed ground which had been plowed with a plain plow. There are big air spaces left in the bottom with the latter, all of which are nicely packed together by the old time crack plowman."

PLOW UNIFORM DEPTH.

"After the plowman has struck his full depth and width of furrow," remarked Mr. Rennie, "He must be careful to maintain it evenly and uniformly. The judge will be watching for that. By looking at an angle across the field he can see at a glance whether depth has been maintained evenly or not. For width he takes out his rule, measures from the top of one comb to another, and that tells him to a fraction how well width has been kept. These processes are called by old country plowmen 'reading', the land and ridges which have not been plowed with uniform depth throughout are said not to 'read' well.

"The way in which the plowman cuts his furrow to the little scratch at the end is also important. He must get his plowing done in such a manner that the plowing of the 'headland' can be done in a tasty and thorough manner. The best way to do this is to get the 'in' of the point of the plow, so that the plow will turn the full width of the furrow from the very scratch, and this makes it necessary to learn to judge just how far back of the scratch to start the point. Each furrow should be started exactly the same. The manner of making an 'out' is equally critical. The plow should never carry the full furrow breadth past the 'scratch.' This means that the plow must be lifted out gradually, not suddenly, and the point brought out of the surface just where the board will carry the full furrow to the scartch. Of course, this means that at both ins and outs there will be a little 'shavelling' of furrow carried on past the scratch, but this is an unimportant matter, and much to be preferred over the rough uneven end made by a sharp, sudden 'out' and 'in' or the bare spot caused by coming short of the scratch with the full width of the furrow.

THE FINISH.

"As one draws to the last few furrows of the land, he must be watching and calculating for a nice 'finish.' When seven or eight rounds from the last, the matter of coming to the last with furrows of even breadth should be studied out. The judge will watch how it is done, and will use his rule on probably every furrow. Then, too, the matter of coming to a nice tasty finish is important, and the plowman who would put up a winning finish, must begin to make his last furrows a little bit shallower and narrower until the last. This will give the evenest and most uniform appearance to the whole field, and the system of finish which does will, other things being equal, always win with a good judge."—Canadian Farm.

Distribution of Seed Grain and Potatoes from the Central Experimental Farm, Ottawa, 1910-11

By instruction of the Hon. Minister of Agriculture a distribution is being made this season of samples of superior sorts of grain and potatoes to Canadian farmers for the improvement of seed. The stock for distribution has been secured mainly from the Experimental Farms at Indian Head, Sask., Brandon, Man., and Ottawa, Ont. The samples consists of oats, spring wheat, barley, field peas, Indian corn, (for ensilage only) and potatoes. The quantity of oats sent in 4 lbs., and of wheat or barley 5 lbs., sufficient in each case to sow one twelfth of an acre. The samples of Indian corn, peas and potatoes weigh 3 lbs. each. A quantity of each of the following varieties has been secured for this distribution:—

Oats—Banner, Abundance, Danish Island, Wide-Wake, Thousand Dollar, Improved Ligowo—all white.

Wheat—Red varieties:— Marquis and Early Red Fife (early beardless sorts of high baking strength), Red Fife (beardless), Preston and Huron, (early bearded) White varieties:— White Fife (beardless), Bobs (early beardless.)

Barley—Six-rowed: Mensury and Manchurian (a selection from Mensury.) Two-rowed: Standwell and Invincible.

Field Peas—Arthur and G olden Vine.

Indian Corn (for ensilage).— Early sorts: Angel of Midnight, Compton's Early and Longfellow. Later varieties: Selected Leaming, Early Mastodon, and White Cap Yellow Dent.

Potatoes—Early varieties: Rochester Rose and Irish Cobbler. Medium to late varieties: Gold Coin, Carman No. 1, and Money Maker. The later varieties are, as a rule, more productive than the earlier kinds.

Only one sample can be sent to each applicant, hence if an individual receives a sample of oats he cannot also receive one of wheat, barley, peas, Indian corn or potatoes. Applications on printed cards or sheets, or lists of names from one individual, or applications for more than one sample for one household, cannot be entertained. The samples will be sent free of charge through the mail.

Applications should be addressed to the Dominion Cerealist, Experimental Farm, Ottawa, and may be sent in any time from the 1st af December to the 15th of February, after which the lists will be closed, so that the samples asked for may be sent out in good time. Applicants should mention the variety they prefer, with a second sort as an alternative. Applications will be filled in the order in which they are received, so long as the supply of seed lasts. Farmers are advised to apply early to avoid possible disappointment. Those applying for Indian Corn or potatoes should bear in mind that the corn is not usually distributed until April, and that potatoes cannot be mailed until danger from frost in transit is over. No postage is required on mail matter addressed to the Experimental Farm, Ottawa. WM. SAUNDERS,

Director of Experimental Farms.

Big Opportunity for Farmers.

It is an intersting and instructive though possibly not a particularly edifying fact, that the poultry products of this country last year, totalled only $25,000,000 as against $625,000,000 for the United States, in the same period. Such figures as these offer food for thought. Poultrying is very much underdone at the present time and unless we are going to import eggs and poultry very heavily, our output in the next five years, must increase to ten times what it is today. Even now, we are importing eggs from the United States, Russia and Germany. Sifting these figures down to their plainest meaning, we are shown that the United States on poultry products is beating us out in the ratio of about three to one per head ofpopulation.

This $625,000,000 of poultry products in the United States last year, is more than the products in a similar period, of all the farms and ranches of the whole Dominion of Canada, including the live stock, field crops and everything which was produced on the farms of Canada last year. This is according to the Hon. Sydney Fisher, who places Canadian products at $588,000,000. The poultry products of the United States, surpassed this figure by nearly 450,000,000.

To localize the comparison, it might be said, that the whole Province of Ontario did not produce in all its farm products, a toatal last year, that was within $17,000 of as much as was produced by the hens in the one single state of Missouri.

In 1892 Canada exported $1,733,242 worth of poultry products. Last year, these figures dropped to but slightly over half a million. In 1904 the Dominion exported to Great Britain, ten times the poultry and eggs that it is today.

There are two reasons for this state of affairs. In the first place the Canadian farmer fails to realize the enormous profit-making possibilities presented by the egg market; in the second place, while he knows the producer's prices are high at the present ti e, he is afraid that a greater production would cause cold-storage houses and other middlemen to cut these prices down. The farmer does not want to produce unless he is sure that he is going to get full return for his labors. He has seen production increased in other unsupplied markets, with this result and he is afraid to produce poultry and eggs in greater quantities lest the price be forced down.

It is very true that the cold-storage houses and middlemen must shoulder much of the blame for this lack of supply.

But the farmers are awkening to the fact that there is a real market for poultry products and that this market offers big profits. If they cannot get their prices through the ordinary channels of distribution, they will have to take things into their own hands, and go after the profits in another way. Many of them have done this. The plan by which they have worked, has been taught them by the Lee Manufacturing Co., Ltd., of Pembroke, Ont.

This firm, realizing the gravity of the situation, has sent its experts to Denmark, Sweden and other foreign countries and studied co-operative circles and the co-operative marketing methods in use there. Revising these plans to make them applicable to this country, they have put the methods into successful operation with their 15,000 co-workers scattered throughout the Dominion. That the lines along which they are working are right, is best attested by the success of these 15,000 poultrymen.

It looks pery much as if co-operation among farmers and team-work in marketing, were to be the ultimate solution of the Canadian poultry problem. The idea of the farmers getting together to do their marketing and taking for themselves the profits, that would otherwise go to the cold-storage houses, makes a strong appeal to common sense. We would advise those of our readers who are not already familiar with the full meaning of co-operative raising and marketing, to get in touch with the Lee Manufacturing Co., so that each can start a co-operative circle in his own district.

THE MARITMIE FARMER

And Co-operative Dairyman.

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association The Nova Scotia and P. E. Island Fruit Growers' Associations The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers Association, and The New Brunswick Poultry Association.

Subscription Price $1.00 per year. **When paid in advance 80 cts.** Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for dis. continuance is given.

The date after your name on the little green label on front Page is, in every case, the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser be said :—**"I saw" your adv. in the MARITIME FARMER.**

WRITE YOUR EXPERIENCES.

You have undoubtedly been planning and working for a bountiful harvest this year. Some of these plans have given grand results, others have not come up to your expectations, you will therefore in a short time be able to give valuable information to your fellowmen, in regard to the best yielding results. Your interests in the welfare of the agricultural interests of the Maritime Provinces, will, we hope lead you to report to us the most satisfactory courses pursued in your various farming operations. We will be pleased to publish them in the FARMER.

Do not say to yourself, "I cannot write matter for the press." You can. Just send us the ideas in letter form if you do not care to write an article in press form and we will be pleased to revise it for you. Let us hear from you, friend. An exchange of ideas in the columns of the FARMER is bound to be of lasting benefit to the reading farmers of the Maritime Provinces, and ultimately bring to pass a regular agricultural melenium.

THE FARM.

The time is at hand when the farmer must hold up his head and be a man among men. He cannot afford to be anything else. As long as the farmer allows himself to think that he is merely a "tiller of the soil" and therefore of no special account, just so long will his friends in town treat him as an underling. But he must "back up the crow," as Josh Billings said of the cock. If men demand respect from their fellows they must have respect for themselves, and conduct themselves in a dignified manner to command respect. There is no reason in the wide world why the farmer should not be a gentleman. A calling does not make a man, but a man makes his calling. The farmer who considers himself a gentleman will have due regard for his personal appearance, and will always appear properly and appropriately dressed. He will be always neat and clean. He will educate himself so he can mix with men of other callings and talk with them on public questions on terms of equality. The weekly MARITIME FARMER hopes that the day is not far distant when each reader of this paper who is engaged in agriculture may find people speaking naturally of him as "a farmer and a gentleman." A distinguished scholar and farmer is quoted as having paid this eloquent and on the whole just tribute : "Farming is a profession requiring more shrewdness than law, more technical training than medicine, more uprightness than theology, more brains and resourcefulness than pedagogy. It is his own reward, God made farmers. The other professions are merely manmade." This is rather hard on other professions, but still none too much honor can be paid the conqueror of the soil.

WOMEN'S INSTITUTES.

The rapid growth of Women's institutes in Ontario is one of the striking features of our agricultural development. The United States, popularly termed the land of Women's clubs, can boast no such organization for the Farmer's wife.

The field of work in these institutes is almost unlimited in its scope, most of its work bearing directly upon the daily life of the home keeper. It gives to each and everyone an opportunity to enter into discussion and seek suggestions for the improvement of that most backward of all industries—housekeeping. Many organizations have branched beyond their own domestic problems and have taken up matters of social and public interest.

Since the days of first settlement there have always been many neighbors, so far as nearness of residence was concerned, who had scarcely a speaking acquaintance with each other, prejudices and existing jealousies existed which seemed a total barrier to good, neighborly feeling. The Women's Institute has tended to break down these barriers and bring all sects and classes together on a common ground.

The history of there organizations is comparatively short. In 1900 there was 33 institutes with a membership of 1,600 in the Province of Ontario, now the membership extends up in the hundreds of thousands.

The lofty object of the organization is well expressed in its motto, "for home and country." It is not the occasion of suffragette and women's rights harangues as some of the prejudiced ones proclaim, but is intended to better qualify the hand which rocks the cradel to guide the world.

IT PAYS TO READ.

Some farmers and they are not a few, will declare that they do not get any time to read. If asked to subscribe for an agricultual paper they will say that they do not get time to read, and if they had papers they would not look at them from one week's end to the other.

The chances are that these same men spend their winter evenings at the country store or post-office talking about their neighbors, and the stormy days in the blacksmith's shop, or some other like gathering place, and talk about hard times and how farming does not pay. Approach them at such times with a paper and their excuse is that they cannot afford the price of a paper, much less an agricultural paper, and then they will go on and talk about the high ideas of newspaper writers, and finally conclude that they are a hoax, and that the ideas set forth in papers are beyond the reach of common farmers. Then they go home to puruse the old methods adopted by their fathers fifty or seventy-five years ago, and to complain of hard times.

Such men, although good citizens and honest men, are scarcely worthy the name of farmer at the present time. The up-to-date farmer who succeeds must keep posted in methods, and in order to do so he must read.

Therefore, I say, to farmers read more, think more, work less, spend less time gossiping with your neighbors about matters not connected with agriculturel or farming. Talk and discuss matters, but let them be mainly matters pertaining to your business, and get the foundation for thoughts and the texts from discussions from good, reliable papers and books, and then apply the methods in practical tests and see if you are not only more successful in financial matters, but also more happy and contented on the farm. The young people certainly will be. One of the best methods for keeping them on the farm is to supply plenty of good reading, giving them a little time to read and enconraging them to stay at home, and do so yourself as far as possible.

Work less, read more, think more and gain more happiness, contentment and wealth.

CARE OF FARM IMPLEMENTS.

One of the most serious lacks on the farm is in the poor care taken of farm implements when not in use. As soon as the season is over, binders and other machinery, no longer needed this year, should be carefully cleaned ; the grease and dirt should be removed from the bearings, and these should be carefully oiled and all bright parts greased, to prevent rusting. Preparations should be made for replacing any broken or defective parts.

If time does not permit of all this, make a memorandom to be governed by on some stormy day, and then see that everything is put in readiness for the next harvesting or haying season. Get the repairs and place them on the machines at once. Take care of the plows. Get them under cover. Clean and grease the bright parts, so that, when wanted next spring, they will scour and save the time so many farmers lose in putting their implements into working order.

KEEP RECORDS.

Do you keep a record of all the work you do on the farm in order to produce certain crops ? Do you keep a record of the value received from such crops ? If not you are working in the dark.

The successful business man keeps an accurate account of all his transactions, consequently he knows which are paying lines and which are not. He can then form his plans to discard the non-paying lines and improve on the paying ones.

In the same way the progressive farmer knows, by keeping accurate accounts which operations to follow with a profit, and which to avoid.

If you have not already started a system of book keeping on the farm, begin now!

Keep an account of each and every operation around the farm, as well as of results. It matters not how crude the system may be at first, you will improve it from time to time.

GROW YOUR OWN FEED.

The wise cattle feeder will grow upon his own land the largest possible amount of food that he is to feed. He will grow as much of the nitrogenous feeds, the clover, peas, etc., as possible, but the corn plant or roots will be his main stay for succulent winter food. Under favorable circumstances he may grow enough to carry his stock advantageously through the winter, but for the most part the home grown foods must be supplemented from the market. To do this most economically the man who has sufficient hay and silage for his animals will usually need to lay special stress on the protein content of the feeding stuffs that he is to buy. While protein is not the sole measure of a food material, for his purpose he can consider it as such, for he goes to the market not to buy sugar and starch but to obtain the nitrogenous materials needed to bal ance his ration. Hence he will have little use for low grade oat feeds, he will buy bran chiefly because it will furnish needed manurial matter, and he will buy more largely of the gluten, the oil meal, distiller's grains and other materials high in protein. Which of these that he purchases will be largely determined by the market price. Under ordinary conditions he will probably find cotton seed meal to be the cheapest source of digestible protein, particularly when its high manurial value is taken into account.

Maintaining the Prestige of National Live Stock Records.

A case of importance to stock breeders all over Canada has recently come before the courts in Alberta. Mr. S. R. English, of Lanuke, Alberta, was charged and found guility af falsifying a pedigree or pedigrees contrary to the provisions of Section 14, of the Dominion Live Stock Pedigree Act, in the police court at Strathcona, Alberta. A fine of $100.00 and costs, which will run up to probably $300.00 was imposed. The evidence disclosed that in May, 1908, the accused brought from the Winter Fair at Calgary, 3 of his young Shorthorn bulls, which he had not disposed of there, sold one at Vegreville, on his return and turned the other two out on his range with his stock bull and his pure bred females. During the period that these young bulls were said to have run with the herd some 7 or 8 pure bred cows were served, conceived and subsequently had calves which were registered on application of the accused. All were registered as the progeny of his chief stock bull "Cracker." The accused denied this in part and said that only one of the young bulls had run out and that he had only registered the calves where he had seen "Cracker" serve the dam and where there was any doubt about the service he had not recorded the calves. The Court, however, preferred the statements of the witnesses for the prosecution and held that such careless methods had been adopted by English that it was impossible for him to say with the requisite certainty what the breeding of these calves was and in the face of this impossibility having made a declaration that they were all sired by "Cracker" constituted an offence under the Act.

Peter White, Esq., K. C., of Pembroke, Ont., was present at the trial on behalf of the Dominion Shorthorn Breeders' Association.

We understand Mr. English has appealed.

Securing the West Indian Market for Maritime Pure Bred Stock.

Editor Maritime Farmer:—

The months of June, July and August, I spent in the different West India Islands looking into the possibilities of development of a live stock trade between Canada and these Islands.

At the present time breeding animals are being purchased in the United States. This is owing to several causes.

First: As they have been accustomed for many years of purchasing the needed animals in that country, and have business connections that enable them to secure the same. The prices that they pay are double or trible what the same animals can be bought for in these Maritime Provinces.

Secondly: The freight rates on horses and cattle were less than half of the rate charged from Halifax or St. John.

On my return I took this matter up with Messrs. Pickford and Black; and after discussing the question in all its bearing they decided to give practically the same rate as that charged from New York.

Thirdly: They claim that the accommodations for live stock on the ships sailing out of Halifax were not equal to the ships from New York.

Personally, I do not think there is very much in this contention, however, it is expected that beginning in June next, the steamers running from Canada will be equal to if not superior to those from New York, both in passenger and freight accommodations.

Although the time spent in each of the Islands was of necessity short, and the season of the year being most unfavorable for meeting very many of those who are interested in the live stock trade, in consequence of their absence from home during the heated period, yet I was enabled to interest a large number in the live stock trade withthese provinces; particularly in Holsteins, Ayrshires, Jerseys, Guernseys, Shorthorns, Here fords, and Aberdeen Angus cattle, Southdown, Oxford Down, and Shropshire sheep, Berkshire hogs, Plymouth Rock fowls, and Bronze Turkeys.

In horses, with the exception of a limited number for carriage purposes. The wants are for mares of about 14 hands high and not more than 7 years old, particularly good style and action not a necessity. This class of horses is not desirable in Canada but of which we have all too many. I gave to those desiring to purchase animals of any kind the names and addresses of different breeders in the Maritime Provinces.

On every steamer since my return, shipments are going forward and if the effort that has already been put forth were persistently followed up a very large trade would be developed in the near future.

A very serious complaint against our animals and which I heard in almost every Island I visited, was that in very many instances animals sent forward were not as described, and I would wish to emphasize the necessity of sending only animals that are of such quality as will please those to whom they are sent.

With the reduced freight and insurance rates and accommodations such as the ships of the future will have, and a persistent effort to win the confidence of the people of the West India Islands, I see no reason why the prices obtaining in Ontario and Quebec should not be duplicated in these Maritime Provinces.

The difficulty each breeder now and in the past, had to contend with was that the prices that could be realized here for pure bred stock did not justify their continuance in the business. The reason for the difference in prices between these Provinces and Ontario is that they have an outside market which fixed values.

The West Indian market lies at our daor. Canadian Subsidized Steamers are making regular trips. This market should be ours and will be, if we make an effort to secure it, and will so advance prices as to make the breeding of pure bred stock a financial success.

E. B. ELDERKIN.

Amherst, N. S.

Freight Rates to the West Indies.

Amherst, N. S.,
Nov. 23, 1910.

Editor Maritime Farmer:—

Enclosed find freight rates to the West Indies. On horses and cattle this rate is just half of the rate previously obtained.

HALIFAX TO	Horses	Cattle	Sheep	Swine	Poultry
Bermuda	$25.00	$20.00			10c per c.f.
St Kitts, Antigua, Dominica, St Lucia, St Vincent	25.00	20 00	1.75	1.75	12c " "
Barbadoes	20.00	15.00	1.75	1.75	9c " "
Demarara	25.00	15.00	1.75	1.75	12c " "
Trinidade	20.00	15.00	1 75	1.75	9c " "
Jamaica	25.00	25.00	1.75	1.75	12c " "

Cattle under 1 year ½ of the above rate.

On poultry there is 10 p. c. primage; freight to Antigua, Montserrat, Dominica, St. Lucia and St. Vincent must be prepaid otherwise an additional 5 p. c. will be charged.

Messrs. Willis and Pryor, Hollis St., Halifax, have agreed to a rate of insurnce very much less than charged by other companies as far as I know. Their certificate covers all risks with the walking ashore clause, which means if an animal is able to walk ashore on arrival at its destination there is no claim on the insurance company, otherwise the full amount will be paid.

I know that this information will be of great interest to many of your readers, so take the liberty of enclosing it and asking for space for same in your valuable paper.

E. B. Elderkin.

For a Traction Ditcher.

The following copy of a petition which is being signed by many of the most prominent farmers throughout the province of New Brunswick has been sent us by Mr. S. B. Hatheway, president of the New Brunswick Farmers' and Dairymens Association. Drainage is a live question with all the progressive farmers in the Maritime Provinces and each and every farmer should drop a post card to Mr. S. B. Hatheway, Fredericton, N. B., and ask him to affix their names to the petition. In numbers there is strength.

PETITION.

TO HIS HONOR THE LIEUTENANT GOVERNOR IN COUNCIL.

"May it Please Your Honor:—

"Your petitioners having observed "the success which has attended the "introduction of ditching machinery "in parts of the Province of Ontario "by the Government of that Prov-"ince, and this year having noticed "the move made by the Nova Scotia "Government to encourage the drain-"age of land by the introduction of "a modern power ditcher, we would "ask that the Department of Agri-"culture look fully into this matter "and procure for the benefit of the "farmers of this province an outfit "which will illustrate the most "economical method of draining "land. We understand that the Nova "Scotia Government has placed their "plant in operation at Shubenacadie "and other points and has a large "number of orders from land owners "at a rate of 21 cents per rod for a "three foot ditch, this price being "estimated to pay cost of operation "and interest on investment.

"Your Petitioners would be willing "to guarantee this price, or such ad-"vance upon this price actually ne-"cessary to make the venture meet "expenses, not to exceed 31 cents per rod, for the number or rods of ditch "placed beside our respective names "below.

"And your Petitioners as in duty "bound will ever pray.

Tile.

Editor Maritime Farmer:—

In last issue of the Maritime Farmer you call for suggestions as to what is the most important considerations in introducing successful alfalfa growing in the Maritime Provinces. It seems to me that the word "Tile" answers this problem. Before alfalfa or any other crop will yield their best on the greater percentage of our farms we must underdrain.

S. B. HATHEWAY.

Fredericton, N. B.

Cup for the Agricultural College Students at Truro.

The Hon. G. H. Murray, Premier of Nova Scotia, has presented a handsome Cup to be awarded to the student in attendance at the Agricultural College who attains the highest degree of proficiency in the judging of Cattle, Sheep, Hogs and Horses. Mr. Murray presented a similar cup last year, which was won by Mr. E. S. Leonard, of Paradise, Annapolis Co., with Mr. W. L. McFarlane, of Fox Harbor, Cumberland Co., as a close "runner up." The winner of last year's cup, as well as Mr. McFarlane, are in attendance at the College this year, but the former will be debarred from again contesting. There is much rivalry among the students in this competition, which will serve the purpose of arousing a greater interest, if possible, in live stock work. The students highly appreciate Mr. Murray's gift, and will, undoubtedly, by their efforts, show their appreciation of the interest which he has always manifested in their progress, more especially in attaining a knowledge of live stock.

Ice Necessary on the Farm.

Before winter sets in, some sort of building should have been prepared for the storage of ice for use during the coming year.

Every farmer in whose vicinity ice is available should store a sufficient quantity for use during the summer months. A supply of ice is worth all it costs, if properly applied in the preservation of milk, butter, meat, vegetables and other perishable articles. The dairy farmer especially will find in a supply of ice great saving of labor and a positive safeguard in keeping his milk during hot weather. The crudest kind of building, which will keep out the sun and the rain, or the corner of a shed will serve for the mere storage of ice if dry sawdust or marsh hay is available in which to pack it for protection against the heat. All that is necessary to do is to provide for some drainage and cover the ice on all sides, top and bottom, with about 12 inches of sawdust, or 24 inches of hay or cut straw, and protect the covering from the weather.

Patrons of cheese factories or creameries, who wish to keep Saturday evening's or even Sunday morning's milk until Monday morning during the hottest weather, will find a supply of ice indispensible, as well as useful on other nights of the week if the milk is to be delivered to the factory in proper condition. Proper condition implies not only that the milk must be sweet enough to be accepted, but that it shall not have passed the stage of "ripeness," which permits of a first c,ass quality of product being made from it. Milk which is too "old" or too far advanced towards the stage when it is known as "sour" will make neither a fine quality of butter or cheese, nor a maxium amount of it. An enormous loss results to the patrons of factories every year in both directions. The amount of waste which occurs from the handling of overripe milk at cheese factories would be astonishing if it could be accurately measured or were more generally known. This waste may be prevented by a proper cooling of the milk at the farms. A supply of ice will facilitate the work and insure successful handling of the milk under any conditions imposed in practical dairying.

The effectiveness of water as a cooling medium depends, as has already been stated, on the manner in which it is utilized. A very common plan is to place the can containing the milk in a tub or tank of water so that water surrounds the lower part of the can. A few figures will demonstrate the measure of efficiency which this plan affords.

Suppose there are 100 lbs. (10 gallons) of milk to be cooled and the temperature directly after milking, allowing for some air cooling, is 90 degrees. If this milk is placed in a tank containing an equal quantity of water at 56 degrees, the result, theoretically, would be to reduce the

(Continued on page 157.)

HORTICULTURE

Best Fertilizers for Orchards.

The Massachusetts station at Amherst has been experimenting for 20 years with fertilizers for the apple orchard. Various combinations have been used, such as stable manure, wood ashes, bone meal and muriate of potash, bone meal and low-grade sulphate of potash. Recently Director Brooks of the station calls attention to the fine results from an application of bone meal and low-grade sulphate of potash, applied at the rate of 600 pounds of the former to 400pounds of the latter. He says the trees are much larger and produce much more fruit.

Another plat which received the same amount of bone meal combined with 200 pounds muriate of potash did not do as well; this in spite of the fact that both plots received approximately the same amount of actual potash. The low-grade sulphate of patash, however, contains a large amount of magnesia. Muriate does not supply this element. Prof. Brooks feels that magnesia is an essential element of plant food, and is, perhaps, what accounts for the better returns. On the other hand it is an element which ordinarily appears to be supplied in sufficient quantities from natural resources.

The experiment as a whole shows decisively that apple trees must be fed to grow and bear well. A cneck plot where no fertilizer was used has given inferior results through the entire period of experiments. As a whole, the fertilizers have cost about $12 to the acre, except in the case of stable manure, which is a,varying price, owing to different farm conditions. Prof. Brooks says no one familiar with the situation will believe for a moment that any one selection of materials can always be best. The combination of bone meal with low-grade sulphate of potash in this experiment has produced satisfactory results. It seems likely that in many cases similar results would be obtained. On soils naturally deficient in lime, basic slag meal might easily be used in place of the whole or part of the bone."

Three fertilizer farmulas are recommended by Prof. Brooks following this 20-year experiment. No. 1 is 600 to 800 pounds bone meal, and 350 to 400 pounds low-grade sulphate of potash. This is likely to prove most valuable on the lighter orchard soils. It supplies a little nitrogen in which such soils are often deficient and which they have little capacity to hold. If these soils are deficient in lime, as is likely to be the case, an application at the rate of 1500 to 2000 pounds per acre before the trees are set, and a further application at the rate of 600 to 800 pounds per acre once in five or six years will prove helpful. Under this system clover will become abundant in the orchard kept in sod, where such cover crops as soy beans, vetches or clovers will thrive if tillage is practiced Under either the soil or tillage system, therefore a sufficient supply of nitrogen will be brought within the reach of the trees.

The second formula recommended is 800 to 1000 pounds basic slag meal, and 350 to 400 pounds low-grade sulphate of potash. This will prove well suited for use on the medium or heavy soils. It supplies no nitrogen, but creates soil conditions peculiarly favorable for the coming in of clover in the sod or nitrogen-gathering cover crops in tilled orchards.... If the growth of the trees is not satisfactory a small amount of nitrate of soda, 100 to 125 pounds, may be added.

The third formula is 600 to 800 pounds basic slag meal and 300 to 350 pounds low-grade sulphate of potash. This differs from No. 2 in supplying slag and potash in smaller amounts. The formula is suggested for use in those cases where it is convenient and regarded as desirable to employ some stable manure in the orchard. Prof. Brooks does not believe it will usually pay to purchase stable manure for orchards, but in so far as it is available as a home product its use in moderate quantities may be advisable. All fertilizers are invariably applied broadcast in the early spring.—N. E. Farmer.

Scientific Pruning.

Scientific pruning is one of the most vital factors in fruit growing in that it permits of the free circulation of light and air through the branches of trees, thus making possible the production of uniform fruit of color, size and lusciousness.

The training of the tree to produce the best quality fruit is the factor now dominant among fruit growers. Many who have not devoted time to study the methods of the tree entertain the idea that more fruit is produced by making the tree healthier through this operation. This statement, obvious to a careful student of horticulture, is erroneous. It is consistent to say that a tree grows as nature intended it should, and it is an encroachment to alter its growth in narrowing it into a channel unproposed by nature.

The prime object of pruning are to allow circulation of light and air through the branches. It should not be merely a custom. Just because one man who has had success in pruning and raising good fruit prunes at a certain time should not mean that another can do likewise. Pruning is a phase of fruit growing in which reason and precision must be exercised. The apple tree must not be an object af butchering because it happens that it needs pruning and because of superfluaus branches. In the first pruning a grower should exercise the greatest care. The head and the members of shoots with which to start the career of the tree are factors requiring study an attention.

Sunlight should reach every twig. The sap should flow to every leaf proportionately. This is what assists in the larger production of a luscious fruit with quality that will find a ready market.

With a tree that has many branches close together it will be observed that the fruit may be large, but is lacking in both essentials, color and lusciousness. In this case the superfluous limbs should be cut away in such a manner as to allow sunlight to pass down the tree and spread impartially through it.

Careful study of local conditions has disclosed the fact that every grower must not do as his neighbor has done in recent years or what he intends to do; but he must understand that it is essential to devote his attention to the many peculiarities existing in his own orchard. Each variety of fruit as well as the peculiarities of the variety must receive attention. No two trees can be or should be pruned alike.

Blackberry Culture

The following appeared in a recent issue of the Maine Farmer in reply to an inquiry for information re the culture of blackberries and how to reclaim an old piece which has been neglected a number of years.

"If the old piece was ours we should start by cutting out a large proportion of the plants so as to make rows of them. The distance between the rows may depend largely upon the manner and method of cultivation—that is the working of the soil, is very desirable and necessary. If one is to use machinery and a horse or horses in cultivating, the rows should be set six to eight feet apart, according to the best growers. This gives opportunity for frequent and thorough cultivation, but late fall cultivatian is not recommended. If one intends to cultivate the patch by hand the rows may be left nearer together. We should not do any pruning this fall, except perhaps to cut off a branch which has grown so as to be in the way. Of course the plants in this old and neglected patch have grown very long and are inclined to droop, but if you want to get the most berries possible next season while carrying on the process of reclamation they would best be left, for the plants have not thrown out the laterals as they would if pruned at the proper time, and of course it is now too late to effect any change in that direction this season. We would give the berry patch a liberal coating of good barnyard or stable maure late in the fall, and that would be about all the attention we should give it until next spring. The cutting into rows is not necessarily fall work, but the fall is the most convenient season to give the time that will undoubtedly be required for that surgical treatment of this patch.

"Next spring the real work on the berry patch should be commenced in good earnest. There should be frequent cultivation to prevent the cut out plants from growing up again between the rows and also for the general benefit of the crop. The pruning of the patch, and the same can be said of a new patch, should commence as soon as the new shoots are up the height of three or four feet, or whatever height the individual grower desires. Three feet seems to be the best height, for if pruned there the result will be a low, stocky plant which will be strong and easily within reach of the pickers.

The end of the shoot should be pinched off or clipped off, which will cause laterals to grow. These in turn should be pinched or clipped off when a foot and a half or two feet long. If this is done a strong and well formed bushy plant of medium height will be the result. The cultivation should be continued through the summer but not late into the fall. The rows should be kept clean and the pruning should be kept up at frequent intervals through the summer to prevent the plants from growing too high and spreading too much. Then in succeeding years the old plants should be cut out every spring and a certain amount of new plants should be allowed to grow, just as many new plants as the grounds can well support. These will have berries the

LEARN TELEGRAPHY THIS WINTER.

Hundreds of new "Telegraph-Stations" are to be opened on the Grand Trunk Pacific next summer. Young men are going out from this School to positions with salaries from $50 00 to $75 00 per month. WHY NOT YOU? Enter any time. Write today for Free Catalogue explaining full particulars. Address :

Had Severe Pains In Back.

Felt As If It Must Break.

Mr. Alfred E. Davis, Gorrie, Ont., writes:—"For some years I suffered from severe pains in my back, and could hardly work at all, and when I stooped down to pick up anything felt as if my back must break. I was advised to try Doan's Kidney Pills and after taking two boxes was entirely cured, and I feel that I cannot speak too highly in their favor.

"This was nearly four years ago and I still remain cured."

For Backache, Lame Back, Weak Back, there is no remedy equal to Doan's Kidney Pills for taking out the stitches, twitches and twinges, limbering up the stiff back and giving perfect comfort.

Doan's Kidney Pills are 50 cents per box or 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

In ordering direct specify "Doan's."

second year, for the fruit of the blackberry is borne on wood of the previous year's growth.

"If this method is followed it should produce large berries of good quality if the plants are of a good variety to start with. Like all other crops there is benefit in breaking up the ground after a few years, and putting in a different crop or setting out new stock. The replacing of occasional or alternating rows with new plants secured from some other good field is also likely to be of benefit to the crop. The blackberry is a luxuriant grower and there is not much danger of giving it too much pruning."

Regulations Governing Importations of Nursery Stock.

The attention of all persons who intend to import nursery stock into Canada is called to the regulations of "The Destructive Insect and Pest Act" which have already been published in these columns; they can be obtained on application to the Department of Agriculture, Ottawa.

In particular they should note the following regulations governing the conditions under which nursery stock may be admitted:—

"5. All persons importing nursery stock into Canada shall give notice to the Minister of Agriculture within five days of despatching the order for the same, and they shall again notify the Minister on the arrival of the shipment in Canada."

"Notice shall also be given to the Minister by all transportation companies, Custom House brokers and other persons importing or bringing nursery stock into Canada, immediately such a consignment is received by them. Such notice shall include the name of the consignor and the cobsignee, the points of origin and d?stination, the name of the company carrying the nursery stock, as well as the nature, quantity and origin of the same."

"6. European nursery stock, and such other imported vegetation or vegetable matter as the Minister may determine, entering Canada may be allowed to proceed and shall be inspected at the point of destination butmust not be unpacked except in the presence of an inspector."

Feeding Value of Apple Pomace.

Investigation has proved that the by-product of the cider mills has real merit as a ration for stock. Herewith is abstract of a letter written bt a Connecticut subscriber dwelling on this subject. The figures are furnished by Pro. E. A. Jenkins of the Connecticut Experimental station to whom a sample of pomace had been submitted.

"Your sample of pomace is rather below the average in protein and high in extract. But as it is, you see it compares favorably with the three other feeds named in content of feeding material. Of course these analyses show nothing of the digestibility. I know of no experiment on that subject. I do know that animals made from it very readily and with apparently good results. J. H. Dickerman of Mt. Carmel used to feed it to young horses, and said it kept their coats sleek and kept them in good condition. Of course, the feeders are the ones to judge of its value but on general principles, I should certainly think that $1 a ton was very cheap for it.

	Pomace	Silage	Potatoes	Turnips
Water	74.54	79.10	78.89	90.46
Ash	0.73	1.38	0.95	0.80

Get the light draft "Bissell"

Don't make your horses wear out their energy dragging one of those common hard-running land rollers. Hitch them to the light draft "Bissell." The "Bissell" runs easier than other land rollers, because it has large ½ in. roller bearings instead of the usual 3-8 in. diameter. And because the bearings are encased in solid, one-piece malleable cages, whereas ordinary cages are of pieces rivetted together. Our solid cages keep the bearings straight in line, whereas rivetted cages soon twist out of shape and allow the bearings to grind, causing heavy draft. And because the heavy 2 inch solid steel axle revolves with the drums the "Bissell" is so nearly frictionless that oiling is scarcely ever necessary. The "Bissell" is staunchly built. It is the only roller with steel plate bottom in the frame. Compare the "Bissell" with any other roller, especially at work in the field, and you'll quickly decide to buy the "Bissell." Send to Dept. M. for booklet containing full description of the 6, 8, 9, 12 ft. lengths. We also make a Grass Seeder Attachment for use with the "Bissell."

And don't believe any roller is the "Bissell" unless the name "Bissell" is stamped on it. We tell you that for your protection.

Ayrshire Records of Milk and Fat.

The following Ayrshire cows have lately registered in the Canadian Record of Performance Test.

MATURE CLASS.

"Highland Lass"—12013—Bred and and owned by Alex. Hume, Menie, Ont. Nine years of age at commencement of test. From June 7th 1908 in 358 days she gave 8622 lbs. of milk and 356.87 lbs. of fat. Average per cent of fat 4.13.

"Nellie Gray of Hickory Hill"—15332—Bred and owned by N. Dyment, Clappison, Ont. Seven yers old at commencement of test. From March 11th, 1909, in 355 days she gave 12040.2 lbs. af milk and 469.2 lbs. of fat. Average per cent. of fat 3.90.

"Maggie of Culcraigrie"—14338—Bred by Wm. Stroyan, Twnyholm, Scotland. Owned by Experimental Farm, Ottawa, Ont. Eleven years old at commencement of test. From May 3rd, 1909 in 314 days she gave 8620 lbs. of milk and 321.16 lbs. fat. Average per cent. of fat 3.75.

FOUR YEAR OLD CLASS.

"Glenshamrock Canty Again" —24826—Bred by Jas. Kennedy, Auchinlock, Scotland, owned by A. Hume & Co., Menie, Ont. Age at commencement of test 4 years and 10 days. From March 1st, 1909 in 344 days she gave 7531.75 lbs. of milk and 310.62 lbs. of fat. Average per cent. af fat 4.11.

THREE YEAR OLD CLASS.

"Forget-Me-Not of Hickory Hill"—27661—Bred and owned by N. Dyment, Clappison, Ont. Three years and 113 days old at commencement of test. From December 9th, 1908 in 365 days she gave 7578.5 lbs. of milk and 309.05 lbs. of fat. Average per cent. of fat 4.08.

"Denty 4th of Ottawa"—25269—Bred and owned by the Central Experimental Farm, Ottawa, Ont. Age at commencement of test 3 years and 5 days. From April 6th, 1909 she gave 6942.5 lbs. of milk and 312.20 lbs. fat. Average per cent. of fat 4.50.

TWO YEAR OLD CLASS.

"Beauty of Hickory Hill"—27663—Bred by J. B. Poole, Dundas, Ont. Owned by N. Dyment, Clappisson, Ont. Age at commencement of test two years and ninety days. From From Nov. 1st, 1908 in 358 days she gave 7597.75 lbs. of milk, and 281.54 lbs. af fat. Average per cent of fat 3.70.

"Bonny"—24357—Bred by James Clark, Campbellford, Ont. Owned by Jas. Begg, St. Thomas, Ont. Age at commencement of test 2 years and 43 days. From March 23rd in 365 days she gave 7288 lbs. of milk, and 322.79 lbs. of fat. Average per cent. of fat 4.43.

"Lady Betty"—23604—Bred and owned by Ja...es Begg, St. Thomas, Ont. Age at commencement of test 2 years and 170 days. From March 8th in 365 days she gave 7182 lbs. of milk and 302.71 lbs. of fat. Average per cent. of fat 4.21. ...

"Prima Donna"—24434—Bred by Alex. Hume & Co., Menie, Ontario. Owned by Frank H. Harris, Mt. Elgin, Ont. Age at commencement of test 2 years and 228 days. From April 1st, 1909 in 344 days she gave 7191.7 lbs. milk and 284.67 lbs. of fat. Average per cent of fat 3.96.

"Clara of Hillview"—24460— Bred by A. Kennedy & Son, Vernon, Ont. Owned by W. L. Centre, Innisfail, Alta. Age at commencement of test 2 years and 290 days. From June 1st, 1909 in 365 days she gave 6844.5 lbs. of milk and 275.36 lbs. of fat. Average per cent. of fat 4.02.

"Prim of the Willows"—26879—Bred by Dawes & Co., Lachine, Que. Owned by P. D. McArthur, North Georgetown, Que. Age at commencement of test 2 years and 63 days. From June 20th, 1909 in 357 days she gave 6104.5 and 237.34 lbs. of fat. Average per cent of fat 3.88.

"Laura Belle"—27772—Bred by Wm. Rannie, Menie, Ont. Owned by W. L. Center, Innisfail, Alta. Age at at commencement of test 2 years and 80 days. From July 1st, 1909 in 365 days she gave 60001.5 lbs. of milk and 238.77 lbs. of fat. Average per. cens. of fat 3.98.

"Southwick Kirsty 8th"—28538, bred by Sir Mark J. McT Stewart, Southwick, Dumfries, Scotland. Owned by George Hay, Howick, Que. Age at commencem?nt of test 2 years and 65 days. From June 15th, 1909 in 365 days she gave 5833.5 lbs. af milk and 229.0025 lbs. fat. Average per cent of fat 3.92.

"Southwick Lilly 5th"—28539 — Bred by Sir Mark J. McT. Stewart, Southwick, Dumfries, Scotland. Owned by Geo. Hay, Howick, Que. Age at commencement of test 2 years and 60 days. From June 15th, 1909 in 365 days she gave 5662.25 lbs. of milk and 248.34 lbs. of fat. Average per cent of fat 4.38.

To October 1st, 1910, 104 cows and heifers have registered in this test. 34 Mature cows averaged 10755 lbs. milk and 400.17 lbs. fat, equal to 466.86 lbs. of butter per year.

8 four year old heifers averaged 9315 lbs. milk and 360 lbs. fat, equal to 420 lbs. butter per year.

18 three year old heifers averaged 8064 lbs. milk and 308 lbs. fat. Equal to 359.31 lbs butter per year.

44 two year old heifers averaged 3970 lbs. milk and 291.77 lbs. fat, equal to 340.40 lbs. butter per year.

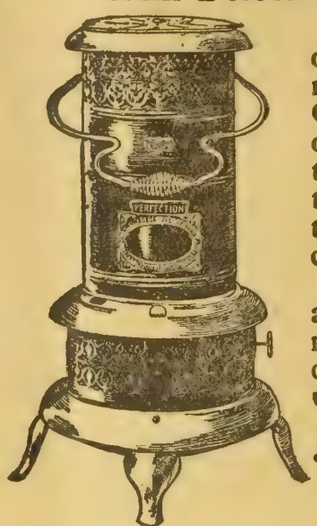
Huntingdon, Que.

Mold Prevention.

Judging from the letters we get at the college it seems to me that moldy butter really merits more attention than it receives. I believe a great many buttermakers have incorrect ideas as to the score of a large amount of moldy butter. If we are to prevent mouldy butter we must pay attention to the sources fro... which mold comes. me have our methods of treating the tub so as to destroy the mold spores that happen to be in the tub.

Dry Your Clothes on a Wet Washday

With a New Perfection Oil Heater



When clothes can't be hung outside, and must be dried in a room or cellar, the New Perfection Oil Heater quickly does the work of sun and air. You can hang up the wet clothes, light your Perfection Oil Heater, open the damper top, and the heat rises and quickly dries the clothes.

Do not put off washing to await a sunny day in order to avoid mildew. Dry your washing any day with hot air from a

PERFECTION SMOKELESS OIL HEATER

Absolutely smokeless and odorless

It gives just as much heat as you desire. It is safe, odorless and smokeless.

It has an automatic-locking flame spreader, which prevents the wick from being turned high enough to smoke, and is easy to remove and drop back, so the wick can be quickly cleaned. Burner body or gallery cannot become wedged, because of a new device in construction, and can always be easily unscrewed for rewicking.

An indicator shows the amount of oil in the font. Filler-cap does not need to be screwed down, but is put in like a cork in a bottle, and is attached to the font by a chain. Finished in japan or nickel, strong and durable, well-made, built for service and yet light and ornamental. It has a cool handle and a damper top.

Dealers Everywhere. If not at yours, write for descriptive circular to the nearest agency of the

The Imperial Oil Company,
Limited.

One of the incorrect ideas which many have as to the cause of moldy butter is with reference to the refrigerator. Last winter we received many letters, one creamery especially saying that the year previous they had a large amount of trouble with moldy butter but they thought it it was from their refriegerator. They took out the old refrigerator and installed a first class new one. Now, gentlemen, the refrigerator itself is not going to cause moldy butter. You may have a refrigerator that is so damp that mold will grow on the walls, but that isn't likely to cause mould on butter. Mold come from mold spores.

For instance a source of mold to which the buttermaker does not devote attention at the present time is the paper and wrappers. I am certain that the paper itself may be just as much a source of of trouble as the tub unless it is in good condition when used or treated in some way to destroy the mold.

You will know the condition that favor mold growth. One is an abundant supply of moisture. Another thing we have to have is air. The third thing is some food material. Mold will grow on practically anything, but the kind we find depends upon the material itself. On paper, instead of having a mold that is greenish in color, we have one that is black. The mold plant which we get on ordinary material is colorless and only when it produces seeds does it produce color. The plant on butter is black. There are always more or less mold spores on liners and wrappers. Whether we get into trouble with these depends on how we store that paper after it comes to us. When we store butter in a clean and dry place it can't grow, but as soon as we put the paper in a damp place so that it will gather moisture we will have trouble.

The mold we get on our butter does not grow on the butter itself. It grows very largely on paper. Butter is not a good food material for our ordinary mold, but when we bring that paper in contact with the butter the mold grows on the paper quickly and penetrates into the butter. In tubs it grows on the wood and then on the butter. When we place butter in tubs, especially in unparafined tubs, the moisture is taken up by the tub and the butter shrinks, leaving an air space which is a good place for mold to grow.

I think that the points, which I have mentioned are the most important from the standpoint of the butter maker. Where the stock is held at a low temperature—below the freezing point—of course that stops the growth of mold. When it comes to treating the paper that seems to me to be of very much less importanc. You can treat the paper in a number of ways. If you soak the paper in brine for a considerable period, possibly you would not have much troubl?. Brine is not half strong enough to kill mold spores. If we treat paper with some great agent that is strong enough we will likely prevent all trouble. Soak your paper in lime water. It is perfectly harmless. The only thing is to use perfectly fresh lime. By soaking the paper for two hours we will destroy very largely the mold spores. The great advantage in using lime is the fact that it is cheap.

Another thing which can be used, and which is stronger than lime, is hydrogen peroxide used in a 10 per cent. solution. The disadvantage there is the expense. It costs 25c per pound.

Another way which can be used is simply treating the paper in hot water. Place the package of wrappers in a pan and bring the water up to a boil. That does not injure the pa-

Up-to-Date Specialties For Farmers And Gardeners

Things you need—implements and tools that should be on every truck garden and farm. Our way of making these specialties assures adaptability, strength and service at the minimum price for the best goods of their kind on the market.

"Eureka" Root Cutter

will slice or shred from 1 to 2 bushels per minute. Fastest machine made—easiest running. Tapering cylinder—10 best steel knives.

"Eureka" Sanitary Churn

Barrel of finest stoneware—top of clear pressed glass. Churns by hand lever. The only sanitary churn made. 3 sizes—8, 10 and 12 gallons.

"True" Wagon Box and Rack

Without wings and ladder, it is a perfect wagon box. With them, it is the best Hay, Stock, Wood, Poultry, Corn or Fruit Rack ever invented. Adjusted to any position in a minute without wrench, hook or rope.

"Eureka" Combination Anvil

Best iron anvil, with vice, pipe vice and drill attachment, and saw clamps. Just what you need for repairing tools and machinery. Weighs 60 pounds.

The "Bacon" Seed Drill

will handle the most delicate seed without bruising or breaking, and will sow evenly to the last seed.

Write for Catalogue

Every farmer, who wants to make money out of his farm, ought to have our new catalogue. It shows our TOOLS, Rakes, Hees and Machines as they are, and describes their construction in detail. Write for free copy.

RHEUMATISM CURED.

Jas. McKee, Linnwood, Ont.
Lachlin McNiel, Mabou, C. B.
John A. McDonald, Arnprior, Ont.
C. B. Billing, Markham, Ont.
John Mader, Mahone Bay, N. S.
Lewis S. Butler, Butin, Nfld.

These well known gentlemen all assert that they were cured by MINARD'S LINIMENT.

Quality Butter

If you have never used a "FAVORITE" CHURN, you can't imagine what a difference it will make in the quality of the butter.

The "FAVORITE" is known all over Canada as the Churn that brings the quality butter—and gets every drop of butter out of the cream. Hand lever and foot tread—8 sizes.

"Puritan" Washer is another old favorite. Washes a tubful of clothes in five minutes. If your dealer does not handle them, write us. 74

DAVID MAXWELL & SONS, - ST. MARY'S, ONT.

per at all and puts it in a good condition to use on the butter.

I want to emphasize that the most important thing for the butter maker to do to prevent mold, is to be careful where the paper is stored.

The question is asked how are we to test paper for mold? I will say that we simply put samples of the paper in conditions that are favorable for mold growth. Put it in a pan and cover it over with another pan.

A great many creameries wrap their butter with moist paper, but butter paper that has been treated to boiling water will dry quickly.—Prof. E. G. Hastings' address before Wisconsin Buttermakers' Convention.

Milk Standards.

The standards for milk and milk products, established by the Dominion Government under the adulteration act, are announced in the issue of the "Canada Gazette."

Milk must be the unaltered product obtained by complete and uninterrupted milking and must contain at least 3.25 per cent. of milk fat and 8.5 per cent. of milk solids other than fat.

Skim milk must contain at least 8.5 per cent. of non-fat milk solids.

Pasteurized milk is that heated to a point below boiling to kill mast of the active organisms and immediately cooled to at least 45 degrees and kept at such temperature till delivered to the consumer, at which time it shall not contain more than 10,000 bacteria per cubic centimeter.

Sterilized milk must be heated to boiling point to kill all organisms and shall be offered for sale only in hermetically closed containers bearing the words: "This milk should be used within twelve hours after opening the container."

Certified milk should be taken from cows semi-annually subjected to the tuberculin test, and found without reaction. It shall contain not more than 10,000 bacteria per cubic centimeter from June to September and not more than 5,000 bacteria from October to May inclusive. It shall be free from disease producing organisms, disagreeable odor or taste. It shall have undergone no pasteurization or sterilization, and be free from chemical preservatives. It should be cooled to 45 degrees F. within half an hour after milking, and kept at that temperature until delivered to the consumer, and shall contain 12 to 13 per cent. of milk solids, of which at least 3.5 per cent. is fat. It shall be from a farm whose herd is inspected monthly by the veterinarian and whose employees are examined monthly by a physician.

Cream, unless otherwise specified, must contain not less than 18 per cent. of butter fat, must contain no preservatives and must be free from gelatine or other substances added with a view to giving density or apparent thickness.

Butter must contain not less than 82 5-10 per cent of milk fat and not more than 15 per cent. of water.

The greatest danger from influenza is of its resulting in pneumonia. This can be obviated by using Chamberlain's Cough Remedy, as it not only cures influenza, but counteracts any tendency of the disease towards pneumonia. Sold by all dealers.

How to Extract a Splinter.—Here is something worth knowing. When a splinter has been driven deep into the hand it can be extracted without pain by steam. Nearly fill a wide-mouthed bottle with hot water, and place the injured part over the mouth of the bottle and press tightly. The suction will draw the flesh down and in a minute or two the steam will extricate the splinter and inflammation together.

People are Talking What and Why.

UP IN ONTARIO THE FARMERS ARE TALKING OF THE GREATEST DOLLAR'S WORTH OF FARM READING THEY EVER GOT IN A WEEKLY FARM PERIODICAL. THEY ARE TALKING OF FARM AND DAIRY, AND WELL THEY MIGHT! IT IS THE SAME STORY WHEREVER FARM AND DAIRY GOES.

Have you heard of the great improvements that have been made in Farm and Dairy? Each and every week of the year, Farm and Dairy goes to its subscribers crammed full of practical, interesting and informative articles written by leading authorities and by a host of practical successful farmers. And then Farm and Dairy subscribers get, each year, at no extra cost to them, **eight** Special Magazine Numbers and several Illustrated Supplements.

BREEDERS' NUMBER FREE.

Any one of the Eight Magazine Numbers alone is worth a dollar. The Special Breeders' Number, just published Dec. 1, contains information of great value to any breeder of farm stock. This number sells for 10 cents. Send Farm and Dairy, Peterboro, Ont., a two cent stamp to pay postage and request a copy of the Breeders' Number and you may have one free.

THE PAPER DESCRIBED.

Farm and Dairy is ably edited; it features fearless, common sense editorials on agricultural questions of the day, the leading farm news of Canada experience articles by practical men of the soil, who are making money and know how to direct others that they also may make money. Farm and Dairy has departments of Farm Management and a Feeders' Corner—both conducted by J. H. Grisdale Dominion Agriculturist, and D. D. Gray, Farm Foreman, C. E. F., Ottawa. A whole page in each issue is devoted to practical Horticulture, a page each to Poultry, Cheese and Creamery matters.

FOR THE WOMEN.

A well conducted Home Department, with story, religious column, fashions, Cook's Corner and intcresting and instructive other features weekly is maintained for the women folk.

Throughout Farm and Dairy is well arranged, printed in large clear type on high quality paper and is abundantly illustrated with high class pictures of farm stock, farm scenes, and timely photographs of interest. **Send for a sample copy.** You may have it **free.** It will delight you.

SPECIAL MAGAZINE NUMBERS.

Published at just those times when the information is most needed by our readers are the Eight Enlarged Magazine Numbers of Farm and Dairy. The first of these for 1911 will be the Third Annual Poultry Number, out Feb. 2. After it comes the Orchard and Garden Number, March 2; The Great Dairy Number, April 6; Farm Improvement Number, May 4; Farm Machinery, June 1; The Fourth Annual Exhibition Number, Aug 31; Household Number, Oct, 5, and the Breeders' Number, Dec, 7th. Each of these numbers will be worth dollars to you.

LIKE ORIGINAL PHOTOGRAPHS.

Then there are the Illustrated Supplements to Farm and Dairy. In these **Prize Winning Animals** at the leading exhibitions are reproduced on heavy extra quality glossy paper, which shows up the stock as good as original photographs. How much would it be worth to you to have photos of the Prize Winning Stock of Ontario and Quebec? Farm and Dairy Supplements will give these to you.

HOW THE BEST MEN FARM.

A special series of practical essays by Prize Winning Farmers is now running from week to week in Farm and Dairy. These men won prizes in the Dairy Farm's Competition for having the best Dairy Farms in Ontario and are writing of the particular lines in which they have been most successful, as required of them by Farm and Dairy according to the rules of its competition This competition was conducted by Farm and Dairy during the past two years and was open to all Dairy Farmers in Ontario. Is it worth your while to learn how these best men farm?

Farm and Dairy, as its name implies, covers the field of the Farm and of the Dairy. It is for the man who farms and must make money. It helps him to make money. Every farmer in Maritime Canada should take Farm and Dairy. **Prof. M. Cumming, Truro,** says of Farm and Dairy, "I read Farm and Dairy with interest and consider it an excellent exponent of the dairy interests."

All the features as enumerated are but a part of Farm and Dairy. Space forbids that we tell it all. Farm and Dairy is clean, neat and full of the best material obtainable that will instruct and please. It is yours all for

Only $1.00 a year. Published each week

What better Xmas. present could you give a friend! your father! your brother! What better paper could you take for yourself than this great farm and dairy paper from Ontario—Farm and Dairy!

To the farmers of Maritime Canada, who, before Xmas., order Farm and Dairy for one year and mention this advertisement in the "Farmer," we will send, as a Xmas. box, a Farmer's Account Book, bound in cloth, 13 1-4x8 inches, or a beautiful lithographed portrait, 18x21 inches, of the late King Edward or a portrait of King George—the reining king.

Don't delay. Send your order to-day. Get this greatest dollar's worth of farm reading matter for yourself, your friend, relative or neighbor. Write:

LIVE STOCK.

Feeding Cattle on Concentrated Food.

In the course of a report of experiments carried out by Professor C. Bryner Jones, of the University College of Wales, at Aberystwyth, some particulars are given of the results obtained of the use of concentrated foods in small quantities. The first experiment was conducted about two years ago, the comparative lots of cattle being twelve Herefords and eight Welsh three-year-old bullocks. The objects in view was to test the relative value for feeding purposes of two classes of food equal in all respects save that in one ration there was 3 lbs. of concentrated food, and in the other 6 lbs. A former experiment had testified tnat 6 lbs. was more profitable than 10 lbs., and it was suggested that the quantity might be still further reduced.

The cattle in Lot I. had 3 lbs. of decorticated cotton cake and undecorticated cotton cake, and 3 lbs. of barley meal, and to Lot II. half of these quantities were given, while the rest of the ration consisted of 3 lbs. of chopped straw, 10 lbs. chopped hay, and 50 lbs. of roots. The cost of the ration for Lot 1. was 6s. 6d. pet week, and of Lot II. 5s. 3d. per week. Cattle had no access to water until the last manth of the experiment. It was intended that they should not be given water at all, but towards the end of the third month such little progress was recorded, and the weather being dry and warm, it was considered advisable to give such water as was required. From the time of the beginning of the experiment to its close, from December 4th to March 26th, the average increase per head in the case of Lot I. was 1 cwt. 62 lbs., and in the case of Lot II. 1 cwt. 68 lbs., while the percentage of carcase to live weight was 53.1 per cent and 51.4 per cent. The average daily gain was .5 lb. in favor of the bullocks having the smaller ration.

This experiment does not appear to be entirely convincing, and certainly it would reuaire to be conurmed on a larger scale before being accepted. There are other things to consider than the mere saving of cattle ration, as every farmer who feeds knows. There is that not least important matter—the way in which bullocks die, and the readiness of the butcher to bid for lots from certain feeding courts, knowing as he does that he gets the maximum weight in the carcass. Bullocks tnat die light are apt to give the feeder a bad reputation, so that it is not always saving that is affected in economizing the ration.

Experiment 2 deals with a ration with and without water. Here two lots of cattle were fed on the same ration, one being given water and the other none. The ration consisted ¾ lb. of linseed cake; ¾ lb. of undecorticated cotton cake, 1½ lbs. of chopped straw, 6 lbs. barley meal, 10 lbs. hay, and 50 lbs. roots. The hay was given long, night and morning.

It would appear that the cattle receiving the water made the larger increase, from December 13th to April 5th making on an average 1 cwt. 104 lbs. in the case of Lot 1., and 89 lbs. in the case of Lot II. The average daily gain was represented in the case of Lot I. as 1.19 lbs., and in the case of Lot II. as .89 lbs. Taking off the value of the food, and allowing a certain proportion for manurial value, the profit fit on Lot I. was estimated to be £2 12s. 2d. per head, and in Lot II. 18s. 6d. It is deemed advisable to give cattle receiving not more than 50 lbs. turnips daily free access to drinking water. If water is denied to feeding stock for a time, the increase in weight is very marked when they are allowed access to it again.

In the feeding of pigs, cooked and uncooked foods were tested. Six pigs were used in the experiment, being of the large Yorkshire and Berkshire cross. They were fifteen weeks old at the beginning. The ration given to Lot I. was 3½ lbs. boiled potatoes, 2½ lbs. barley meal, and to Lot II. the same quantities, anly the potatoes were raw. The potatoes were boiled in sufficient quantities to last a week, and were supplied cold, whereas the potatoes, in the case of the second ration were pulped after being thoroughly washed. The potatoes and meal were mixed with water, and then supplied to the pigs. The total gain in the case of Lot I., which had the boiled tubers, was 1 cwt. 98 lbs., and in the case of Lot II., 1 cwt. 73 lbs., a difference of 25 lbs. per lot in favor of cooking, over a period of six weeks. This is equivalent to about 8 lbs. per pig. A shilling was reckoned a fair charge per week to cover the cost of cooking, so that, allowing far that, the total gain in Lot I. is valued at £2 17s., and in Lot II. at £2 15s. 6d., or 10d. per pig in favor of cooking potatoes.

These results are in accordance with those obtained the previous winter.

Choosing Good Feeders.

The wisdom of the choice of feeders is shown when the cattle are marketed and the butcher cuts them up. The illustrations show the di. in retail price of tne different cuts of beef on a good and a poor steer.

MARKET VALUE OF THESE STEERS.

The following is a comparison of weights of the different parts of the steers shown here:

	Prime steer Lbs	Common steer Lbs
Loin	140	105
Rib	72	56
Round	200	149
Chuck	208	164
Plate	100	77
Flank	24	19
Shank	28	19
Suet	28	31
Total	800	620

The following table shows the variation in price per pound:

RETAIL PRICES PER POUND.

	Prime steer	common steer
Loin	20@30c	15@25c
Rib	18@22c	16@20c
Round	10@18c	10@16c
Chuck	9@14c	10@13c
Plate	9@12c	9@11c
Flank	6@15c	6@15c
Shank	5@ 8c	5@ 8c
Suet	5@ 8c	5@ 8c

The prime steer dressed 6 p. c. more economically than the common steer, the most valuable parts sold for more per pound and weighed more. The accompanying figures show how much variation there is, and just where that variation comes. The most valuable cut is the loin, and there is a difference of $1.57 in the value of the loin in the good and poor steers.

Remember, that only the weight but the quality, and consequently the market price, is better in the good steer. Note the difference in conformation in these two animals. The good points to be looked to in picking out steers are: Wide forehead broad muzzle, wide back, deep sides, low flank, square rump, straight top line and under line, and a short, thick neck.

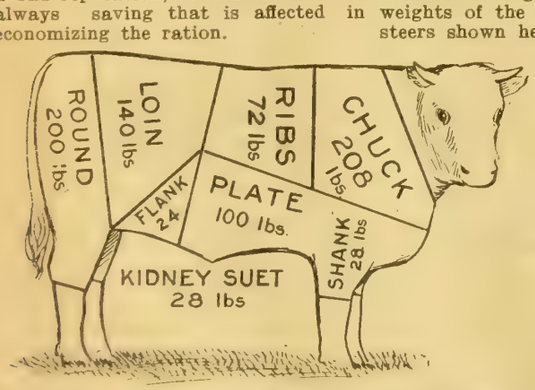
The weights given represent averages of different tests with common steers and prime steers. The retail prices given represent the current Chicago quotations, but are subject to wide variation, according to the locality, method of cutting and condition of the meat.—Louis D. Hall, Assistant Professor of Animal Husbandry, Illinois Agricultural College.

Feeding Milking Shorthorn.

In getting together as many as possible of the creditable official dairy records of Shorthorns in this country and in England, and in tracing the pedigree of these best milking cows back through the different tribes to the original stock, the blood lines most influential in preserving the milking function were studied.

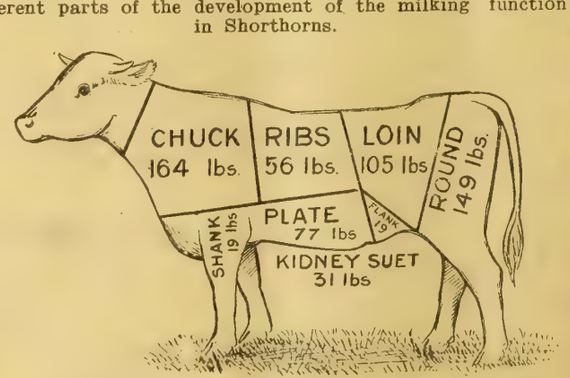
The early history of the Shorthorn breed has also been carefully studied, so that it is now known that originally among Shorthorn cattle there were those possessing good milking qualities.

A detailed study of Shorthorn breeding also shows that the best milking Shorthorns of the present time are the result of the use and development of the milking function in Shorthorns.



Steer of Proper Form Showing Cuts.

This steer weighed 1300 pounds alive and 800 pounds dressed This makes his dressing percentage 62. He is an example of the most profitable steer to feed. Note the broad head, straight, level back and deep flank.



Unprofitable Steer, The Kind not to Feed

This steer weighed 1100 pounds alive, and 620 dressed. His dressing percentage was 56%. His low back, high flank, narrow head and narrow back are all undesirable in a beef steer.

All Skin Diseases Can be Directly Traced To BAD BLOOD.

Therefore to get rid of these skin diseases it is absolutely necessary that the blood should be thoroughly cleansed of the accumulated poisons, and for this purpose there is nothing to equal Burdock Blood Bitters.

This remedy has been on the market for over thirty-five years and when you use it you are not experimenting with some new and untried remedy.

Miss Stella Eichel, Maitland Forks, N.S., writes:—"I have been bothered with Salt Rheum on my hands for three years and it itched so I didn't know what to do. I tried everything but nothing seemed to be any good. I heard of Burdock Blood Bitters and bought two bottles of it, and now I am perfectly cured and have no Salt Rheum on my hands any more. I cannot speak too highly of Burdock Blood Bitters."

Without going into details, the care of Shorthorn cows, to give the best results in dairy work should be very similar to the care of the "strictly dairy breeds" of cows. However, in some respects the management is simpler and in others it is more difficult.

The following of the right blood lines in our breeding and development of milking Shorthorns is one of the great keys to success in this work. In tracing the pedigrees of fifty milking Shorthorn cows in this country and in England, all with yearly records of over 9,000 pounds of milk, it was found that very definite blood lines were followed. Both the sire and dam of each of these fiftycows were traced back through the different tribes of the original sire. The pedigrees of these fifty cows with about seventy others with yearly recards of 8,000 pounds of milk were extended for five generations, and both in the fifth generation and in the tribes through which these fifty cows traced from the fifth generation back to the original stock the names of the tribes that occurred most frequently, were the Duchesses, Oxfords, Waterloos, Cambridge Roses, Hild Eyes, Foggathorpes and Red Roses.

It is also definitely known that the best milking Shorthorns and the most meaty Shorthorns trace back to original stock with good beef form and also possessing good milking qualities.

It should be borne in mind that in the particular problem of developing milking Shorthorns, the two characteristics, milk producing power and beef producing power as history shows are not entirely antagonistic, but that both may exist well developed, in the same individual animal.

Let us know the history of the breed of cattle with which we work, so that we may intelligently interpret their pedigrees.

Let us make use of all the principles of animal breeding in our work, and combine this with the best of care and management. Let us use history and long time records in our work, and require our animals to be regular breeders as well as good producers at the pail.

These five cows are among the fifty that trace back through the families above mentioned and they are all the result of right care and management and systematic handling of the blood lines in order to preserve and further develop the milking functions.

Lulu.—Vol. 63 page 824, red and white, calved March 20, 1902 bred by B. W. Lewis, Ashville, N. Y. Owned by Missouri Experimental Station. Yearly record, 12,341 pounds of milk 605.6 pounds butter.

Darlington Cranford 5th. Vol. 47, 47, 50, 51, pages 744, 798, 822 and 908, red, calved Oct. 26, 1897. Bred by Geo. Taylor, England. Owned by Lord Rothschild, England. Yearly record 12,567 pounds of milk.

Mamie Clay 2nd. Vol. 48 page 342, red and white, calved Dec. 15, 1899, bred by J. K. Innes, Granville Center Pa. Owned by Inness & May, Granville Center, Pa. Yearly record 13-231.1 pounds of milk.

Rose of Glenside. Vol. 57, page 745, red and white, calved Dec. 19, 1900. Bred by Innes & May, Granville Center, Pa. Owned by Innes & May, Granville Center, Pa. Yearly record 18,075.2 pounds of milk, 624.-76 pounds butter fat, 735 pounds butter, daily average for entire year 49.5 milk, 20.1 pounds butter—Geo. J. Baker, St. Paul, Minn., in Farm Review.

This Feeding Floor Could Be Built in The Fall

and it would help greatly to preserve the condition of your live stock in the Spring.

Every farmer knows that in the Spring of the year his barnyard is almost bottomless. The live stock mire down into the mud and almost float around—greatly to the detriment of their physical condition.

By building a Concrete feeding floor in the yard, this trouble is done away with.

A Feeding Floor of comparatively small area and built this Fall, would pay for itself next year. Concrete is the only material that can be used in this way at a moderate cost.

Will you ask for your copy of the book which we have prepared for you—*"What the Farmer Can Do With Concrete"*? It's free—and, take our word for it, you'll find it one of the most interesting pieces of such literature you ever read. And profitable, too—because it will save you money.

THE HORSE.

Sound Practice in Colt Management.

The future value of colts, their constitution and hardiness, depend to a great extent on the way in which they are looked after the first winter. During the first winter, the feed and care should be such as to keep the colt growing vigorously and at the same time to make it hardy and develop a good constitution. Too many of us have an idea that a colt is a delicate creature and therefore should be warmly housed during the winter. This is a mistake. It is much better to keep the colts in dry box stalls which are always fairly cool and allow them to run out almost every day in the winter for at least three or four hours. We keep them in only on very stormy days and of course our colts kept in this way never look sa nice and sleek as colts kept in warm box stalls.

APPEARANCE NOT CONSIDERED.

Some of our neighbors who do not appreciate the value of building up a strong constitution in the young animal are inclined to look rather disparingly on our shaggy looking animals. We do not worry about this, however, for we know that we get the best animals in the end. When visiting the Nova Scotia Agricultural College last winter, I noticed that their colts are handled in exactly the same way as ours and they looked just as rough—they breed the finest Clydes in the province at the N. S. A. College.

In feeding the colt, the idea should be to give feeds which are full of bone and muscle producing elements. This shuts such feeds as corn and flax-seed altogether out of the ration. Crushed oats and bran are the ideal feeds for feeding to young colts. We believe in letting the colts run out for water. This compels them to go out whether they want to or not on cold days.—E. F. Eaton Colchester Co., N. S., in Farm and Dairy.

Clipping Horses.

When clipping horses, judgment on the part of the owner is required as sometimes this practice is beneficial and at other times harmful. Horses that have smooth, fine, short coats are neither improved in appearance nor physically benefitted by clipping. Horses with long, rough coats are improved in both appearance and physical condition by clipping, providing they are comfortably housed and blanketed when standing either in or out of the stable.

When proper care is given the horse, clipping increases the action of the circulatory, respiratory and digestive organs with consequent greater vigor in the animal. This improvement in vigor is evidenced by the lessened tendency to congestion or stocking of the legs so common in long, heavy coated horses when allowed to stand in the stable for several hours at a time.

CLIPPING HEAVY HORSES.

A good system of clipping for heavy horses is to clip the head, neck and body leaving the hair on the belly and legs. This is not so pleasing in appearance, but it permits of easy clothing of the clipped parts and does not expose the limbs so severely to extreme cold.

Idle horses are not benefitted by clipping. Farm horses if they have not shed their winter coats before spring work commences are benefitted by clipping in the manner already given. Road horses, if not fine coated are improved by clipping, providing they are properly cared for. For the sake of appearance road horses should have the belly and limbs clipped. They should never be left standing outside in the cold, however, if clipped.—Dr. J. S. Standist, Prof. Veterinary Science, Truro, N. S., in Farm and Dairy.

Fitting the Collar.

One of the most important duties on the farm is to keep the working horses in good order this being necessary because so much depends on them. The horsekeeper should therefore be well up to his work and quick to notice anything amiss with either horses or harness. Many of the ailments from which team horses suffer are caused by ill-fitting or badly stuffed collars and saddles, as far as shoulders; while neglect of shoeing results in corns and other feet troubles. High calkins or careless or incompetent blacksmiths may also produce mischief. Sore shoulders, fistulous withers, and bruised backs result from hard linings more than from any other cause. It is consequently necessary to inspect them every day, dry the lining and beat [illegible] to prevent the stuffing from becoming matted together underneath. It involves trouble, of course, but anyone who has dealt with the ailments indicated knows that prevention is not only better than cure, but it is also far easier to the horsekeeper who undertakes the treatment for cure. A responsible man should examine the workers under his care both morning and evening, so that the least chafe may be observed and immediately treated.

Collars are very likely to chafe young horses that are fresh to work. It is advisable to accustom horses when their colthood is almost over to go in any part of the team; then none need have a sore back through constant saddle pressure.

Should Stallions be Worked?

The question is sometimes asked, Should stallions be worked? The point is of more than academic interest, for it gives expression to a widely-held belief that it is to the advantage of a sire to be broken in chains and harness. The laws of our roads, at least of our towns, unlike Continental laws, do not permit of the working of stallions in crowded thoroughfares, but there is no law against the use of the stallion in the ordinary operations of the farm, writes an authority in an English exhange. Usually the stallion owner possesses not one, but several horses consequently there is no necessity for working them, as the ordinary farm work is undertaken either by geldings or mares. Where the individual has a stallion which he keeps for use in the neighborhood the question deserves to be further considered as to whether or not the advantages outweigh the disadvantages. It is clearly an advantage to develop the muscle of a stallion either in chains or in cart. It is this additional advantage which renders his temper more docile and he is more amiable to handle.

Most breeders, however, look upon he subject from a different point of view. They contend that the exhaustive work of a season demands compensation in the form of a rest, and usually paddock life during the off season is the lot of the stud stud horse. Again, there are stud horses which breeders think are too valuable to take any risks with, consequently they put them where they can get outdoor exercise with the least danger to themselves and at the same time derive all the benefit accruing from fresh air. In the majority of cases, however, it would be an indubitable advantage to exercise the stallion at ordinary farm work and prior to the season to fit him again in appearance as well as in fact for his work. ...

Balancing the Foals.

The foal should have its feet "trued" and "balanced," regularly. Every four or five weeks, oftener if irregularity in growth is observable, or if the foot has become out of "balance" by a breakage of its wall, at any point. Not infrequently the feet of the foal will be found to be "out of balance" at a very early date after foaling. I have had them "trued" and "balanced" at from five days old up to as many weeks of age. I will give you a case in my own experience with a yearling of my own. Up to the time that this filly was ten days old she could do nothing but pace. I had the smith lay the little thing down on the grass and with his knife whittle the soft feet, as I had directed him to do. When he had finished and she stood up and was started off, she immediately trotted even and true. She has not once since shown any inclination to amble or pace. She is now eleven months old, her feet are "trued" and "balanced" regularly every four weeks, and I challenge any owner to show one of her age that as a "lot trotter" with no particular education, just simply "go as you please" can show more speed at the trot, and a more determined and purer gait at the trot, than this little thing can. She fairly loves to trot. Why? Because she is "balanced" and the trot and run are the only gaits that are comfortable to her. It is a positive treat to see this little thing "catch" from its run—and oh, my! how she can run! Her dam is part thoroughbred running blood, in her breeding—to its trot, without the sign of an amble or hesitation of any sort, it "breaks' and "catches" like some well trained trotter, with a skillful trainer holding the reins. If the feet of the foals are kept constantly "balanced" when they are sent to the forge for the first shoeing, the smith will need only to smooth off the feet and adjust some, light narrow-webbed shoes and he will find that the young thing will submit to the operation as patiently as any old horse accustomed to being shod.

HORSEMEN ATTENTION!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. They cure Cough, Cold, Distemper, Colic, Glanders, Spavin, Pink eye and all diseases of the Horse.

TRURO, N. S.

Dear Sirs,—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse liniment. The cough was of twelve months standing. In my large expeience with horses, I consider this liniment to be the best made for all diseases of the horse, and I recommend it to my friends.
E. J. ANDERSON.

BEAR RIVER, N. S.

DEAR SIRS,—
We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it.
Yours truly,
CLARKE BROS.

It Works While They Work

If horses go lame, you don't have to lay them off to cure them. Kendall's Spavin Cure works while they work—and cures them while they earn their keep. For Spavin, Curb, Ringbone, Splint, Sprain, Swollen Joints, Lameness

Kendall's Spavin Cure

"Completely Cured Him"

Moose Jaw, Sask., Oct. 13th
"Two years ago, I bought a colt that was badly spavined, and completely cured him with only two bottles of your Spavin Cure. Worked him steady all the time and sold him last winter for a top price."
Howard Brock.

POULTRY.

Poultry Records

W. I. Thomas, Crossfield, Alberta, writing in the Nor' West Farmer, says:

"The keeping of individual records of performance among dairy cows has transformed the dairy business. Regular record keeping in the handling of farm poultry would work a change even greater than that brought about by dairying. The amount of tedious, hard work which is worse than thrown away by the average farmer's wife on unprofitable poultry is the most amazing thing to me in the whole catalogue of farm affairs. I have seen a farmer's wife feed two gallons of good wheat three times a day to a large flock of hens which did not lay an egg during the cold weather when wheat fit for seed was bringing a dollar and a half a bushel. Because they handle the money which the eggs and chicks bring in, hundreds of farmers' wives, when they are already overworked, go through the toil of raising chicks and caring for the breeding stock in winter, when, if they would take the feed which they give the poultry to town and sell it, and besides that save the other items of expense from poultry, they would have more money than they get from the poultry products. I know that hens eat a good deal that is of little value, but they eat a great deal that is valuable, and on most farms they are allowed to destroy much that would be valuable.

"I am not saying that poultry on the farm does nat pay. Properly managed, poultry is the most profitable part of farm stock. What I am saying is that, except in a very few cases, where a large flock of hens is kept on a farm, with no distinction made between good and poor hens, and wintered in a house which could not properly accommodate half the number, which is the usual practice, and no account kept of outlay and income from poultry the hens are kept at a money loss, ta say nothing of the wasted time and labor.

"This will astonish some who think their hens are paying the grocery bills; an actual account would astonish them more. It was a great surprise to me when I first began to keep track of my hens. I think it was a surprise to them too, for a good many of them lost their heads. I found that it took from four to six good hens to feed one poor one. That meant from five to seven hens housed and cared for, just for pastime with no profit. You don't need a terrible lot of poor hens to be doing your work for nothing."

Prof. Landry, of the Nova Scotia Agricultural College Truro, has done much good in interesting poultrymen in keeping records of the production of their poultry. Many poultrymen followed his advice during the past season and the results obtained were really astonishing. We will endeavor to give our readers some of the individual records in the near future.

Judging a Hen bv Her Appearance.

A writer in Feathered Life tells how he gauges the laying qualities of his hens by their appearaoce. He says: How are we to judge which are the layers and which are the drones? My method is to judge by their looks and actions. There is as much difference in the shape, disposition, and appearance of hens as there is in individual cows orhorses. The difference in characteristics can better be judged in pure bred flocks than in flocks of mongrels, for with the former, when you have studied the breed you have adopted, as everyone should, until you have the shape imaged in your head, and can recognize it anywhere, you have more uniform individuals to judge; while with mongrels and crosses, after the first cross, especially, you never know what you are going to get either in shape, color, eyes, comb, or general characteristics.

A hen that is soonest off the roost in the morning, and the last to retire at night, is what we call a hustler. She is looking for something to eat from which to produce an egg. A hen, to produce eggs in large quantities, must have good capacity to take food and good digestive organs to digest and assimilate the food eaten. You naturally, therefare, look for a long keel, apparently lengthened by a full breast, filled out square with the keel by a good full crop. In such a hen the abdomen, while not bagging down much, will be distended, showing egg capacity. You seldom see a hen narrow between the legs and abdominal lines straight back from the legs giving her a squeeze-in appearance from behind, that is a heavy producer. She is like a dairy cow built on beef lines. I prefer a hen with legs well apart, full.breasted, with well-developed abdomen. This indicates stamia and vigor. If she has a bright eye, red, healthy-looking comb and head adjuncts, and has that alert carriage coupled with the other characteristics mentioned, she is pretty surely a profitable hen, and watching will prove her the bird for the breeding pen to increase your egg production and at the same time a carcass built on these lines is capable of supplying a trade for fancy table food.

Soft Shelled Eggs

It is a general belief that soft-shelled eggs are due to a deficiency in the supply of lime to the laying hens. At the Kansas Experimental Poultry Farm, experiments were carried out to throw some light on the subject. It appears that hens subject to much nervous excitement are liable to lay soft-shelled eggs, due ta nervous shock and analogous to abortion in other animals. It is known than on the ordinary diet a hen's system usually contains enough lime for the shells of five or six eggs. If lime is withheld, then, after laying five or six eggs, the hen will cease laying; but if lime in limited amounts be given the hen will lay eggs in proportion to that amount, through the shells on examination may prove to be somewhat thinner than usual. In addition to grit, lime must be supplied in the form of snell-grit or oysters. Old plaster is also very satisfactory.

There's Money in Hen Manure.

I think very many poultrymen are throwing away an oppottunity to save a dollar by neglecting to utilize their hen manure. This applies especially to those who have farms and gardens. Last winter we saved a ton of fine dry hen manure which we stored in barrels and boxes in a dry room of the barn. A pile was also made in a corner of the same room which was occasionally shoveled over to avoid heating. That in the barrels and boxes gave no trouble in this respect. We also saved a ton of strawy manure which was taken from the floors of the poultry houses. This latter was spread broadcast and harrowed in on ground prepared for oats. It was used in combination with a light dressing of stable manure on one piece of oats, but they did no better than those treated with hen manure alone.

ONE AND ONE-HALF TONS OF FERTILIZER FOR $12.

The ton of fine dry manure was mixed with 1000 lbs. of acid phosphate and 200 lbs. of muriate of potash, making 3200 lbs. of high grade fertilizer at a cash outlay of about $12.00 This was used on all garden land and some of the field crops, corn in particular.

The potato land was lightly dressed with stable manure and a liberal amount of hen manure and wood ashes, half and half, was applied in the hill. In preparing this mixture it should be tharoughly worked over with shovels, and then used immediately and covered in, to avoid loss of nitrogen in shape of ammonia gases, which are set free by the rapid chemical action.

Potatoes need a large amount of potash in order to do their best, and waod ashes is one of the best sources. The man who throws away his ashes is throwing away dollars, especially if he grows potatoes or other root crops. Our crops never looked so well as now, and we owe it to the intelligent use of hen manure.

Good fertilizers, the commercial article, are sold at $25 to $45 per ton and I have never used any of them that would beat the combination mentioned above. To conserve the desirable properties of hen manure, the nitrogen in particular, I would suggest spreading the acid phosphate on the droppings boards, then storing as stated. By weighing the manure made in a given time, it would be easy to keep the proportion right, and all danger of heating would be avoided. At the same time the houses would be kept in a more sanitary condition with very little labor.—Cyrus Batchelder.

Utility Hens.

Practically every advertiser of poultry or eggs has in small type in some inconspicuous place in his catalog a paragraph relative to his utility stock. He will tell you that the utility eggs are laid by hens that have not won in the shows because cause of some minor characteristic that barred their entry. It may be that these birds are a trifle off in weight, they may have a few defective feathers or there may be some other matter of slight importance, something that to the average person seems a trifle but to the fancier is of paramount importance.

As a matter of fact the larger share of the poultry in Canada are utility birds. For each fancier who stands irretrivably for perfection in the minutest detail there are hundreds of farmers and city lot poultrymen to whom good fresh eggs and tender broilers are of far greater importance. This is not a plea for scrub or inferior stock but rather for good, practical utility birds—birds that return profit through the egg basket. The utility bird is just as pre-eminently a pure bred bird as one that captures the ribbons in the ost exclusive show. She has size, she is well bred and she possesses the characteristics that make pure bred stock valuable. Were more attention given to birds of this kind there would be fewer failures and less discouragements among the would-be poultry keepers. Many a person has begun in business with the intention of establishing a great reputation only to become discouraged because of two or three years of difficulty. There are many things to learn in handling poultry and we hear much less about failures than we do about successes. In fact, for every success that is heralded in print many failures are buried from public view. There would be fewer of these if we gave more attention to utility stock.

Grades of Eggs.

In grading eggs, says John Gunn, a Montreal exporter, we divide them into a number of grades as follows:

Selects, which consist of sound, good sized, fresh, reasonably clean eggs. No. 1, sound, under-sized, shrunken, stained washed or salted eggs. No. 3. cracked, gallo eggs. No. 4, rots, total loss.

Now the ideal egg is one that weighs about one and one-half pounds to the dozen. This is the standard size for export, and, generally speaking, meets all conditions.

No one disputes the splendid quality of Red Rose Tea. Here in the East as well as in the West it is used every day in thousands of homes where its unvarying fine quality has been proven by years of continuous use.

PILES CURED at HOME by New Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309, Windsor, Ont.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making This aid may be given in the form of short articles dealing with your experiences questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Mrs. Bowen's Parlor and Spare Bed-Room.

(Continued from last issue.)

"What do you want?"

"I want you to shut the door after you, and don't go tracking through the house that way. Where's Albert? What were you doing up garret?"

"That's my business," answered the boy, in the same unfilial tone, as long as I ain't in your way. Al's gone to the Vigilant meeting, and I'm going too. Tell pa Mr. Waterman says he can send in his bill again next week." And a slam of the two doors that lay between the sitting-room and the street announced his departure.

"O dear!" sighed Mrs. Gerry. "I do believe there never was such children as mine. Mary Jane and Sarah's as wild as two hawks, and those boys go to every fire in town. Why, the night Tremper's soap factory burnt down, I never closed my eyes. Both of them there till daylight, and their father gone to Hornellsville. To be sure, I'm thankful to have them out of the house, generally. Your children are all little, Mrs. Toby, and you've no idea what a state such boys keep the house in. Whittling and hammering from morning till night, and whistling and shouting. It's enough to make people distracted. What was I saying about Mrs. Bowen?—oh, using her parlor."

"I don't see how folks can afford to keep so many fires," said Mrs. Toby, edging up a little nearer to the dull stove.

"Oh, that's what made her use the parlor. She finds that big stove heats the sitting-room enough for meals, and keeps the old lady's room comfortable, too, except the coldest of weather. I don't see what's the matter with our lamp. Just wait a minute, Mrs. Toby; I'll pick it up a little. Seems to me the oil gets worse and worse."

There was no complaint to be made of Mrs. Bowen's lamp, that evening—of either of her lamps, we should have said, for there were two upon the table, reflectiag almost as much light as they gave, they were so brightly polished. The table had been rolled in from the sitting-room, and was only cherry, it is true, but it was covered by a large cloth, blue and crimson, that would "wash equal to new." Mrs. Bowen's spool-basket stood near the lamps, and she seemed to enjoy her sewing, as she looked up around the room, and back again to her stitching with renewed industry. A cheerful fire was glowing in the open stove, and Kate, on the other side of the table, was so occupied with her crochet-needle and the printed pattern before her, that she had no time to talk.

Presently, the door from the dining-room to the kitchen "opened hard, and John, a bright-looking boy of twelve, came in boisterously.

"Gently, gently, my son; and what hair! Not fit for the parlor, that's certain, or those hands either." So the lad disappeared for a time, and came back more quietly, in parlor order.

"Where's my 'Harper'? Kate, have you my 'Harper' again? Mother, Kate always—"

"No, I haven't." And a magazine cover of a very different shade of yellow was exhibited. "I've just got what belongs to me—the 'Lady's Book.' "

"There's your 'Harper' under grandma's 'Observer.' Don't go too fast, John. How about lessons, though?"

"Oh, it's Friday night, and we've got all day to-morrow to learn them."

"Too much time is worse than too little; I used to find that out. I can remember when I went to school."

"Isn't it funny to think mother ever went to school?" said Kate, pausing, with her finger on her place in the tidy receipt.

"Real funny. I guess she always had first rate lessons. Father says she always does everything about right. Well he does, mother! I heard him tell Mr. Gerry so, at the store, when they were talking about taking the magazines."

A glow filled Mrs. Bowen's heart. What can give greater happiness than the confidence of a husband and the fond praises of a child.

"Well, about the lessons. I used to put off mine just that way, and they would be hanging over me all through Saturday and Sunday, too, for that matter, so that I never really enjoyed anything. Our teacher used to say that she always had worse lessons on Monday than any other day in the week."

"O dear!"—and the crochet-needle was laid down fretfully—"I never shall get this done before Christmas.

"I should think you might let me finish this one thing." And John on finding his place in the magazine. "I had to go to bed right in the middle of it, last night. It's all about Robinson Crusoe's island. See! there's pictures of everything."

"You know the agreement," said Mrs. Bowen, quietly; and, after a few more lingering looks, she had the satisfaction of seeing them both subside into their school-books, their attention quickened by the desire to get back to more agreeable employment.

A quiet hour passed. Mrs. Bowen's needle flew along rapidly; the two brown curly heads bent studiously over the open books; grandmother's distinct breathing, as she fell asleep on the settee in her own room, was distinct in the stillness.

A long, low whistle was heard under the window, presently. Johnny's head came up, and he listened for a moment, then all was still again. Once more the signal sounded, so prolonged that John started and hurried for the door.

"What is it, John?"

A look half eagerness and half annoyance passed over the boy's face. "It's Al Gerry, I expect, mother. He offered to stop for me to-night."

"Ask him in, my son." And Mrs. Bowen went on with her work.

"Where's my cap? I don't believe he'll come in, though."

"No, he says he can't," said John, after a parley at the hall door. "Come in, Al; it's only mother and Kate. I don't believe I can go; I didn't say a word to father about it—I forgot."

"Teaze your mother, then; she'll let you off," whispered the awkward shamefaced boy. "Come along, if you're coming."

"Ask Alfred if he won't come in and stay here this evening," said Mrs. Bowen, rising and going out into the hall. "Where were you going, boys?"

"Tell her round the corner," whispered the visitor again, slinking as far out of sight as possible, but seeing the bright, cheerful looking room, nevertheless, and thinking how good the fire looked.

"We were going round to see the new engine, mother, round to the engine-house. They say she's a beauty, and they are going to have crackers and cheese and things."

"Oh, a treat," said Mrs. Bowen, pleasantly. "Tell Alfred he shall have some nuts and apples, if he'll come in. I think our parlor is a great deal pleasanter than a cold engine-house."

"That's a fact." And John shivered and thrust his hands in his pockets, as the cold wind rushed in. "La, come in Al; mother won't eat you up, and I'll show you the greatest lot of pictures, all about Robinson Crusoe's Island. I guess I don't care about going, any how"—for there was an enchanting contrast between the cheerful room and the dark cold street, at that moment.

"You're real mean; you promised," muttered the lad. "Catch me coming round for you again." And he closed the parley by an abrupt leap off the front steps to the pavement, darting away round the corner.

Good management had spared Mrs. Bowen the necessity of forbidding the expedition, and there was no ill-will between mother and child to cloud the evening.

The lessons were finished but cracking a dish of nuts in the dining room had suspened the explorations of Jaun Fernandez for the present, and Kate had rubbed the Spitzenbergs until their red cheeks shone invitingly, by the time it was accomplished.

"Now, if father would only come in!" the young handmaiden said, as she brought the plates from the closet. "Don't it look real cozy?"

"I guess Al wishes he'd stayed by this time." And John helped his mother generously. "I know how it is. The men like to have us boys praise the machine, and 'bet' it will beat the other, and pat us on the back, and say, 'Just see, now, he knows! La, the "Goody" can't begin to come to tea!' And th?n, after awhile, they get to drinking, and smoking, and telling funny stories—the kind you don't like mother"—for John did not think it proper to explain any further before his sister.

"I hope the boys go off, then?"

"O no, they don't always; that is, they hang around, and get a drink, and the ends of the cigars. I know."

It was rather an indiscreet revelation for Master John, providing that he had not renounced the engine-house altogether.

"I think Al Gerry's real hateful,' said Kate. "There's grandma awake here, let me hide my tidy, mother, or she'll find out it's for her. Never mind, I know my lessons now, and I can work a whole hour on it to-morrow. Here's your chair, grandma." And she helped to instal Mother Bowen in the parlor rocking chair with much more alacrity than she would once have shown in her service. But "grandma" had come out wonderfully in the last two years; bodily comfort had softened and their mother's constant example the repining, discontented spirit; of attention to her wants had gone much further than precept.

"What d'ye say about them Gerry's?" inquired the old lady, in rather an elevated tone of voice. "I heard you say something or 'nother about them, hey?"

"I said I thought Al Gerry was real hateful. Well, he is, mother; you ought to see how he teazes us the minute we begin to play nicely. I wish I didn't have to go with the the Gerry girls, anyhow; I don't like 'em?"

"Why?" said Mother Bowen; "they are as good as you be."

"No, they ain't," said Kate stoutly. "They never know their lessons and they're always running and racing through the street; ain't they, John?"

John was too much occupied for words, but he gave a decided nod in the affirmative.

"Their clothes is good enough"—and grandma drew forth the blue handkerchief. "Better'n yours. I saw 'em last Sunday going home from church; they had on silk frocks, and their ma had one, too, that I never saw before, and a muff. Why don't you dress Kate more, 'Liza? She's getting to be a pretty big girl; folks won't care about going with her."

"That wouldn't hurt my feelings, mother, no one bit. I don't care about her going out much. Lucy Allen comes here more than she goes anywhere, I guess, and our minister's daughter is good enough company. I wonder who's with father; here he comes, talking to some one. Kate get a chair; Johnny, open the door, so your father can see."

"My, how comfortable you do look!" And Mr. Gerry, who loved ease, stepped in, in advance of his host, rubbing his hands, and pausing a little as the bright light met his eyes.

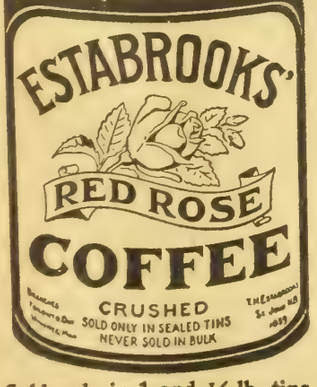
"I wasn't going to come in at first; I thought you must be having company, it looked so light in here. You don't go in for economy, do you, Mrs. Bowen?" And though he enjoyed his neighbor's luxurious living, he thought it was "lucky" he had such a careful, saving wife at home. Such a fire, and two lights every night, would soon "eat a hole" as he expressed it, into the year's accumulations.

"We go in for being comfortable." And Mr. Bowen, who was now a pretty thorough convert to his wife's heretical doctrines, drew off his boots in the hall, and set his feet into the slippers Kate brought to him. "Slippers and all, you see"—and he held up one foot and then the other. "My little girl did those, every stitch—didn't you Kate? out of 'Lady's Book,' or whatever that comes with Johnny's 'Harper.' Well,

Estabrooks' Coffee

is quality coffee from top to bottom of the double sealed air tight tin. It is as easy to brew as Red Rose Tea with an equal result in goodness.

The final proof is in the steaming, fragrant breakfast cup.



Sold only in 1 and ½ lb. tins.

Try it for breakfast to-morrow

Johnny, how about Robinson Crusoe?"

"Well, some folks saves, and some folks spends," said Mr. Gerry, helping himself to a Spitzenberg, and attacking it without knife or plate. "I feel it my duty to lay up for my children. That's the good old way, isn't it, Mrs. Bowen?"

"That's what his father and I did"—and the old lady sat up straighter with the reflection. "Don't no where he'd have gat his start if we hadn't.

"True enough, mother; but it is not necessary for me to be quite so saving, you know, because I had the start. I can afford to live different, and times are different."

"Don't you think, Mr. Gerry," said Mrs. Bowen, picturing poor Al in the smoky engine-room, exposed to moral contagion, "it's just as well to spend a little to teach children how to make a good use ofwhat they will have."

"I haven't got no pride about me, I believe. What was good enough for me is good enough for my children. Common school education, and good figuring, that's about all they want." Mr. Gerry began to think it was his duty to bring his old neighbors down a peg or two, they were getting so set up. "If you want to have your children genteel, you're doing it."

"No, that isn't the word, exactly. I want to bring them up so that they will never be ashamed, no matter what company they are in; and encouraging them to read and find out about the world, and what's going on in it, is one way to help them along."

"Give 'em plenty of money, and they'll get along fast enough! Hickory nuts are high this year, ain't they? That'll do, Johnny; but you seem to have about all that's going. Now, to be real, candid, Mrs. Bowen, don't you think you could get along with one light, and just half the fire? My wife would." And, unaware of the real impertinence of the speech, Mr. Gerry looked around triumphantly.

"How are Mrs. Gerry's eyes?" inquired Mrs. Bowen, so gravely, that her husband looked up from his nuts to see if she had understood the implication of wastefulness. "I heard they troubled her again."

"Well, they do, considerably. The doctor says she's strained them some how, and she mustn't use them much. She's had to hire a good deal of sewing this fall, and it's put her out, for she likes to save about as well as I do."

"I always told Mrs. Gerry she sewed with too little light evenings; I strained my eyes that way myself, when I was a girl and lived with Aunt Peck. Oh! Oh! Couldn't I get along with one lamp? Wasn't that what you asked me? I don't think I could, sewing on John's clothes; black work at night is so bad for the eyes."

"Well, I guess I must be going. How well your ma looks. Haven't had so much rheumatism this year have you Mrs. Bowen.

The old woman nodded her head, sagaciously. She had been trying very hard to keep up with the conversation, but only a word now and then had reached her.

"No, I'm as spry as a young girl now. The house is so warm all over, we don't none of us ketch cold. We hain't had a doctor inside of it all winter, have we, 'Liza? It's a wonderful stove for giving out heat; and keeping all the doors open, we don't have but this one fire out of the kitchen."

"Oh, sit down now; don't be going just yet," said Mr. Bowen, as his friend made a decided move for his hat. "It's early, only just half past nine."

(Continued next issue.)

The next time you don't feel just right, let us buy a 50-cent bottle of Psychine from your druggist to give you to cure your indisposition and prevent worse ailments.

This being ill is curious business.

It usually commences in a subtle fashion, almost unconsciously.

Yet if you do not check your illness, it grows and grows.

And one fine day you find you're sick.

* * *

The greatest scavengers of the body are the white corpuscles, or phagocytes in the blood.

These white corpuscles attack and eat up every germ of disease that invades the body.

That is when they are strong enough and in sufficient numbers.

If they're not strong enough, then they wage an unequal warfare until they are finally overcome by their more powerful enemies.

The body becomes steadily sicker and sicker until actual disease sets in.

* * *

Now, we have had all sorts of so-called cures.

And a great many people have seriously endangered their health experimenting with them.

But years ago—before even science was able to tell we had the right treatment for disease—viz., herbs, nature's own remedies.

Now that science can tell to an absolute certainty, we know why certain herbs cure disease.

Because they strengthen and increase the white corpuscles or phagocytes.

A third of a century ago Psychine made remarkable cures.

To-day it is making remarkable cures.

In the interim, millions of bottles of Psychine have been sold.

Hundreds of thousands of people made well and kept well.

Why?

Because Psychine is largely made up of those herbs that scientists now know increase and strengthen the white corpuscles, the phagocytes.

That's why we have received hundreds of thousands of unsolicited testimonials, that's why we can afford to buy and give away hundreds of thousands of 50-cent bottles of Psychine, that's why Psychine benefits these diseases:

La Grippe	Bronchial Coughs
Bronchitis	Weak Lungs
Hemorrhages	Weak Voice
Sore Throat	Spring Weakness
Anaemia	Early Decline
Female Weakness	Catarrhal Affections
Indigestion	Catarrh of Stomach
Poor Appetite	Night Sweats
Chills and Fevers	Obstinate Coughs
Sleeplessness and	Laryngitis and
Nervous Troubles	Dyspepsia

After-effects of Pleurisy, Pneumonia and La Grippe.

Now we don't ask you to take our word for the tremendously beneficial effects of Psychine. Fill out the coupon below, mail it to us and we'll give your druggist an order (for which we pay him the regular retail price) for a 50-cent bottle of Psychine to be given you free of cost.

We will undoubtedly buy and distribute in this manner, hundreds of thousands of these 50-cent bottles of Psychine.

And we do that to show our entire confidence in this wonderful preparation.

A confidence that has been based on our 30 years' experience with this splendid preparation, with a full knowledge of the hundreds of thousands of cures it has made.

COUPON No. 77

To the Dr. T. A. SLOCUM, Ltd.
193-195 Spadina Ave., Toronto

I accept your offer to try a 50c. bottle of Psychine (pronounced Si-keen) at your expense. I have not had a 50c. bottle of Psychine under this plan. Kindly advise my druggist to deliver this bottle to me.

My Name.....

Town.....

Street and Number .....

My Druggist's Name.....

Street and Number .....

This coupon is not good for a 50c. bottle of Psychine if presented to the druggist—it must be sent us—we will then buy the 50c. bottle of Psychine from your druggist and direct him to deliver it to you. This offer may be withdrawn at any time without notice. Send coupon to-day.

Just One Tubular Cream Separator

THE

SHARPLES TUBULAR

Later than, different from, vastly superior to all others. Built on the only known principle of correct separator construction. Free from troubles of common separators. Patented. Has no imitators. Put common separators out of date years ago. In world wide use. Probably replacing more common separators than any one maker of such machines sells.

Sharples Dairy Tubular Cream Separators contain neither disks nor other contraptions, yet produce twice the skimming force, skim faster and twice as clean as others. Make extra profit by saving what others lose. Much easiest to clean. Wear a lifetime.

Waste No Time

on common separators, for they will not satisfy you. You will always remember you might have had a later and a better one, and regret that you did not get a Tubular in the first place.

GUARANTEED FOREVER

by the oldest separator concern on this continent. The manufacture of Tubulars is one of Canada's leading industries.

Facts About the Stomach.

The stomach might be termed a human "barometer." Its functional condition indicates accurately the state of one's health. It is one of the most important organs of the body, for within it originate the greater part of the numerous forms of disease which afflict mankind. The stomach is composed of three layers, the external being compact cellular tissue. The middle layer is formed of muscular fibre, and the interior layer or lining is composed of mucous membrane. The organ has a soft, spongy appearance, and when not distended lies in folds.

From a physiological standpoint the stomach may be considered as a hollow muscle, capable of holding from one to two quarts. At the lower end of the organ is a narrow orifice in which the circular muscular fibres are much thicker. The food enters the stomach from the upper orifice, aod is discharged from the lower opening. It was at one time suppose that digestion was begun and practically completed in the stomach, though it is now known that it is but one of a series or organs engaged in the very important process of preparing the food for assimilation. As a matter of fact, the process of digestion really begins in the mouth, and only ends when the waste portions of food are actugily ejected from the body. The fact that the stomach is more liable to disease than any of its fellow organs is principally due to its construction, which is more or less of an elaborate nature, and of diet errors which civilized humanity is habitually making.—Bernarr Mgcfadden.

A White Bedroom.

Nothing is prettier or more dainty than an all-in-white bedroom It is not practical if the room is af that convertible type used as sitting-room and sleeping apartment alternately; but when the little room is used to sleep in only, or perchance as a dressing-room, there is no more perfect scheme than white furnishings.

Cottage furniture has returned to favor and a white enameled bed will look well with a bureau and washstand that have been retouched with wood enamel in white, says the Sterling Standard. The woodwork may be whitened, even if it first required the application of a paint remover and the work that entails.

Curtaining and wall paper will present no difficulty, since dealers can supply both plain and glossy white papers, and the qualities of Swiss for sash curtains are practically numberless. That paper having a satiny surface or an invisible pattern will prove less monotonous; the drapery of the bureau should harmonize with the curtains.

Art and the Home

If there is one gift that comes more directly from heaven than any other womanly attribute, it is the instinct for making a home; first in the inner, finer qualities, the sense of peace and fulness and order that should prevail in every household; next in the framing of these virtues, their harmonious expression in outward and visible signs. For a house may be beautiful, spacious, stately, yet remain but a carven chalice, unfilled by the wine of life.

It does not follow that the small house is necessarily invested with this divine quality; her inconvenience may quarrel at every corner with ugliness, redeemed by none of the warming fires of sincerity and good cheer. But of the two problems, it is the easier to solve, because, for some strange and unaccountable reason, it is given to the elected only to blend with large beauty the charm and comfort of reminiscent homeliness. A house, a home, should have a rested, lived-in-book, the sense of toys played with and put by, the glimpse of happy, human, peaceful joys.

What wonderful quality is there about a glowing lamp or the cheerful flap of a red table-cloth on a back-yard clothes line that can belittle mere beauty into a thing of far less worth? The much-abused mid-Victorian period with all its oversensibility and decorum, had, nevertheless, a surer grasp of the fitness of things. Nowadays most rooms gave the air of being planned by people who never expected to live in them, and one has seen their pictured furnishings standing in rectangular aloofness, all completely alike in spirit; that at last the fastidious observer is tempted to parody Kipling's verses, and demand "It's art, but is it a home?"

A Product of Brains For Men of Brains

THE keen, quick, business-like directness of the GILLETTE appeals to the man who knows and appreciates a time-saving tool or a clever piece of machinery when he sees it.

With the GILLETTE there's no time wasted in honing, stropping or fussing with a complicated shaving device. You simply pick up the GILLETTE—and *shave.*

And such a shave!

The GILLETTE blade, thin enough to take a perfect temper, yet held absolutely rigid in the handy GILLETTE frame, and adjustable to any beard, shaves as no other razor *can* shave.

The GILLETTE changes shaving from a time-consuming ordeal, to be endured as seldom as decency will permit, to a pleasant three-minute incident in the toilet. It enables a man to always look and feel his best—and yet preserve his face and temper.

Standard Sets $5. Pocket Editions $5. to $6.
Combination Sets $6.50 to $25.

At Hardware, Drug and Jewelry Stores. Look for the big GILLETTE Signs—they show you where to buy.

KNOWN THE WORLD OVER

The Appendicitis Bugaboo.

When my little boy was a year old he suffered from malnutrition, because he had been nursed by a mother who had simply lived on white bread, and was all but a nervous wreck in consquence; and we took the boy to a specialist in children's diseases, who laid out a menu for him. He had to be fed eight times a day, and the injunction which was laid upon my wife that the stewed prunes that were fed him should have every particle of skins removed. And I recall the fidelity with which we carried out this order, shuddering meantime at the thought of the frightful destruction that would be wrought to the precious infantile insides by those paper-like prune skins. I wonder what that doctor would say if he were to see the boy now—rosy and sound in spite of all the pneumonia and bronchitis and croup brought on by that regimen of stuffing—and eating three times a day a plateful of wheat-hulls and nuts, and raw raisins with the seeds.

I used to have an idea that these rough things would perhaps tear the intestinal walls; I had an image of them somehow scraping the skin off. Since that time, however, I have passed several gallons of sand through my system, and countless bushels of wheat hulls and raisin seeds and date pits and orange peel-

ings; and so I have a new conception of the toughness of the inner tract.—Upton Sinclair.

Household Hints.

It is sametimes necessary to set a table for an extra large number of persons when the usual cloth three or three and a half yards long will not cover the table. When buying smallt ablecloths it is a good plan to buy two alike so that when the table is extended the two can be used together making an extra long cloth.

When putting the wringer away, loosen the screws that tighten the rubber rollers. It saves the rubber Be sure the wringer is dry.

Keep all food or groceries in jars or cans and there will be less trouble with mice.

Cheesecloth makes good dust cloths It will not scratch the furniture. When soiled it can easily be washed and a fresh dust cloth is at hand.

A piece of salt pork is a good thing to use in greasing griddles. Have it thick and fat and it can be used for this purpose.

How a Farmers Wife Made it.

As the ordinary resources of the farm, eggs and butter, are all shipped, and the proceeds added to the general fund, I could not count upon them for spending money. My mind turned to my former occupation—teaching. I soon found a number of backward pupils that needed a tutor—a "commodity" seldom found in the country. Other parents gladly gave me twenty-five cents an evening for two sessions a week. I usually had some little treat for the pupils when study was over.

Teaching brought me in from two to three dollars a week. This of course was not possible at all times of the year, but, if there is not one way, there is another. Soon I found I could readily sell all the delicious maple-candy I could get to make, and at a good prices; then when I feel the desire for fancy-work I turn to my old, ever popular standby, "Irish point." An exchange in a near by city takes all I can make at fancy prices.

Extra fruit that is too abundant to sell well I make into jellies, preserves and pickles; also can rhubarb, water, which is clear gain, and sells well.

All these I keep till January or February, when other fruit is scarce. I sometimes realize as much as thirty dollars from these extras. Sending cowslips, dandelions, watercress, sweet peas, nasturtiums to the city market is often profitable.

I am inclined to be a little selfish about spending my earnings, but as Christmas has always had its terrors for me, if short of funds, I have found it a pleasure to use some of my hard earned dollars at that time. I love pretty things, and can satisfy my love of the beautiful and purchase rare flowers, beautiful china new music and books, or attend a good play. There is one other pleasure best of all, and that is in doing a little good with the money you have earned, to some one not so fortunate as yourself. You feel twice as happy. Try it.

Oh! There are many ways for a farmer's wife, even, to make and spend pin money.

Weak Men, Read

Perfect health and strength denote the absence of disease. When you are weak it means that you lack that which is the foundation of strength—of life itself—Electricity. You may be afflicted with Rheumatism, Dyspepsia, Lame Back, Weak Kidneys, Nervous Debility, Sciatica, Constipation or any of the numerous diseases which lead to an early breaking down of the system. If you have any of these troubles they should be attended to at once. You have tried drugs, and found that if they even stimulated you they did not cure, but left you with some new trouble as a result of the poison put into your system.

It is pitiable to think of the vast number of men who go on from day to day suffering mental and physicial torture as a result of their weakness, while right at their doors other men are being cured of the same disease. One who has not known it himself cannot realize the feelings of a man in an advanced stage of Nervous Debility, nor does he hear it, for these men do not talk of their troubles. Even when they are fortunately led to use the remedy which is now so well known—Dr. McLaughlin's Electric Belt—and are cured by it, they do not mention it to their closest friends; hence the prevalence of this trouble, and the means of cure are appreciated only by those who have had experience. And yet I have thousands upon thousands of grateful patients who are willing to testify to their cures by

Dr. McLaughlin's Electric Belt

and who would be glad to share their knowledge with others if writtten to. I send the names of these men to any one who requests them. There is not another remedy in the world to-day that has proven as effective. Its cures speak volumes for the good work it has accomplished. My confidence in my method enables me to offer to any man or woman who will offer me reasonable security to use the Belt at my risk and

PAY WHEN CURED

If I don't cure you my Belt comes back to me, and we quit friends. You are out the time you spend on it—wearing it while you sleep—nothing more.

Dear Sir,—I have used your Belt since last November, and I feel much better. The emissions have stopped entirely. I am well pleased with the Belt. It has proved all you claimed for it.

Yours respectfully, Daniel Chatterton,
Cobalt, Ont.

Dear Sir,—I am glad to say that your Belt has made a permanent cure of my case. After using the Belt and following directions for three months I felt like a new man, and have not used it since. As it is now over eighteen months since I stopped using the Belt, and have had no return of my trouble, I find I am cured, and words cannot express the gratefulness I have towards you and what your Belt has done for me. Before using your Belt I weighed 140 and now I go 170. I am recommending your Belt to all my friends. I remain, yours truly,

Leon Rolfe,
Lime Ridge, Quebec.

Dear Sir,—I have worn my Belt for a month, and I am well pleased with the results. I feel better in every way; have a good appetite, and my food digests well. Yours very truly,

Ira S. Acker,
Birchtown, N.S.

Dear Sir, I have worn your Belt for a month now, and I am glad to say that I have received the greatest benefits from it. My back is a great deal stronger, and the pain in my legs and arms have gone and I am feeling like a new man already. You may use this letter in an yway you wish. Wishing you every success, I remain, Yours truly,

William McConnell,
Bon Acord, Vic. Co., N.B.

I cannot take up more space with those extracts. But if you will send me your address I will mail you free my beautifully illustrated book, along with testimonials from thousands of grateful people, who have been fully restored to health and strength.

This appliance has cures in almost every twon and city in the country, and if you will write me I will send you testimonials given to me by people that are probably well known to you. My Belt not only cures weakness, but Rheumatism, Sciatica, Lumbago, Backache, Kidney Trouble, Nervousness, Constipation, Indigestion and Stomach Trouble. I have a beautiful 80-page illustrated book, which I will mail, sealed, to any address, FREE. This book is full of lots of good, interesting reading for men. Call today. If you can't call, send coupon for Free Book.

150 Favorite Old-Time Songs

With Words and Music Complete for

15 Cents

This is a splendid collection of old-time songs and ballads—songs that touch the heart and recall the tenderest memories, many of them having been popular favorites for forty or fifty years and just as dearly loved to-day as when they were written. Each song is published in this book with both words and music complete and we question if there has ever been issued a collection aiming so large a collection of sterling favorites at so low a price. We will send this book postpaid to any address on receipt of 15 cents.

REMARKABLE OFFER

We issue a special line of popular priced novels by such famous authors as Conan Doyle, Mrs. Southworth, "The Duchess," Alexander Dumas, etc., etc. Send us fifty cents for a trial order of a dozen books and we will include the Song Book free of charge. This offer is for a limited time only. Address all orders: THE WHOLESALE BOOK CO., Dept. 11, Winnipeg, Canada

The Experience of a Farmer's Wife.

Editor Maritime Farmer:—

When I became a farmer's wife thirty years ago, conditions were not by any means what they are to-day. Little do the young men and women realize now, what their fathers and mothers endured to make a home. Many of us started life in new settlements without the advantages that would seem really necessary; and yet it is wonderful how we managed without being uncomfortable or distressed. At our present rate of living it hardly seems possible that we could have been happy with such meagre surroundings. But when hearts are young and arms brawny with health as our motor-power, all difficulties are easily overcome. At that period most of us started housekeeping with bare floors bare walls and just enough of the necessaries to get along with. Then our floor coverings consisted of the rag mats we were able to make from the cast off clothing, and many of us recall the pleasant afternoons spent with neighbors at a mat-hooking—one of the social events of the times.

Then there was the home-made carpet, for was it not the pride of every thrifty housewife to make her home as comfortable and cozy as possible. Many could spin their warps, color it, and weave their own carpets. I could spin but not weave, so gave my neighbor's daughter music lessons in remuneration for weaving. Many an evening have I sewed carpet rags when I ought to have been in bed sleeping, still I felt the pleasure of labor rewarded when it shaped into nice bright coverings for our rooms.

How different today. Go into most any farm house and you find nice an wool, Brussels, and sometimes Axminister carpets, with everything else to correspond. Comfort is stamped on every room. Instead of having to work up the fleece of sheep it can now be exchanged for anything you want. Just think of the labor saved in this particular, for in those days I am sure farmer's wives worked four times as hard as they do now, with no time for rest, study or self-improvement.

Then the old way of caring for the milk has gone for good and always. Think of washing and scalding fifteen or twenty pans and putting them out to sun, twice a day. Such a mussy, sloppy job. Now we have the separator, the men milk and separate it, and in a few minutes everything is cleaned up. There was also the old dash churn, which has been split up for kindling wood long ago—and none too soon, for of all the tiresome things, that was the worst.

I remember well when we had illness in our family, the father had to drive fifteen miles for a doctor, through roads that were almost impassible. When he arrived at the doctor's residence, found that he had gone on a long journey and would not be back until midnight. Thus nearly twenty-four hours elapsed before he arrived, too late, at the bedside of the patient. During that time what the patient suffered, can never be told (neither can my anguish of soul) for with the dawn of day, the fettered spirit took flight to a better land. Now we step to our telephone and cover the distance in a few minutes. If one doctor is absent we are able to call another. Of all modern conveniences, I believe the chief in importance is the telephone. It has been a wonderful factor in lessening the feeling of isolation, incedental to country life and is really a necessity in every home. How often we call our friends miles away, and have a little chat, when a visit would be out of the question.

Years ago one mail g week in most places was all we could have. How eagerly we watched for that one newspaper, or a letter from some friendd, who perhaps, was in trouble, and our only way of hearing was by the weekly mail. Now we have daily mails most everywhere, and newspapers and magazines so cheap that the poorest may keep in touch with the current events of the world. I must not forget to mention the schools. Though we had a free school law, it was not in the working order that it is at the present and our teachers were not nearly so well educated; however, they managed all right, because children in those days were not advanced, as they are now. These are only a very few of the improvements I could enumerated until you were tired of reading.

I can look back over my life, and see where energy, strength and ambition were called into action that the farmer's wife of today has no need of. It is her reserve fund and keeps her fresh and young. Years of toil and thrift have been rewarded and an up-to-date home with all the conveniences a farmer should have is mine. I often look back to the make shifts we had to plan with some

BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

amusement and think how true is the old saying "necessity is the mother of invention." I have no regrets for the past. I chose my course, shouldered my responsibilities made the most of my advantages and found pleasure in work and duty. To the younger generation starting in life all these difficulties are swept away. Now the farmer's wife has her horse and carriage to drive where she pleases and modern conveniences lighten labor so that she has time for social and self-improvement. I should like to say to the young ladies, if some nice young farmer, with all the manly attributes, seeks your hand in marriage, do not be afraid to trust him, for with conditions as favorable as we have them today, who can, if they have to work for a living, be more comfortable than a farmer's wife.

FARMER'S WIFE.
Andover, N. B.

Tell Her So.

A Farmer's Adbice to His Son Who Had Just Married.

Amid the cares of married life
And all the trials of business strife,
If you love your trusting wife,
Tell her so.

Prove to her you don't forget
The bond to which the seal is set,
Of all your bliss, she's the sweetest yet,
Tell her so.

When days are dark and deeply blue,
She'll bear your sorrows same as you
Prove to her your love is true,
Tell her so.

There was a time it gave you bliss
To have the favor of one kiss,
A hundred now won't come amiss,
Tell her so.

In her your future is at stake,
And dark the day that it should break,
Don't conceal it, for her sake,
Tell her so.

Don't think when she has passed her prime,
An act of kindness would be a crime.
If ever you loved her, now's the time,
Tell her so.

She will return for each caress
An hundredfold of tenderness,
Jewels like her were made to bless,
Tell her so.

When you know she's all your own,
And you are her's and her's alone,
Don't wait to carve it on a stone,
Tell her so.

Never let her heart grow old,
A thousand beauties will unfold,
For she is worth her weight in gold,
Tell her so.

If this advice should prove untrue,
And give no joy to either of you,
When life's battles are all through,
Tell me so.

W. H. Kuykendall, Tuxpam, Mexico.

"Do you think, sir," asked the waiter, helping the guest on with his coat, "that lightning ever strikes twice in the same place?"

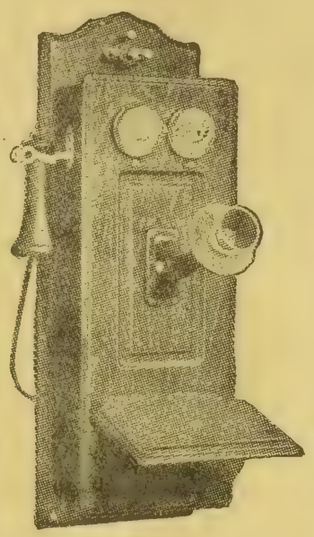
"Yes, I guess it does," answered the departing [illegible]

"Well, sir—the gentleman who sat at this table before you came in gave me a 50-cent tip, sir."

"Ah, indeed. And you think there may be a chance that he'd come back to-morrow? I doubt it. Good night!"

Rube—Where's yer boy, naow?
Josh—He's in New York.
Rube—Which side's he on, by this time)

Get Our Prices on Telephone Equipment.



In our factory in Toronto we have the facilities and the skilled labor required to produce the very best telephones and equipment. It is our determination to make telephones above the average. We have set a high standard of quality for our goods.

But what may interest you even more than the quality of our goods are our prices. They are very, very reasonable, as we will prove when you ask for quotations.

And so sure are we of the superiority of our telephones that we will send two or three for free trial, so you can compare them with others. All our materials are sold on honor, and each telephone carries with it a 10 years' guarantee against defective material or workmanship.

Get our No. 1 Bulletin, which gives complete information about up-to-date telephones and switchboards. No. 2 Bulletin is for those who desire information on the building and operating of rural telephone lines. Either Bulletin, or both, will be mailed free on request.

If You Have a Friend Worth Loving

If you have a friend worth loving,
Love him. Yes, and let him know
That you love him, ere life's evening
Tinge his brow with sunset glow.
Why should good words ne'er be said
Of a friend—till he is dead?

If you hear a song that thrills you
Sung by any child of song,
Praise it. Do not let the singer
Wait deserved praise long.
Why should one who thrills your heart
Lack the joy you may impart?

If you hear a prayer that moves you
By its humble pleading tone,
Join it. Do not let the seeker
Bow before its God alone.
Why should not your brother share
The strength of "two or three" in prayer?

If you see the hot tears falling
From a brother's weeping eyes,
Share them. And by kindly sharing
Own our kinship in the skies.
Why should anyone be glad
When a brother's heart is sad?

If a silvery laugh goes rippling
Through the sunshine on his face,
Share it. 'Tis the wise man's saying—
For both grief and joy a place.
There's health and gladness in the mirth,
In which an honest laugh has birth.

If your work is made more easy
By a friendly, helping hand,
Say so. Speak out brave and truly
'Ere the darkness veil the land.
Should a brother workman dear,
Falter for a word of cheer?

Scatter thus your seeds of kindness
All enriching as you go—
Leave them. Trust the Harvest Giver
He will make each seed to grow.
So, until the happy end,
Your life shall never lack a friend.
—Author Unknown.

Bathing and Health.

It might be said that the power and strength of a nation or a person may be measured by its or his regard for the bath. History furnishes emphatic illustrations of his fact. When Egypt, Greece and Rome were at the height of their ancient power, their citizens made bathing a social function, a municipal duty and a religious observance. The public baths of these nations were magnificent architecturally and important as centres of hygienic and municipal sentiment. With the decadence of these countries, the world seems to have reverted to a period of mental sloth and physical uncleanliness.

As an authority on the matter puts it: "For a thousand years, there was not a man or woman in Europe that ever took a bath, if the historian of these times, Michelet, is to be believed. The ancient love of the bath seemed to have disappeared from off the land. There was no Greece or Rome to hold up the ensign of cleanliness to the nations of Europe. Small wonder that the peoples of the Continent became physical decadents, as indeed they were in spite of tradition to the contrary. It is not strange that there came the awful epidemics that out of on?-fourth of the population of Europe—the spotted plague; the black death; the sweating sickness and the terrible mental epidemics that followed in their train— the dancing mania; the mewing mania and the biting mania. Not only the houses, but the persons of all classes reeked with filth and vermin. The bath was banished and filth was almost deified. Indeed, it was then thought that the sanctification of the body was only accomplished when that body was indescribably dirty—From July Physical Culture.

Kingston, Ont.

Full line of veternary remedies in stock includ ing Dr. Fells Wonder, Fine Blister for Spavins, Ring bones, Lumps or Bunches of any kind.

A sprained ankle will usually disable the injured person for three or four weeks. This is due to lack of proper treatment. When Chamberlain's Liniment is applied a cure may be effected in three or four days. This liniment is one of the best and most remarkable preparations in use. Sold by all dealers.

Several Cooking Economies.

If apples are placed for a few minutes in boiling water before paring, a much thinner peeling may be taken, thereby saving much of the apple.

Many cooks do not know that corn starch is an excellent substitute for eggs, particularly in doughnuts and cookies. One tablespaonful of cornstarch is equal to one egg.

If your vegetables become frozen, place them in cold water while they are still at their coldest, and they will usually be restored to perfect condition in an hour or so.

To Save the Yolks of Eggs.—The whites of eggs are frequently needed, and not the yolks. Do not throw the yolks away, but to preserve them slip them unbroken into a deep narrow dish, and pour gently over them a covering of cold water. Set them in a cool place, and they will remain fresh for several days. When the whites of eggs are left over, they can not be kept at their best for more than a day or two, but if they are to used for cake in which soda is an ingredient, a little fresh milk may be gently turned down over them, the same to be used when they are.

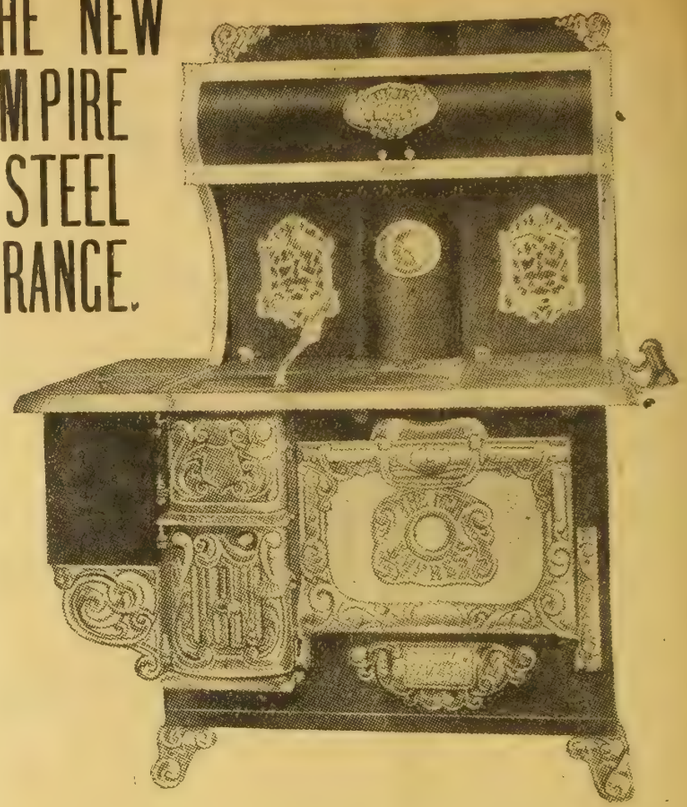
Do not throw away left-over potatoes, stale cake, stale bread, crusts or "heels" from the bread loaf, meat of fowls, codfish and the like. Here are several receipts which will make deliciaus dishes from "left-overs."

Potato Salad.—Slice cold boiled potatoes with alternate layers of finely sliced onions. One onion to six large potatoes would be about right. Put a few small pieces of butter, over the top. Season with salt and pepper and pour over all a cupful of cream, with just enough vinegar in it to suit the taste. Heat all together; let it simmer slowly until the onions are soft. It can be eaten hot or cold as preferred.

Creamed Baked Potatoes.—Make a sauce of one tablespoonful of butter, one half-pint of milk, one tablespoon ful of flour, one-quarter teaspoonful of salt. Rub the butter and flour together until smooth, and add it to the milk when boiling. When creamy add the salt. Cut cold boiled potatoes into small blocks, place them in a baking dish, pour the cream sauce over them. Sprinkle over the top a thin layer of breadcrumbs and bake until brown.

A very satifactory way to clean white marabou feathers is as follows: Dissolve a tablespoon of washing powder in a pint of boiling water and let it partly cool; then, holding the bunch of feathers by the stems, swish them through the suds for a few minutes. Do not rub or squeeze. Rinse in the same manner. Dry the feathers in the open air or in a warm place indoors. They will fluff out like new feathers.
E. F. P.

THE NEW EMPIRE STEEL RANGE.



The phenomenal sale of this Range in the Maritime Provinces is the best proof of its superiority over other makes. The owner of a NEW EMPRESS does not hesitate to recommend it to their friends or neighbors. Hence the result.

The large roomy 20-inch oven; the splendid heavily lined firebox (changed to burn wood or coal by a simple turn of the shaker crank) which takes a stick of wood 27 inches long when equipped for burning wood; the large working top; the tight fitting roomy warming closet and the left hand copper reservoir, holding 36 imperial quarts with the firebox between the oven and water are some of the features of this Range.

The EMPRESS is a splendid baker and the top being of a special cast will furnish plenty of heat—being superior in this respect to other Ranges with malleable tops.

Write us for Catalogue and let us tell you about our "Easy Payment" purchase plan. Address nearest branch.

FELT FOOT WEAR

Your Feet Can't Get Cold When You Wear

KIMMEL Felt Footwear

Take a ten mile walk—or a twenty mile drive—with the thermometer 40 below zero—and your feet will be warm and comfortable if you wear Kimmel Felts.

See that trade-mark as shown above appears on each sole. Ask your dealer to show you Kimmel Felts. 55

Silence and Home Life.

There is one thing that is conducive to peace and harmony in ome life, and that is, silence. In the best regulated homes there is a certain amount of friction, especially if strong individuality. The member all the members of the family have a of the family who cultivates the habit of remaining silent when there is real or imaginary provocation or "saying things" has an advantage.

Silence has two advantages; it gives a certain amount of temperamental strength to the one who does not speak, and no one's feelings are hurt. The quiet, self-contained woman is the type that most people appreciate and respect.

There is another advantage in silence. There is no greater mistake than ta discuss wrongs and grievances real or imaginary, in family life, or as an individual, especially ially at the table. A certain amount of talk is necessary, but when a thing is once settled, it is better to let the subject drop.

The place to cultivate virtues is not in the community or the outside world, but it is in the home circle. A. B. M.

Pineapple Vinegar.

Shred three ripe pineapples after they areprepared and eyes removed. Cover with pure cider vinegar and let them stand for three or four days. Then squeeze through a cloth and strain as long as the juice runs clear. Measure the juice, and to each quart allow two-thirds of a pound of cane sugar. Boil together ten minutes and skim until the scum ceases to rise to the surface. Then take the syrup from the fire and let it cool slightly before bottling and sealing.

A tablespoonful of this vinegar in a glass of shaved ice or ice water will prove delightfully refreshing on a hot day.

The Damage A Moth Does.

It is a mistake to suppose that keeping out the air is a safeguard for furs. Far better is it to take out the furs once a fortnight and look them over, if they are not kept in cold storage. In so short a time as a fortnight an ordinary moth can work irretrievable damage.

Cleanliness is the saving grace of furs, and the housewife who cannot afford the care of experts should pack her furs where they are accessible, clean them thoroughly and examine them at regular intervals.

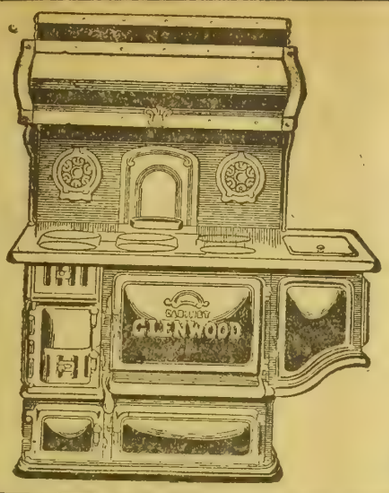
Care of Lamps

As there are so many more homes in which the inmates depend upon paraffin lamps for their nightly cheer than upon gas, a few suggestions on the care of lamps may not come amiss. There is no necessity for sitting beside a sputtering, flickering lamp, with a smoked chimney, in gloom and half obscurity, if we only lamps. To ensure a clear mellow understood the management of our light the brass of our lamp burners must be kept perfectly free from the smutch and stain. An old blackened burner, is however, hard to be cleaned. It is a good plan to boil them in strong soapsuds, and if this does not brighten them, to scour them with brick dust, polishing off with whiting or soada.

Never cut your wicks by turning it just above the tube, but take the stub of a match and rub off the char red wick. By this method you will ensure an even flame. When the flame runs up to the chimney of the lamp it is an indication that the screw of the burner is worn out; it is unsafe. Cast it aside and buy a new one. Empty your lamps occasionally, and wash the inside with suds, care being taken that they are well dried before refilling them. Do not wash flint-glass chimneys too often in soapsuds, as it has a tendency to make them brittle but rub them out with a piece of clean flannel. Lamps thus managed will give a brilliant light, and amply repay one for their trouble.

For a finger nail that was badly pinched my physician told me to apply cold water and to hold the finger upright for at least half an hour not letting it hang down for a second. Since using this remedy I have never had a black spot on the nail no matter how badly the finger may throb and ache. E. M. H.

Picture hung by a single wire have an annoying way of geteing uneven, on account of the slipping of the wire on the picture hook. This can sometimes be avoided by hanging the picture face to the wall, then turning it around. The single turn this makes in the wire near the hook prevents slipping. N. H. L.



A Glenwood Range Would Make a Most Useful Christmas Present for Your Home.

Now is the time to think of what you need most in your home that would make a good Christmas present. One that every one would enjoy and that would always be remembered by the household in general. What would be more useful to every body than a Glenwood Range? Why it would make mother's labors light and she would have your meals cooked right. Father and brother would have more time as they would not have to saw so much wood, for Glenwood Ranges are saving on fuel. Sister would be so delighted with the qualities of the Glenwood Range, she would always be getting up some dainty dish that would be pleasing to the taste, and every body in the house would be happy.

Send for catalogue and prices and have one shipped to your home in time for Xmas. We pay the freight. All Glenwood Ranges made in St. John.

McLEAN-HOLT & CO., 155 Union St., St. John, N. B.

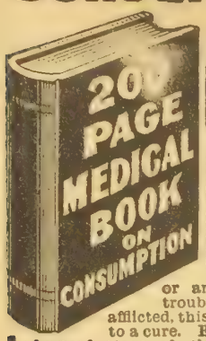
Consumption Book FREE



This valuable medical book tells in plain, simple language how Consumption can be cured in your own home. If you know of any one suffering from Consumption, Catarrh, Bronchitis, Asthma or any throat or lung trouble, or are yourself afflicted, this book will help you to a cure. Even if you are in the advanced stage of the disease and feel there is no hope, this book will show you how others have cured themselves after all remedies they had tried failed, and they believed their case hopeless.

Write at once to the Yonkerman Consumption Remedy Co., 1622 Rose Street, Kalamazoo, Mich., and they will send you from their Canadian Depot the book and a generous supply of the New Treatment, absolutely free, for they want every sufferer to have this wonderful cure before it is too late. Don't wait — write today. **It may mean the saving of your life.**

WASH THE ITCH AWAY.

It is said that there are certain springs in Europe that give relief and cure to Eczema and other skin diseases. If you knew that by washing in these waters you could be relieved from that awful itch, wouldn't you make an effort to take a trip to Europe at once? Would you not be willing to spend your last cent to find the cure?

But you need not leave home for these distant springs. Relief is right here in your own home town!

A simple wash of Oil of Wintergreen, Thymol and other ingredients as compounded only in D. D. D. Prescription will bring instant relief to that terrible burning itch and leave the skin as smooth and healthy as that of a child.

If you have not already tried it, write the D. D. D. Laboratories, Dept. F. M., 49 Colborne St., Toronto, for a free trial bottle, and prove its wonderful affectiveness. We assure you of instant relief.

For sale by all druggists.

The St. John Business College

S. Kerr, Principal.

FLORICULTURE.

H. S. J. wants to know if we would advise planting three small palms in one pot, in order to make a bushy plant. Do they do well? In what size pot would three plants of the Kentia variety have to be put—the plant being about three feet high and in five inch pots with about four leaves each. Is Rudbrickia and the yellow Goldenglow the same thing?

You could pot the three palms in an eight inch pot if you carefully removed the superfluous soil and if the roots are very carefully handled you should have a good healthy pot of palms. I do not like to have palms as large as those you mention to make up. One about two feet high and three small ones out of a three inch pot make a much prettier effect as three plants of the same height are rather bunchy.

Now cover the blub beds with manure and place over this a layer of spruce brush also cover all roses with brush placing the boughs thickly both under and over the bush so as to provide both a support and protective covering during the winter.

I must again call the attention of anyone who has an unsightly wall or side of building, fences, etc., that they desire to cover during the summer with green vines, to that old fashioned vine, the Echinocystus Lobala. It is nothing new and in many places very common going under the name of Wild Cucumber and Balloon Vine, neither of which it really is, but for rapid growth, beauty of foliage and bloom, it is unrivalled in this country The seed should be planted in the fall or if scattered on the frozen ground even, they will grow. They require rich soil to develop to perfection. The seeds are cheap and easily obtained.

Clean up all the old dead annuals, leaves and rubbish from around beds shrubs or borders and burn them. You will thus destroy thousands of injurious insects that depend on this rubbish for protection during the winter. A light mulch of clean, strong manure or brush is the best winter protection for stock remaining in the ground but neither should be applied until the ground begins to freeze.

Many plant growers complain that their plants grow spindly, even if in bright sunny windows. The trouble is that the curtains are down at the top shutting off the top light, that they crave even more than the sun from the side angle.

For Easter Lilys count six weeks from the time the buds show. Spiera for Easter should be well budded now. Do not fumigate this plant as it is almost sure to injure the foliage. Keep them away from plants that are infested. Eight weeks from sprouting to flower is the commomly accepted rule among florists. They should be dug before the ground freezes and kept in a cool place until ready to force.

Inquirer,asks when Tulips and Daffodil bulbs should be planted in the garden and also what the Burbank Shasta Daisy looks like?

Tulips, Hyacinths, Narcissus and such bulbs should be planted in the ground between the 20th of September and the 1st of November, early in October being preferable. The Shasta Daisy is simply a mammoth form of our common daisy or bull's eye. It is, however, more than twice as large and just as hardy.

Chatham wants to know what to do to save a large plant of Asparagus Sprengeri that is losing all its foliage? The new vines seem to be growing all right but the old vines are shedding all their leaves. Itis in a large pot and the roots are comiog out of the drainage. What is the best hardy lily for the garden, that is, outside of the common yellow and red varieties.

By all means repot the plant at once. This will overcome this difficulty with the foliage in a short time but you should not allow this plant to become so thoroughly potbound again. For a hardy lily try the Lilum Auratum or Golden Banded Lily of Japan. It is a beautiful flower and winters well if proteced thoroughly in the fall. The list of lilies that are perfectly hardy in this climate, is apparently very limited, at least, in this section of the province.

Plant lilac hedges in October.

Mrs. D. G., St. John, writes: When should my Calla bulbs be started into growth? I have a fine Agapanthus Blue. I am told it should be rested for a season. When should this be done? Please tell me the name of the Begonia leaf enclosed.

Start the Calla bulbs by repotting and watering about the middle of September, and about the same time start to dry off the Agapanthus; this should be gradually done as they usually have quite a lot of foliage.

Palm, Chatham, writes: I have a Palm which has all the year looked very healthy and been much admired; but during the last week I noticed when I watered it, myriads of tiny white insects or maggots came to the surface. I am afraid to use ammonia or anything without consulting you. Kindly advise me.

You plant should have a good soaking with lime water, which can be purchased from your druggist or yau can make it yourself by using a piece of quick lime as large as a hen's egg to a pail of water giving lowing it to settle and using the clear liquor after settling. Water twice a week for two weeks giving the soil a good soaking. About two hours after the time the water is used soak again thoroughly with clear water to remove surplus of lime.

H. S. P.—Should Gladioli bulbs be kept in wet sand during the winter, also should the leaves be cut off or allowed to dry up on the bulb? Is it a good time to repot a sword fern now?

It is not necessary to use dry sand to keep these bulbs during the winter. When dug from the ground the top should be cut off about two inches from the bulb. The bulbs are then spread on paper to dry, but not in the sun. When quite dry they can be placed loosely in a flat box, kept uncovered and stored in a cool dark place free from excessive dampness or drough—a clothes press is generally a good place. As soon as the leaves of a fern yellows, one should turn it out of the little pot and see if it is full of little roots, then it needs repotting.

The peculiar properties of Chamberlain's Cough Remedy have been thoroughly tested during epidemics of influenza, and when it was taken in time we have not heard of a single case af pneumonia. Sold by all dealers.

Clean Your Seed

Separate and grade ALL kinds of seeds—eliminate ALL weed seed, shrunken grains, broken particles and dust. You can do it easily, quickly, thoroughly with the Chatham Fanning Mill and insure

PFRFECT MAPLE EVAPORATOR

A first-class maple evaporator that will make **good clear**—the kind you like—syrup, with a **very small** quantity of fuel. Price **so low** that the poorest man can buy.

Every one GUARANTEED—if not as represented **fire it back** at our expense. Sold direct to the farmer. Turns that sugar bush of yours into a paying business. Don't take our word for it. Send for our new pamphlet. It tells what the fellow who has used it thinks.

THE STEEL TROUGH & MACHINE CO, No. 7 James St., Tweed, Ont.

Ice Necessary on the Farm.

(Continued from page 239.)

temperature of the milk to 73 degrees (90 plus 56 divided by 2 equal 73). In practice, however, the actual cooling would be less, because the water will absorb heat from the air in the meantime. Even if the water is changed after the first supply has lost its cooling power, the very best that could be expected after one change, would be to bring the milk down to about 64 degreees. A temperature of 64 degrees is not low enough for preserving Saturday night's or Sunday morning's milk.

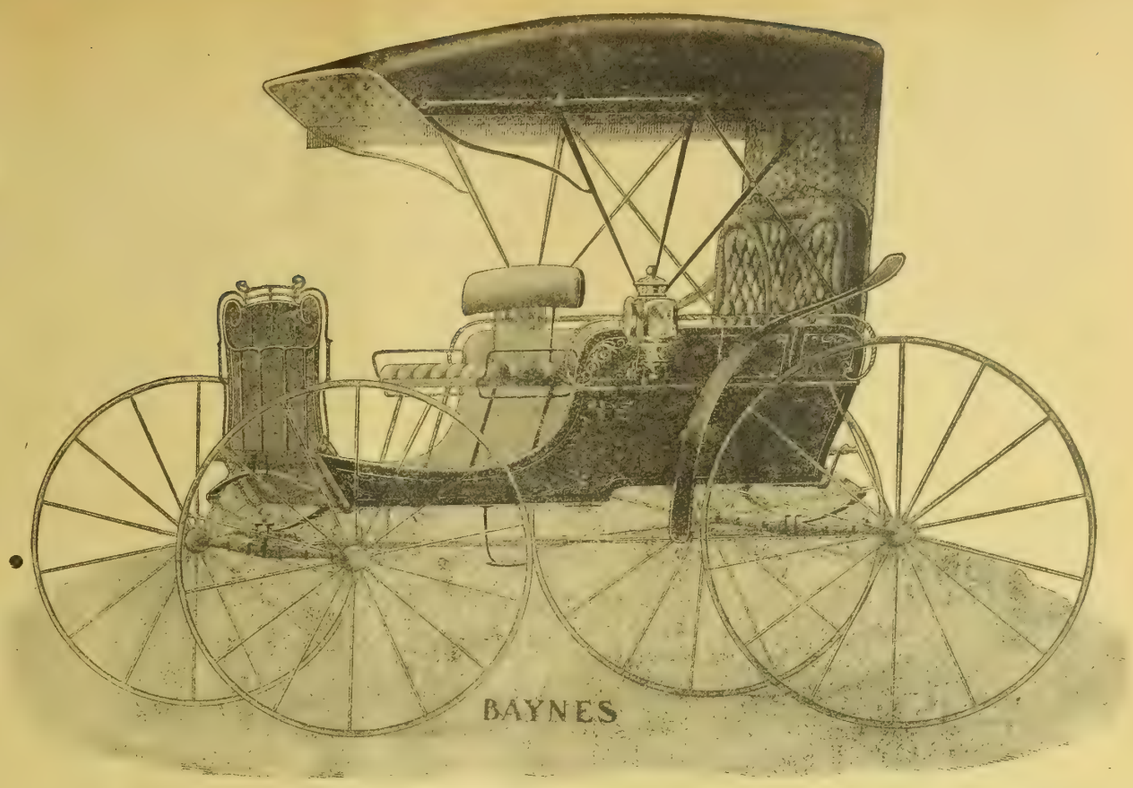
Roughly speaking, ten pounds of ice are equal in cooling power to 100 lbs. of cold water. Thus 10 lbs. of water containing ten pounds of ice will do as much cooling as 200 lbs. of the same water. Or, in other words, the use of ice in the water surrounding the milk may do away with the necessity for changing it. The same advantage applies in the case of using a special milk cooler. The ice can be placed in the receptacle which contains the supply of water for the cooler.

But the most important advantage in the use of ice arises from the fact that by its use the temperature of the milk can be reduced to and maintained, at a lower point than is possible with the use of water alone; and a low temperature is absolutely necessary for preserving milk for lengthy periods. The temperature should be reduced to 50 degrees and maintained at that temperature when milk is to be kept from Saturday night or Sunday morning till the following Monday morning.

To utilize the ice for household purposes in connection with an arrangement of this kind it would be necessary to provide an insulated ice box in which to put articles of food along with a quantity of ice from time to time. A simple arrangement which will give satisfaction, is to make a box in shape of a trunk or chest lined with galvanized iron, and divided in the center by a partition open at the top and bottom to allow for circulation of air between the two compartments. The ice can be placed in one side of the partition and articles of food on the other side. A box constructed as follows will give good satisfaction: One layer of matched boards covered with one inch of hair felt and finished with another layer of inch-boards. That is to say, the sides, top and bottom will consist of two ply of matched boards with one layer of one inch hair felt between. The cover should fit tightly and be provided with a cushion of some kind to make it airtight. The galvanized iron lining is necessary to prevent the dampness from affecting the wood and destroying the insulation. It is necessary to provide a drainage pipe for the melting ice, and the outlet should be trapped to prevent passage of air. If hair felt cannot be procured easily, leave a space of 3 or 4 inches between the outside and the inside finish of the box and fill this space with planing mill shavings or thoroughly dry saw-dust.

Fifty pounds per day for 4 months would amount to 3 tons. Allowing for waste, a solid block of ice 6 feet square and 6 feet feet high should be sufficient if properly stored.—Hoard's Dairyman.

Many persons find themselves affected with a persistent cough after an attack of influenza. As this cough can be promptly cured by the use of Chamberlain's Cough Remedy, it should not be allowed to run on until it becomes troublesome. Sold by all dealers.



NO. 350—MIKADO.

For a family carriage this model is mighty hard to beat. We make our Mikado a little longer than others, so that instead of being pinched for room, it is downright comfortable. When you want it for two only the front seat folds close and is scarcely noticeable.

BAYNES BUGGIES.

We hang this Mikado on Baynes five-plate and springs, strong enough for the heaviest load, yet easy riding. Finished extra fancy, as cut shows, full mounted, with fancy trimmings and lining, it makes an elegant carriage

See our catalogue at your dealer's, or if he hasn't one write us direct.

A DAIRYMAN'S PROBLEM SOLVED.

Read what a Dairyman, who used Blatchford's Calf Meal, says:

Digby, N. S., Aug. 10th, 1910

MESSRS. A. A. ARCHIBALD CO., Truro, N. S.

GENTLEMEN:—I have been feeding Blatchford's Calf Meal for about three years, with great success. In June, 1909. I commenced feeding Calf Meal to a bull calf, and killed same in Nov. of same year. This calf was, without doubt, the best one I ever raised; when dressed it weighed 260 lbs., being 4½ months old. The pelt of calf weighed 42 lbs., which was an exceptional heavy weight. I have recommended Calf Meal to a number of my neighbors and they are using it now with good results. I take great pleasure in recommending it.

(Signed)
GEORGE S. NICKERSON,
Brighton, Digby Co., N. S.

MOST dairymen are tempted to sell all the milk that they can produce. It may not be the best for them to do so, but when bills have to be met, something must be done, otherwise embarrassment for the time being often stares them in the face. We believe they all realize the importance of raising the young heifers and bulls, but you know how it is, things must be arranged temporarily at least, it is impossible to give calves the milk. This is something that institute speakers overlook, nevertheless it is an actual condition that must be met somehow. There was a time when one could go out in the back districts and get new milch cows, but that day has gone, too. How to get calves to maturity without milk is the problem. We have solved it for you, but unless we can tell you more about it and unless you will have confidence enough in what we have to suggest, you should not read another line. Our

Blatchford's Calf Meal

is not a tonic, a patent medicine or an offal from a large manufacturing plant. It is a substitute for milk and **will** make bone, flesh, fat and muscles, etc. It is not only the best, but it has stood the test. We have been manufacturing it for a longer time than any of the other supposed calf foods.

We thoroughly understand dairy conditions in the Maritime Provinces and have given your conditions a great deal of attention. We know what you want and so do you, but unless you give Blatchford's Calf Meal a trial, you will still be without what you want. Nothing short of a trial will convince.

Let us assist you in your business. We can do it. Write today for catalogue.

The electrically-welded, solid-piece frame gives strength and stiffness to

Peerless Farm and Ornamental Gates

We build Peerless Gates to last a lifetime—handy, convenient and attractive. They remain staunch and rigid through all kinds of rough usage. The frame is made of heavy steel tubing electrically welded into one solid piece. The Peerless Gate, like the Peerless Fence, saves expense because it never needs repairs. We also make poultry, lawn and farm fences of exceptional strength. Write for free book.

THE BANWELL HOXIE WIRE FENCE CO., Ltd., Box K, Hamilton, Ont., Winnipeg, Man.

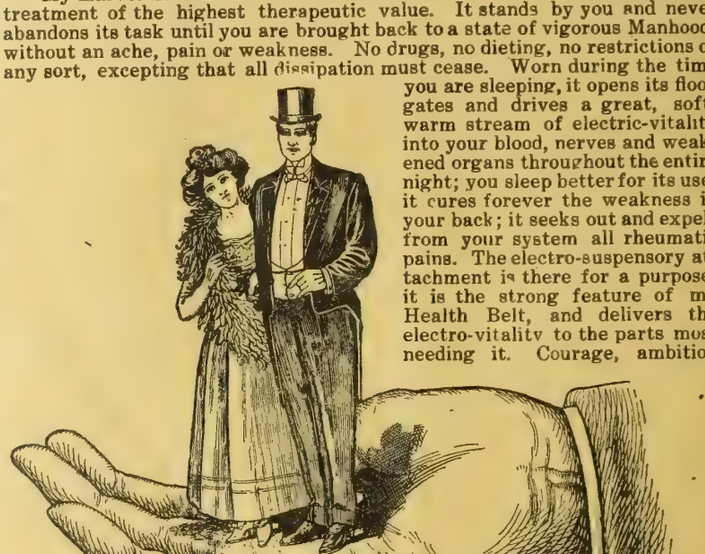
"I Present to You a "Health Belt Man."

He is 55 Years "Young."

Yes, 55 years young; not 55 old for my Health Belt poured vitality into his blood, nerves and tissues until

HIS VIGOR WAS RESTORED

My marvelous HEALTH BELT is a Wizard Worker, a mechanical self-treatment of the highest therapeutic value. It stands by you and never abandons its task until you are brought back to a state of vigorous Manhood, without an ache, pain or weakness. No drugs, no dieting, no restrictions of any sort, excepting that all dissipation must cease. Worn during the time you are sleeping, it opens its flood gates and drives a great, soft, warm stream of electric-vitality into your blood, nerves and weakened organs throughout the entire night; you sleep better for its use; it cures forever the weakness in your back; it seeks out and expels from your system all rheumatic pains. The electro-suspensory attachment is there for a purpose; it is the strong feature of my Health Belt, and delivers the electro-vitality to the parts most needing it. Courage, ambition

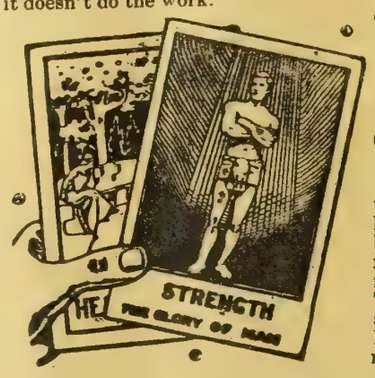


and a new view of life, with full, self-confidence, surely result. It makes you young and keeps you young, with the fire and vigor of the biggest, fullest blooded man you ever saw. The "HEALTH BELT MAN" cannot grow old, for he knows the secret of perpetual youth. It will place you in the "feeling fine class." "I am a man again, thanks to your wonder-working Health Belt. Use my name as you see fit." So writes C. L. Snell, of Middleport, N. Y. So have said thousands before him.

YOU CAN PAY WHEN CURED.

If you're sceptical I'll prove it first. I'll take all risk by letting you have the Belt on Free Trial, not to be paid for until cured. Send it back if it doesn't do the work.

These Wonder Books are



FREE

Call or write for them to-day

Fill in the coupon and let me get these wonder Health Books into your hands. They are sent free, sealed, by mail, and give certain health and nature facts which every man (young, middle aged or old) should have. They fully describe my Health Belt, and are beautifully illustrated. I have known 100,000 men who sought my aid—I should know you.

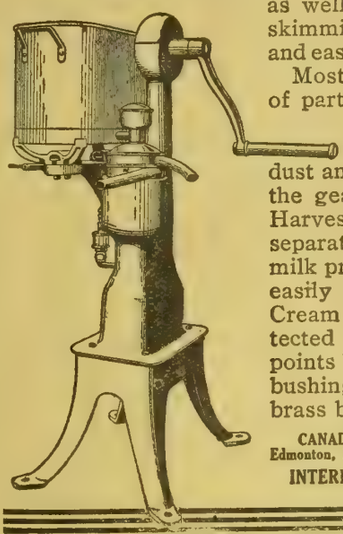
Buy An I H C Cream Harvester
For Its Superior Mechanical Features

THOUSANDS of I H C Cream Harvesters have been sold and are giving perfect satisfaction because of their superior mechanical features. A machine must be right if it bears the I H C trade mark.

When you examine I H C Cream Harvesters, you will see the many I H C features which mean big dairy profits and big savings of work and time; you will find the many reasons for their wonderful strength and durability as well as for their close skimming, easy turning and easy cleaning qualities.



Most of the wearing out of parts, and other cream separator troubles, are due to dust and milk getting into the gears. I H C Cream Harvesters are the only separators with dust and milk proof gears which are easily accessible. I H C Cream Harvesters are protected against wear at all points by phosphor bronze bushings—not cast iron or brass bushings.

I H C Cream Harvesters are constructed with larger spindles, shafts, and bearings than any other separator, insuring greater efficiency and durability. The I H C bowl is free from slots or minute crevices, which make it remarkably easy to clean.

There are many other I H C advantages which the I H C local dealer will point out and prove to you. The separators are made in two styles—Dairymaid and Bluebell—each in four sizes. In justice to yourself, see the I H C local dealer before you decide on any separator, or, write nearest branch house for catalogues and full information.

I H C Service Bureau

The Bureau is a center, where the best ways of doing things on the farm, and data relating to its development, are collected and distributed free to everyone interested in agriculture. Every available source of information will be used in answering questions on all farm subjects. If the questions are sent to the I H C Service Bureau, they will receive prompt attention.

INTERNATIONAL HARVESTER COMPANY OF AMERICA (Incorporated) CHICAGO U S A

A Safeguard As Well As A Cure

The trouble with most cough medicines is that they relieve the cough simply by soothing the local irritation. They help Nature very little in *curing* the inflamed conditions, and do nothing at all toward *strengthening* the weakened parts.

Father Morriscy's No. 10 does all three. It *stops* the cough by clearing away the mucus and relieving the irritation in the passages—it *cures* the inflamed and congested membranes lining the throat and lungs—and it *strengthens* the whole system, and particularly the parts that have been weakened.

Thus it is that No. 10 not only cures the present trouble, but prevents its return.

Hundreds of men and women who were broken down with coughs and colds, and either on the verge of consumption or actually in its grip, are now strong and well, thanks to Father Morriscy's No. 10 and careful living.

Trial size 25c. Regular size 50c.

Society, 1 Shropshire ram, $23.00; 1 Oxford ram, $16.50; 1 Oxford ram, $10.00; 1 Leicester ram, $12.00; 1 Leicester ram, $21.00. Tabusintac Agric. Society, 1 Shropshire ram, $20.00. W. E. Wallace, Penobsquis, N. B., 1 Oxford ram, $27.00. M. H. Young, 1 Leicester ram, $20.00.

SHEEP FARMING OF AN EXTENSIVE SCALE.—The name of Telfer Bros., Paris, Ontario, is almost a household word with all of those who follow the records of sheep breeders at the leading Canadian and United States shows. They have successfully competed against all comers at shows from the Atlantic to the Pacific and from the farthest north to Richmond, Virginia, in the south. Wishing to go into commercial sheep raising on a large scale, Mr. Jas. A. Telfer, one of the above mentioned firm, who has visited nearly every sheep-raising district on the continent, decided to locate in New Brunswick, where he found what he considered one of the best sections for sheep-raising in Canada. He has located on a 750 acre farm at Markhamville, near Sussex. He has placed about fifty-six head of pure bred sheep on the farm and shortly after the new year he will bring another carload from Ontario. He expects to keep up his show ring records and will take some of his best Southdowns, Shropshires, Hampshires, Oxfords, Cotswolds and Lincolns to the Winter Fair at Amherst. He has come to the Maritime Provinces with a determination to make his venture a financial success, and from what we know of his abilities as a shepherd we predict for

DR. J. WOODBURY'S HORSE LINIMENT

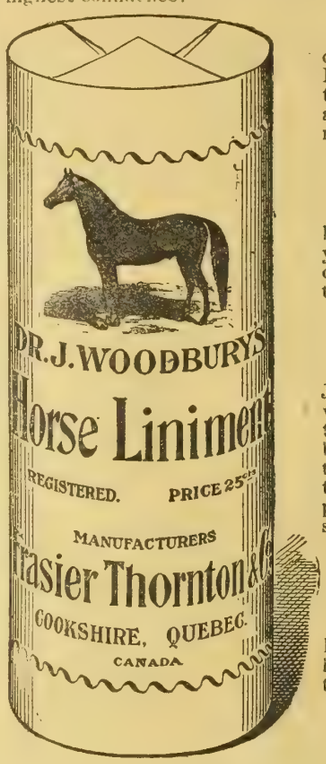
INFALLIBLY THE REMEDY

For the removal of Splints, Bog Spavins, Enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough, Enlargements of the Glands, Affections of the Kidneys. For Distemper, Strangles and Colic it is infallibly the remedy.

All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the fore feet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured.

Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions.

Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.



Bear River, N. S.

Dear Sirs:—We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it. Yours truly,

CLARKE BROS.

Hubbard's Cove, N. S.

Dear Sirs:—I have used Dr. J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use. Yours truly,

C. C. McLEAN.

Truro, N. S.

This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung diseases. It is the best thing to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities, which may exist, and gives the system healthy action.

NEWTON LEE.
Owner "All Right," 5817.

Elmsdale, N. S.

Dear Sirs:—Kindly send me 6 dozen Dr. J. Woodbury's Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly,

ELMSDALE MERCANTILE CO.,
Elmsdale, N. S.

Dear Sirs:—I cured my horse with Dr. J. Woodbury's Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse.

Yours truly, H. R. WHITEHEAD.

Dear Sirs:—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months' standing. In my large experience with horses, I consider this liniment to be the best made for all diseases in the horse, and I recommend it to my friends. E. J. ANDERSON, Truro, N. S.

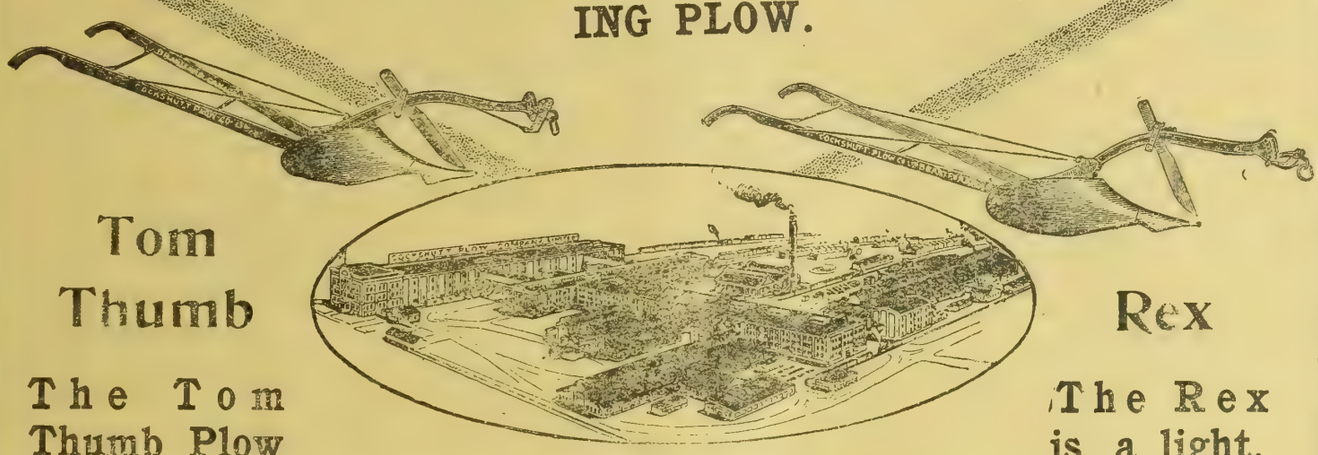
IT ALWAYS PAYS TO CONSULT COCKSHUTT'S

BEFORE BUYING A WALKING PLOW.



Tom Thumb

The Tom Thumb Plow is very popular with market gardeners and others who need a small implement. Although it is light, it is very strongly built, and for sod and general work we know it will give you every satisfaction. The Tom Thumb turns a good furrow from 6 to 8 inches wide and 4 to 6 inches deep. Can be furnished with wheel when required---it is always shipped with colter, extra share and wrench unless otherwise ordered.

Do not fail to send for Catalogue today if you require first-class farm implements of any description.

This is the Finest Plant in the World

Devoted exclusively to the manufacture of up-to-date farm implements. We turn out no fewer than 120 different styles of plows. The three outstanding features of these plows are (1) First-class Material, (2) Strength, and (3) Light Draft. We also make Disc and Drag Harrows, Drills, Cultivators, etc., etc., all of which have made a fine reputation for good work

We strongly advise you to write for our Catalogue to-day and let it be your guide in the selection of all your farm tools. It is the sure way to buy right.

Rex

The Rex is a light, two-horse narrow plow for general work and is used in sections where the land is not plowed deep. Many plowmen prefer it for sod work also, because it turns a clean, narrow furrow from 6 to 9 inches wide and 4 to 7 inches deep. We have made the handles fairly lengthy to ensure easy control by the operator. We always ship this plow with steel board, chilled share, colter, extra share and wrench unless otherwise ordered.

Write for our large Catalogue and let us give you more information about these two plows.

Buy All Your Farm Tools From The Cockshutt Catalogue.

COCKSHUTT PLOW COMPANY LIMITED BRANTFORD

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad. as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

WANTED.—Hides, calfskins, sheep and lamb pelts, J. J. McLEAN & SONS, Hopewell, N. S.

D. G. McKAY & SON,
Scotsburn, Pictou Co., N. S

him a successful career. We trust his success will far exceed his expectations and that some of our young men who are prone to leave their farms may learn from him and go at some branch of the farming industry with the views that he seems to possess. Mr. Telfer believes that instead of the Ontario exodus continuing Westward, it is only a matter of a short time until Ontario's sons will look Eastward where they can make an easier living and more money than in Ontario or the West.

A HEARD HEADER FOR THE COLLEGE HOLSTEINS.—The Holstein bull, Count Mercena Paul, which headed the herd owned by Gavin Harding, Graham's Road, P. E. I., has been selected by Prof. M. Cumming, to head their Holstein herd, at the Nova Scotia Agricultural College Farm, Truro, N. S. This bull is sired by Count Mercena Posch and his dam is the famous DeKol Pauline Sadie Vale, grand champion female at the Toronto Industrial exhibition.

Weather conditions are such that roads are almost impassable consequently very little heavy produce has been marketed for the past two weeks. Trade in general has been quiet and merchants are complaining. Prices of farm produce remain about stationary except for a few minor changes with the exception of pork which is lower, the supply of this has been heavy and almost all the small orders have been cut out so that the full supply was thrown on the packers and they were unable to handle it fast enough, consequently prices have dropped to a point perhaps a little below what would have occured had the farmers used a little better judgement, sending them forward. Potatoes are very scarce and the prospects are that prices may be put still higher in order to bring out enough for local use. Eggs are also very scarce and supplies have fallen off so that prices quoted are purely norminal. Butter is quite plentiful and prices are easy this applies more particularly to dairy as creamery is firm at prices quoted Poultry is not coming out very freely and while there is enough to supply demand for immediate use there is no more than is needed, Beef cattle of good quality are scarce and while there is quite a lot of ordinary quoting they are selling at fairly good prices, quality considered. The demand for hay for shipment this fall is about over and prices are likely to be easier, in fact the bulk of the hay now on hand will have to be carried over by the farmers till spring. Some fairly large shipments have been sent to England by the Manchester boats, but the last one left this morning, she took upwards of 300 tons. Oats are quiet at unchanged prices.

MEN WANTED

We want a reliable man in each locality to introduce and advertise our Royal Purple Stock and Poultry Specifics, and other goods, direct to consumers as well as to merchants. $15 a week and expenses or commission. No experience needed. The largest advertised goods in Canada. Write at once for particulars.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure—**you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourself at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. I know that my home treatment is a safe and sure cure for **Leucorrhœa** or **Whitish discharge, Ulceration, Displacement** or **Falling** of the **Womb, Profuse, Scanty** or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths**, also **pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weakness peculiar to our sex.**

I want to send you a **complete 10 days' treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address,** tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost,** my book—**"WOMAN'S OWN MEDICAL ADVISER"** with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers of Daughters,** I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness, and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies in your own locality who know and will gladly tell any sufferer that this **Home Treatment** really cures all women's diseases and makes women well, strong, plump and robust. **Just send me your address,** and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. Address:

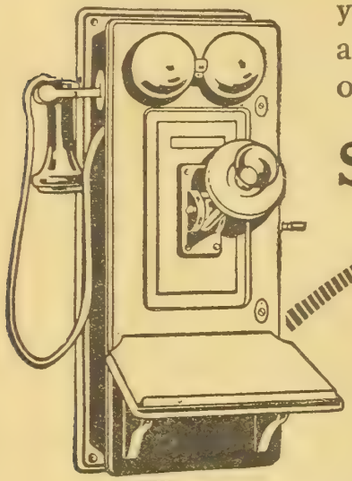
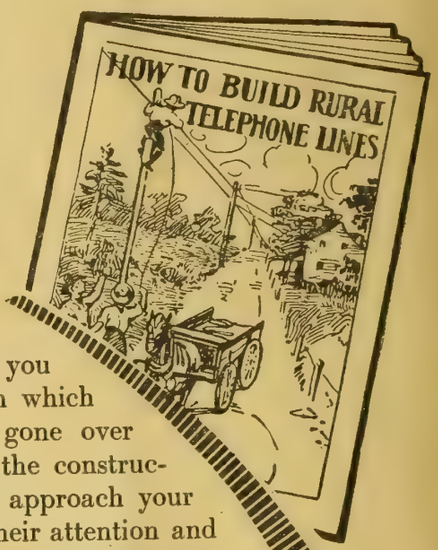
R. G. McLEOD & SON,
Landsdowne Station, Pictou Co., N. S

We Want To Send This Book To Every Farmer In Whose Neighborhood There Is No Rural Telephone System!

WE want every farmer in Canada to know how to build Rural Telephone Lines. We want to put the whole story of Rural Telephones before you so that you will have all the details at your fingers' ends and so that you can go out among your own neighbors and organize a telephone system in your own community.





Send Us YOUR Name And Address—

and we will be pleased to send this book to you absolutely free. On account of the clear manner in which it has been written, we believe that after having gone over this book carefully, you will know enough about the construction of Rural Telephone Lines to enable you to approach your neighbors with every vital fact in detail, to command their attention and to secure their interest and support on a telephone system for your own community.

Our No. 1317 Type Telephone Set

is the set with the famous No. 48 type generator, the most powerful and efficient generator on the market to-day; with a ringer having 3-inch gongs, the loudest ringing gongs ever put on any telephone set; with the standard long distance type transmitter and receiver. This set, which was specially designed for Rural Telephone work, by the most expert telephone engineers on this continent, is told about fully in the book.

The Story That The Book Will Tell You

is a story that is full of interest and of vital importance to every farmer in Canada. We believe that every farmer realizes the advantages of a Farm Telephone; but we also believe that few farmers realize the simplicity of organizing and constructing a Rural Telephone System of their own. The details of organization are simple, the costs of installing the system are low and the only reason that a greater number of communities have no rural system of their own, is due to a lack of accurate knowledge on the question of the Rural Telephone.

We offer you this book that you may possess this knowledge; for, sooner or later, a Rural Telephone System is going to be started by you or somebody else in your own neighborhood. Now is the time for you to get busy. Write to-day for Bulletin No. 140. REMEMBER WE SEND IT FREE.

Vol. 16. SUSSEX, N. B., DECEMBER 20, 1910 No. 6

I Wish YOU Were Like Mr. Fraser

I WISH you'd do as he did—for your own good. Like a great many other people he had seen many of our advertisements. Had read some of them, just as you are reading this one. The time came when he was figuring on a new roof and he read one of our advertisements very carefully.

He thought, as maybe you do, that a wood shingle roof was the least expensive, and though not the best nor most durable, was at least "good enough" for him. But our ads. said that Oshawa Steel Shingles cost about the same as wood shingles and were less expensive to put on. That sounded promising.

Further he read that slate cost six times as much, and so-called "ready roofing" cost thirty-three times as much. That Oshawa Steel Shingles were fire-proof, leak-proof, rust-proof, rot-proof, rain-snow-and-wet-proof, need no painting, no patching.

In fact Oshawa Steel Shingles, according to our advertisements, seemed to be everything man could desire in a roof—the absolutely perfect roof. So good that he doubted the truth of our claims. "It sounds too much better than ordinary roofs" he thought (He'd heard other roofing people talk extravagantly, and thought "Oh, yes, it's easy to talk big, but will the roof make good ?") Then he read my guarantee. That impressed him as being very straightforward, dependable. "If that means all it says: "A perfect roof for 25 years, or a new one free" he thought, "why this advertisement is no idle boast." "By using Oshawa Steel Shingles I settle the roofing question definitely for at least 25 years. If this concern is financially responsible that guarantee seems to cover everything."

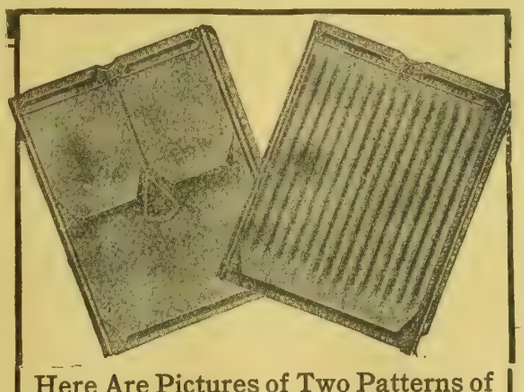
"Guess I'll send for their booklet, anyway, and look into the facts a little further." And he did. He got all the facts, before deciding. That's where I wish you were like him. I want you to get all the facts about Oshawa Steel Shingles. THEN you can decide. You only fool yourself if you doubt one word I say about our Steel Shingles. You take no risk. My guarantee protects you against disappointment—absolutely. You'd not think of using any other kind of roofing if you actually KNEW how good a roof my Oshawa Steel Shingles make.

How Do You Figure ?

Figure the cost now, material and time, for every kind of roof you know anything about. Oshawa Guaranteed Steel Shingles, you'll find are as cheap to begin with as the poorest wood shingles. It's a fact. Figure the cost per year of each kind of roof. Compare the **estimated** life of other roofs with the **guaranteed** life of Oshawa Steel Shingles, and your figures will show you which is the best and cheapest roof for you to buy.

When I say "Guaranteed for 25 years" I mean it —No "Ifs" About it.

Some makers of metal shingles (notice they don't say "steel") talk boastfully about roofs of theirs which have stood the test for 25 years back. But if you buy their shingles do they positively guarantee to you a perfect roof, no leaks, no rusted holes, no need for paint, no bother whatever, for **the next twenty-five years?** That is what you are interested in—**your own roof**—**not** some other fellow's. Do they? Pedlar does. You may know people who have lived to be eighty, but that is no guarantee of your life. Oshawa Steel Shingles are the **only kind** that are clearly, positively, guaranteed for **any** period.



Here Are Pictures of Two Patterns of Oshawa Steel Shingles (Guaranteed)

They come in squares 10x10 ft.—covering 100 square feet of roof at a cost of only $4.50. They are stamped from heavy sheet steel—28 gauge steel—then galvanized with zinc, so thoroughly that all kinds of weather can't make a rust-hole in them for longer than your lifetime.

PEDLARIZE All Your Buildings, Inside and Out

By "Pedlarizing" I mean doing for the whole building what Oshawa Steel Shingles do for the roof. I make other kinds of sheet metal building materials—for ceilings, side walls, outside—that make your whole building more fire proof, more sanitary, more beautiful, more substantial. You should know about them. May we send you a booklet and pictures that tell the whole story? It's free. Write for it to-day.

Rain-snow-wind-proof Fire and lightning proof No painting, No patching

E. A. Pedlar

No bother at all with your Oshawa Shingled roof once it's on your building. Notice we don't merely **say** this. We **guarantee** it, with a guarantee that is legally binding—good for a new roof right up to the last day of the twenty-fifth year. That means it must be absolutely weather-proof. Also it is fire-proof, wind-tight, safe agaist lightning, and keeps the building warmer in winter and cooler in summer. And your need never worry with repairs. Isn't this the kind of roof you want ?

What More Can You Ask of a Roof ?

A roof that is practically one big seamless sheet of tough, galvanized steel, without a crevice or crack anywhere for water or wind to get into, that keeps out the heat of summer and the cold of winter—an absolutely perfect roof for the next twenty-five years. Why should you even consider **any** other kind ? Certainly you should not fail to get **all** the particulars about a roof **like this.** Don't you think so ? Then write for our book—to-day. It is free —from our nearest office.

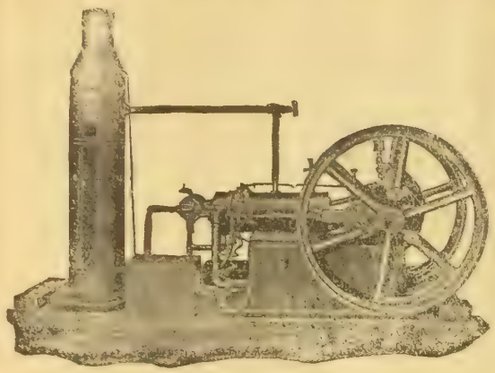
Farmers of Quality



Stationary and Mounted, in 1 1-2 to 30 Horse Power

Want Quality

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the **"Ideal"** is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of seating directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinder head, so that when the valves become worn, the valve cage and valve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn, you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer

"Ideal" Gas and Gasoline Engines are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price

You Can Furnish Your Home FREE!

ANY housewife buying goods at the stores mentioned below may have their cash purchases apply on Asepto Soap Premiums. Every cent you spend counts toward a premium. A sure and mighty convenient way to save without increasing living expenses. Over 300 premiums of honest value to select from. The list will be increased every few weeks. Furniture will be offered next. The old way was to allow premiums to apply on Soap Wrappers only. Now at any of these stores—no matter what you buy—everything has its equivalent in Soap Wrappers. That is every five cents spent counts the same as one wrapper, while purchases of our goods as here advertised entitles you to two coupons—the one the merchant allows and the ones found in or on our goods themselves.

Dr. White's Honey Balm.—A cough syrup that is safe and sure. We are positive that no other cough syrup equals it. Price 25c. Equal to 5 soap wrappers.

Pendleton's Panacea.—The best hot medicine, in use nearly 100 years. Every person knows it is good. Price 25. Equal to 5 soap wrappers.

Brown's Cutilive.—A witch-azel cream for chapped hands, sunburn, etc. Price 25c. Equals 5 soap wrappers.

Scott's.—Salts, Senna, Sulphur, Saltpetre, Borax and Alum in 5c packages. Equal to 1 soap wrapper.

Brown's Spearmint Tooth Paste.—Sweetens the breath, prevents decay, hardens the gums and whitens the teeth. Price 25c. Equals 5 soap wrappers.

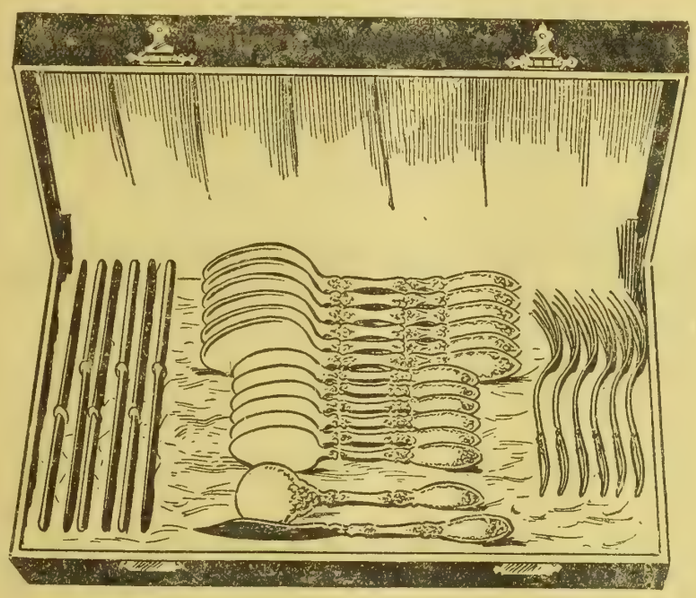
Napatho Soap.—A pure laundry soap, containing naptha and incorporated by a process that prevents it from hurting the hands, as other Napatho Soaps do. The wrappers count for premiums.

Scott's Fruit Syrups and Lime Juice.—Pure and excellent flavor. 10c, 15c and 25c. Coupon on the bottle.

Ebony Polishes—None better, bothpaste and lustre. Coupon on each box. Try them.

Sapid Tea.—A blend selling at 40c, in 1 lb. packages only. Blended by J. Harvey Brown, one of the most competent tea men in Canada. Each package carries a coupon equal to 8 soap wrappers.

Dr. Scott's White Liniment.—The largest bottle and best liniment. Price 25c. Equal to 5 soap wrappers.



Banner Spices.—In packages only. Absolutely pure. ¼ lb. packages carry coupon equal to 2 soap wrappers.

Venus Floating Soap.—Made from pure vegetable oils and unexcelled for the toilet and bath. Price 25c. Coupon counts for premiums.

Banner Flavoring Extracts.—All flavors and from 10c to $1.25 per bottle. Coupon on each bottle.

Herner's Dyspepsia Cure.—The only kind that tells you to eat what you like while taking it. Money back if not good. Price 35c. Equal to 7 soap wrappers. Price $1.00. Equal to 20 soap wrappers.

Brown's Stomach and Liver Pills.—A good family pill. Price 25c. Equals 5 soap wrappers.

Scott's Furniture Polish.—Renews the life of old furniture. Price 25c. Equals 5 soap wrappers.

Asepto Soap.—Is equal to the best and contains the same antiseptic features that Asepto Soap Powder does. The wrappers count for premiums.

Scott's.—Nitre, Glycerine, Iodine, Iron, Squills, Friar's Balsam, Carbolated Oil, Camphorated Oil, Castor Oil, Sweet Oil, Oil of Tar, Sewing Machine Oil, Spirits of Camphor. Price 10c per bottle. Equal to 2 soap wrappers.

Asepto Soap Powder.—Has been the greatest success of any soap or powder ever put on the market. This is the best evidence of its quality. It is antiseptic as well. It absolutely sterilizes every article washed. Think what this means to a family. Price 5c, and the trade mark counts for premiums.

The following stores are now in a position to explain to you what this offer means :—McLeod & Spence, Port Elgin, N. B.; F. L. Rayworth, Bayfield, N. B.; W. H. NEXT SHORT COURSES

AT

The Agricultural College

TRURO, NOVA SCOTIA,

JANUARY 3rd to 13th, 1911.

Last year over 300 farmers and their sons, ranging in age from 16 to over 70 years, attended. We want more this year.

At the same time, Short Course for Ladies in Horticulture, Dairying, Poultry and Domestic Science. This is becoming a very popular course and should attract a large attendance.

The Faculty will be assisted by men from the Federal Department at Ottawa, from the staffs of New Brunswick and Prince Edward Island Departments of Agriculture and by men successfully engaged in farming in the Maritime Provinces.

Tuition to all Maritime Province Students free.

All railways grant single railway fare on the Standard certificate plan.

For further particulars apply to

The Tenth Maritime Winter Fair.

Bigger and Better Than Ever

THE Tenth Maritime Winter Fair was held, in the Fair Building, Amherstl N. S., on the 5th, 6th, 7th and 8th, inst. The weather man sent bracing, frosty weather, and throngs of the citizens of the Maritime Provinces visited the fair each day. The number of entries in each class exceeded that of previous years; the quality of the various exhibits was excellent, and, now that the 1910 fair is over, the various visitors can truly say that it was "bigger and better than ever." Every department was so well filled that, if as much increase takes place during the next year or two, it will be necessary, ere long, to further increase the floor space of the build. ing. We have no doubt when the necessity arises the good citizens of Amherst will uphold their past records of progressiveness in Winter Fair matters. For the first time in the history of the fair, ladies were charged an admisssion fee and any observing citizen who had visited the fair on previous occasions can vouch for the wisdom of this new departure.

The meetings in the Auditorium were well attended and never before have we seen such universally good order at Winter Fair meetings, as prevailed this year—a fact which made it easier for the various speakers and more interesting and instructive to an appreciative audience.

Col. H. Montgomery-Campbell, the genial president of the fair; F. L. Fuller, the efficient secretary-manager and their capable staff of superintendents and assistants in the various departments deserve the highest compliments and support that Maritime farmers can give them for the very successful manner in which they looked after the duties of their respective offices. It is the unanimous verdict, of all concerned, that they are the right men in the right place as it is realized that they are carefully guarding the best interests of Maritime live stock. When we consider, as Prof. Cumming puts it, that "Live Stock is the basis for successful Maritime agriculture" and that successful agriculture concerns every man, woman and child in Maritime Canada, either directly or indirectly, the safe-guarding of the live stock interests safeguards an industry of prime importance to all our citizens.

THE JUDGES

of the respective classes were:

Beef Cattle—W. R. Elliott, Galt, Ontario.

Sheep—J. H. Grisdale, Ottawa.

Swine—C. M. McRae, Ottawa.

Dairy—D. Drummond, Ottawa; Harvey Mitchell, Ottawa; V. C. Daigle, Moncton, N. B., and W. A. McKay, Scotsburn, N. S.

Poultry—F. C. Elford, McDonald College, Que., and A. C. Smith, of Waltham, Mass.

Seed—E. D. Eddy, Ottawa and S. J. Moore, Truro.

Fruit—R. W. Starr, Wolfville, N. S.

Dressed Carcasses—R. W. Elliott, J. H. Grisdale and C. M. McRae.

Honey—E. L. Colpitts.

All these gentlemen are well known to many of our readers and it is needless for us to say that their work was done in their usual efficient manner.

After the annual dinner on Monday evening, the public opening took place in the Auditorium. Col. H. Montgomery-Campbell presided, and before introducing the speakers gave a short outline of the Fair from the time of its inception.

His Worship J. M. Curry, Mayor of the town of Amherst delivered the address of welcome and said that the success of his town was due to the public mindedness of its citizens and their co-operation in matters of general interest.

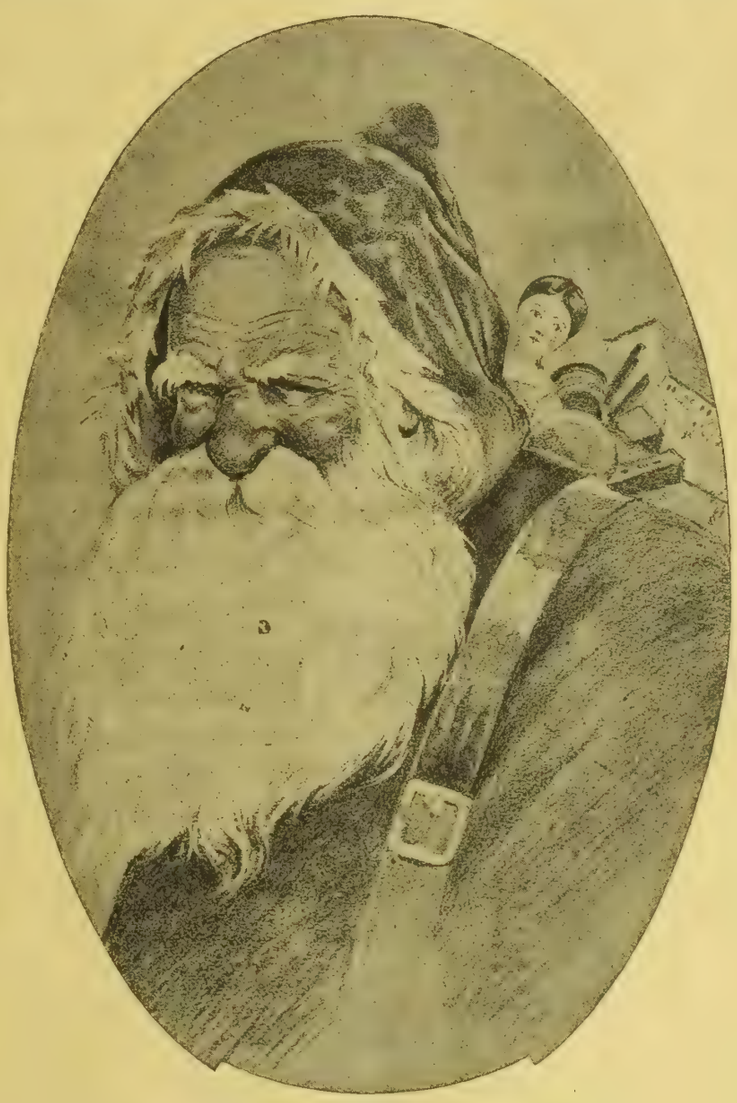
Mr. H. J. Logan, president of the Amherst Board of Trade paid a fitting tribute to the memory of The Late Governor Fraser. He referred to Amherst as the Guelph of the Maritime Provinces and the Burmingham of Eastern Canada and closed his address by inviting visitors to visit Amherst's various industries.

His Honor, Lieutenant Governor McGregor, af Nova Scotia, who formally opened the fair, was amazed at the excellence of the various exhibits he had seen in the building. He thought the government grants given to the fair were very justiable expenditures, that would be paid back with compound interest, not only in cash, but in helpful object lessons and experiences. He was glad to know that the fair was being run by men of sound business principles and it was on them that the success of the fair largely depended.

THE BEEF CLASSES

No fewer than one hundred and thirty-five animals were shown in the Shorthorn, Hereford and Grades, of any breed classes. The general consensus of opinion was that there were fewer poor specimens of the beef breeds present this year than ever before and that the average quality of the animals was much higher than in other years. There were a few animals of good conformation that would have stood higher up among the list of prize winners had they been better fitted. There was strong competition in the Shorthorn and grades classes. Mr. W. W. Black had everything his own way in the Hereford class which was as usual, well fitted.

The principal Shorthorn exhibitors were: Messrs. C. A. Archibald, of Truro, N. S.; Cecil Coates, Nappan N. S.; Hazen Etter and Harold Etter, Westmorland Point, N. B.; Geo. M. Holmes and Fred T. Hol es, Amherst; Chas. W. Forrest, Amherst, Point; Albert Anderson, Sackville, N. B.; Samuel C. Lane, Pownal, P.



AT CHRISTMAS TIME.

When Janie hangs her stocking up
She's very nice and sweet,
And as you see, that hose must be
Immaculately neat.
From tip to toe no hole must show,
Lest Santa backward hurl
A glance amiss, instead of this :
"God bless the little girl."

When Jimmie hangs his stocking up
He does it with a shout,
And nothing cares for snags or tears
Or where a toe poked out.
The biggest one that he can find,
That's Jimmie's greatest joy,
And Santa'll wink and laughing think
"God bless the merry boy."

Col. H. Montgomery-Campbell
President of the Maritime Stock Breeders' Association.

E. I.; Jas. E. Baker & Son, Barronsfield, N. S.; Fowler Bros., Amherst Point; W. Guy Dixon, Point de Bute; DeMont Freeman, Amherst and J. McCully Pipes, Nappan.

In the Grades, of any breed classes, besides those mentioned above, Edwin Forrest, Amherst Point; Laurie M. Anderson, Sackville; C. W. Pugsley, Barronsfield, N. S.; Thos. J. Etter, Westmorland Point; Courtney Lusby, Carson Gourley, Amherst and John McDonald, Jr., St. John, N. B. were the principal exhibitors.

A full list of awards will be found on another page.

In the Shorthorn class the first prize aged steer, out of Princess Louise by Cyprus Scott and shown by Cecil Coates carried off the championship for steer, any age, but in the block test he went down to fourth place. The most outstanding winner in the show was C. A. Archibald's Merry Maid 5th, a two-year-old heifer, that carried off the Shorthorn female championship and grand championship, silver cup, donated by M. J. O'Brien, won in 1909 by Mr. Archibald, for the best Shorthorn animal, any age, and also the grand championship disc harrow donated by the Massey-Harris Co., Ltd., of Toronto, Ont., for the best beef animal, any breed or grade and also the Blatchford Calf Meal Factory's special prize for best beef animal, over one year, fed on Blatchford Sugar and Flaxseed.

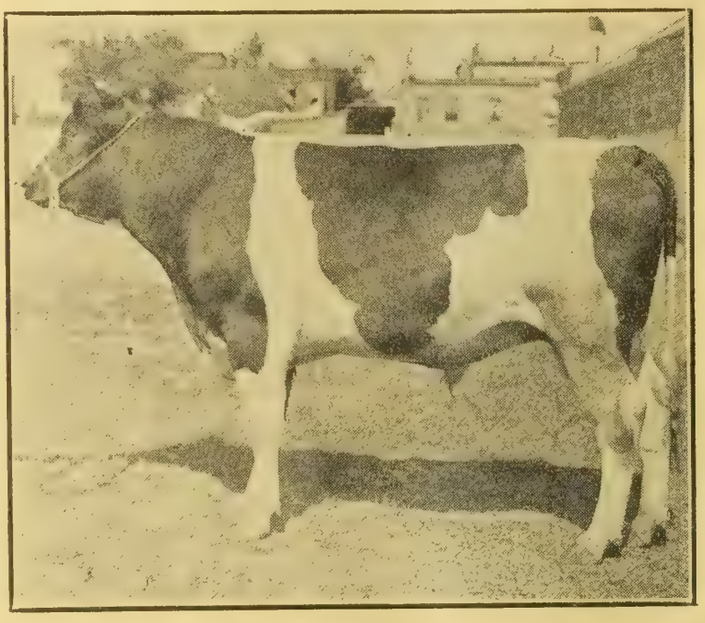
Merry Maid V. was bred and raised by Mr. Archibald and was champion Shorthorn at all the fall fairs. Her dam was second prize female at the Halifax exhibition. The old cow will undoubtedly be remembered by visitors to the first Winter Fair as the calf that captured the champianship award at the first Winter Fair nine years ago. That Prof. Day made no mistake when he placed Merry Maid at the head of a closely contested class, nine years ago, is amply shown by the enviable record that she and her offspring, including this year's grand champion has made. Besides her suburb qualities she has a careful leeder and breeder to look after her in such an intelligent way as to keep her and her offspring at all times doing their very best.

The first prize aged Hereford steer, Climax, captured the reserve grand championship and the silver cup donated by Hon. Sir Frederic Borden, for the best animal, any age. This cup having now been won three times by Mr. Black becomes his property as does the silver cup donated by Hon. Wm. Pugsley for best grade beef animal, won for a third time by Mr. Black, with a two-year-old grade Hereford steer, the original of the second prize dressed carcass.

Fowler Bros.' second prize aged grade Shorthorn steer headed the list in the block test. The Blatchford Calf Meal Factory's special for best calf under one year, any breed or grade fed on Blatchford Calf Meal was captured by one of W. W. Black's grade Hereford calves.

THE DAIRY TEST.

On another page of this issue will be found a complete record of the seventy-two cows entered in the fourty-eight hours dairy test. The rules governing the test are also published on the same page and the reader can see how the various scores are figured. The table shows the standing of the cows in the respective sections of each class. The sections are as follows: Sec. 1. Cow, four year old and upward. Sec 2. Cow, three years old. Sec. 3. Heifer two years old. The table shown on another page is so arranged that the entries in each class are grouped together, by following the column showing the score of points made the reader can easily pick out the animals that made the highest score Keillor's grade Holstein cow won the sweepstakes silver cup. Look over the records and see the standing of the respective breeders.



Ida Rooker II's Vale
First Prize Senior Yearling Holstein Bull at the 1910 Dominion Exhibition, St. John, N. B., owned by W. M. Lea, Victoria, P. E. I.

SHEEP.

The sheep classes were well filled with stock of excellent quality.

Albert Boswall and S. C. Lane, of Prine Edward Island were over with their Leicestes.

In the Lincoln sections Albert Boswall, C. W. Pugsley, Barronsfield, N. S.; Chas. Symes, Minudie, N. S., and Jas. A. Telfer, Sussex, N. B., strove for supremacy.

H. B. Parlee, Sussex, N. B.; John Tweedy, Ernscliffe, P. E. I., and Jas. A. Telfer were on hand with their Cotswolds.

Chas. Symes, Minudie, N. S., had the only Cheviots shown at the fair.

Dorset Horns were shown by Geo. L. Boswall and Cephas Nunn, of Prince Edward Island and Hartland Poultry Yards, Hartland, N. B.

Cephas Nunn and Oliver C. Saunders, of P. E. I.; Jas. E. Baker & Sons, Barronsfield, N. S., and Jas. A. Telfer, Sussex, N. B., were exhibitors of Southdowns.

In the Shropshire classes, Jas. A. Telfer, Geo. L. Boswall, Cephas Nunn and Logan Bros., and Jas. J. Stewart, Amherst Point, were the principal competitors.

Burder Goadwin, Baie Verte, N. B., Jas. E. Baker & Sons had the Telfer put up a three cornered contest in the Oxford Down section. played a duette in the Hampshire Cephas Nunn and Jas. A. Telfer sections.

Albert Boswall, Jr., of P. E. I., had no competition with his Suffolks.

Nearly all the breeders referred to above had enteries in the class for grades and crosses.

A glance at the list of awards on another page will show who is who in the respective classes. The "why" of the matter is simply because they had the goods.

Jas. A. Telfer had the first prize winner in both sections of the dressed carcass class, the best wether lamb, the best Oxford ewe, and the best three shearling weathers.

Jas. J. Stewart had the best pen of four lambs all one breed and the best pen of six wether lambs.

Jas. E. BaRker & Sons had the best flock of short wool sheep.

There were about two hundred and sixty sheep entered twenty of which went to the block test.

The quality of the various animals shown was all that could be desired and the time has come that an animal must be possessed of exceptionally good merits in order to win in such company as is shown at the Winter Fair.

SWINE

were there in abundance—a total of one hundred and twenty-seven, sleek, fat, contented porkers, but alas for sixty-five of them, their hour had come and to the block test they went. The quality in the respective classes was away up. The grand champion pig was shown by W. J. Gibson, Marshfield, P. E. I., who won the "Atlas Stock Food" cup. The grand champion pen of three sows was shown y Peter Brodie, of Little York, P. E. I., who having won it for a third time becomes its exclusive owner.

See list of awards on another page.

THE POULTRY.

The poultey exhibit was a record breaker, both in quality and numbers. Birds that could easily be winners in their classes a few years ago were this year outside the money altogether. No branch of live stock at this, now important fair, has shown such a marked improvement as the poultry.

F. L. Fuller
Secretary of the Maritime Stock Breeders' Association and Manager of the Maritime Winter Fair, Amherst, N. S.

Starting nine years ago with a few dozen coops of inferior birds, it has rapidly improved, year by year. This year with its 1500 entries, exclusive of pigeons, it takes first rank in poultry exhibits east of Ottawa, Ontario, and in many classes it surpasses that show. Hundreds of new coops have been added and new floor additional space allotted and still the accommodations were crowded.

If the interest increases, as in the past, more room will be needed, and better light is certainly needed as it overworkes the judges to get proper light for their work.

The popular utility classes were out in force. White Wyandottes established a record both over their own class or any other class ever exhibited at the Amherst fair. Barred Plymouth Rocks were a good second and Buff Orpingtons third. The quality of these varieties was as good as they were in numbers. The quality was certainly all that could be desired. In these popular varieties the day has passed when one exhibitor can boast of more than one or two firsts in the four sections.

White Plymouth Rocks made an improved showing this year. The quality of the winners was away up.

Golden, Silver, Buff and Columbian Wyandottes all made a grand showing.

The Mediterreanian varieties were next in numbers to the Americans.

Brown S. C. Leghorns were most numerous and the quality better than ever. S. C. Whites, the best yet shown. Buffs, a nice class. While the Rose Comb, White, Brown and Buff Leghorns made a much better showing than in previous years. S. and R. Comb Black Minorcas were a show in themselves and had quality to burn.

Rhode Island Reds were a disappointment in numbers but some good specimens were shown. Games, Hamburgs, Polands and Houdans were well represented. Bantams made an interesting and pleasing addition to the show. Pigeons were out in force—twelve large collections were entered as against two or three last year.

Turkeys, Geese and Ducks were well represented by choice specimens af their respective breeds. Their showing was much superior to last season's representatives.

Dressed poultry came to the front again with the best quality of stock shown for years. We hope to see

(Continued on page 190.)

How Can Alfalfa Growing Receive a Boost in the Maritime Provinces?

Editor Maritime Farmer:

On page 101 of your second November issue you inquire how we of the Maritime Provinces can get the Alfalfa habit? and the inquiry is followed by half a dozen very pertinent questions.

In reply to the first, I would say that I have grown it—not in either of the three provinces you refer to but in far off English "shires and in the far off times of thirty years ago.

I grew it to supplement the annual sowings of winter rye and vetches for the soiling of the working teams. It was very effective for this purpose but three three-horse teams hard at work all summer left none over for the cows, the calves and the pigs who would no doubt have been glad to have been allowed to pay for a further area for themselves. I was not, however, pressed for the two latter classes as at that time I had a good sized patch of Prickley Comfrey, Symphitum Asperrimum, not S. Britannicum, if you please, which has been fraudulently sold in this Province. I should be greatly obliged, sir, if you or any of your readers could tell me how S. Asperimum winters here. For pigs and calves, it is the most valuable soiling crop one can grow.

To get back to our Lucerne. It is certainly worth "establishing" to use your own word which involves the idea of a very well cared for crop growing on land very carefully and liberally prepared; rather than the seeding down of the barley piece with alfalfa instead of timothy and clover.

The Provincial Governments can certainly encourage its cultivation. At any rate, that of Nova Scotia can for Professor Cumming is certainly aware, not merely of its own value, but of the value to the agricultural community of carefully considered sysyems of summer soiling; the keystone for the different arches which may best be found in the flourishing little patch of alfalfa close to the barn. And he will, we must hope, be good enough to allow or to direct, the use of the organization of which he is master towards so useful an end.

Remembering the scheme for the dairy side outlined on pages 97, 98, one feels tempted to ask him whether he would not do for a Maritime alfalfa league what Prof. Rutherford is doing for the Canadian Record of Performance.

It is none too soon to be moving if anything is to be orgaoized for next spring's planting.

There should be a sweepstakes formed with a small annual entry fee. I wonder if Prof. Cumming could get us an equal sum to add to it. The provinces should be mapped out in suitable competing areas and each area allowed three prizes.

The [illegible] would begin at once and grow as time went on, but no decision of value could be reached under four years, five would be better. The inspectors or judges, could do it in eight or ten visits and by the latter part of the time would have cut out nine-tenths of the unsuccessful contestants. In fact the cold-footed and those who had made some bad mistakes in the start would close out on their original investment, the entry fee of fifty cents or eighty cents as the case might be.

The rules for the competition and those for [illegible] require very careful thought as they would have to stand for the full period involved. They should be published in your paper and a copy sent to each entrant.

I think that if you will take some such scheme as the above, add to it such further suggestions as others of your readers may make and polish it up a bit that it may be presented to Prof. Cumming, we may hope within the time set to see the most valuable of all the agricultural legumes beginning to do its part for us.

I should perhaps, say, that twenty years ago, in this country, I tried a small sample of alfalfa and another of sainfoin. To my disappointment, both plants failed ignoiminously. I know now two very good reasons what they did, and laugh. At that time such knowledge was not available.

GEO. W. SHIPTON.
Annapolis Co., N. S.

Editor's Note.—In our last issue Mr. S. B. Hatheway suggested that the keynote to successful alfalfa growing was covered by the word "Tile." He realizes the importance of underdrainage. In this issue Mr. George W. Shipton, who has been a successful grower of Alfalfa in England has some suggestions to offer. The ball has been started rolling. Help to keep it moving by relating any experiences you may have had with this wonderful legume. If you don't want to write, ask questions. If you have any helpful suggestions do not hide your light under a bushel. If you do not wish your name to appear with your suggestians or questions, we can withhold your name. Pass the word along.

How Gan Alfalfa Growing Receive a Boost in the Maritime Provinces?

Every one of our farmer friends are asked to make suggestions. We will give them widest publicity possible. C. W. McDougall, Dairy Superintendent for New Brunswick, has demonstrated to us that Alfalfa can be grown successfully in New Brunswick. Have any of our Nova Scotia or Prince Edward Island friends been able to produce it? Is it worth trying to establish on our farms? Can the provincial governments do anything to encourage its growth? If so, what do you suggest? Is there any information regarding it that THE MARITIME FARMER can publish? Can we be of any assistance, if so how? A few suggestions for you to answer are asked with the hope that you will act at once. We want to hear from every farmer in Canada. You are at liberty to take up any phrase of the question that you see fit and are not confined to the questions we have asked. Address communications to

Mulching Strawberries.

The time for mulching strawberries will soon be here. For this purpose use good clean straw free from weeds. Shake it out well and spread evenly over the plants about one inch deep. It is not necessary nor advisable to cover heavy. If placed too thick early, frosts will be kept out and a weak development at the crown liable to result which may be injured by severe frosts later on. On the other hand, a light covering permits of root development in the late fall, allows a gradual hardening off of the plant, gives a fairly free circulation of air about the plant, and will hold snow to protect the plants when more severe weather approaches.

Covering should be done about the middle of November, or after ground is sufficiently frozen to carry a team. About three tons of straw is required to cover an acre. In the spring the covering may be parted over the plants, thus holding moisture and keeping the fruit free from sand.

Spruce boughs may be used to advantage. Leaves also make a good cover. Swamp hay, unless placed very lightly and well shaken out, is not advisable, as it settles too compactly over the plant. A heavy moss liable to decay such as strawy horse manure should not be used except very lightly. Excelsior well shaken out makes a good cover.

(Continued on page 190.)

Soliloquies of the Hired Man.

I am the farmer's hired man. I am hired by the month. If I suit and leave before my month is up I get nothing for the time I have worked. If I don't suit I get what is coming to me and get out. Of course there is no agreement of that kind, but that was what happened at the last two places I worked. My rooms in the ell over the woodshed with the thermometer ten below, I will have no cause to complain that my health will be ruined because of poor ventilation. My bed is made of four posts, the mattress is made of straw, (this suits me because of a hump on my back.) There are no "slats", woven cord answers the purpose better. As I am not accustomed to washing in my room, a place has been provided on the platform just outside the kitchen door. This was a happy thought of the "boss"; it makes me "move some" these frosty mornings and the good wife does not have to keep breakfast waiting as she probably would if a warm room and warm water were supplied. We work on the ten-hour system—ten hours before and ten hours after dinner. The first thing to do after being called at 3.30 o'clock is to make the fire, feed 75 head of cattle, milk twenty cows, feed the horses, hens and pigs, fill the woodbox behind the stove full of wood, run the milk through a separator. The boss used to run it when new, but it is a little out of gear at present and he is not as strong as he used to be. He is going to have it fixed the first time an agent comes round. One more trip to the barn and hog pen with the skim milk and I am called to breakfast. After another wash we all sit down to a long table in the kitchen where we are served with pancakes and molasses, sometimes fried pork together with bread and molasses, with strong tea. The missus told me the other morning that as the cream went to the factory, she did not make butter at home and the groceryman charges too much for ordinary country people to use it. After breakfast—this is about 6.30—I hitch a pair of horses, weighing about 900 pounds each, to a large wagon and hie for the woods. The boss informs me that when he was my age he went to the same woods and made four turn a day and never brought less than a cord to the load. The first day I only got out two loads of about one-half a cord each. I suppose I lost some time as I loaded a cord on the wagon the first time and when I was ready to start the horses were not, they were stuck hard and fast. I had to unload and the way the "boss" looked at me when I eventually arrived home with less than a half-cord on, was a caution. He said some things about the kind of help we have nowadays, which was not very flattering. As I was bound to stay my month out or get nothing for the work I had done I said nothing. As it was now nearly dinner time I went to work doing "chores" around the barns, hog house, etc. We had a dinner consisting of fried salt pork—the missus forgot or was too busy to soak it—bread and molasses and tea. I almost forgot that there was apple sauce.

Will tell you more in next issue as to how I get along.

THE HIRED MAN.

THE MARITMIE FARMER

And Co-operative Dairyman.

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association The Nova Scotia and P. E. Island Fruit Growers' Associations The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers Association, and The New Brunswick Poultry Aassociation.

Subscription Price **$1.00** per year. **When paid in advance 50 cts.** Persons taking advantage of the 50 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for dis. continuance is given.

The date after your name on the little green label on front Page is, in every case, the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—**"I saw" your adv. in the MARITIME FARMER.**

PEACE ON EARTH.

Two thousand years ago the shepherds rejoiced to hear the angel choir singing "Peace on Earth Good Will to Men" and year by year since that time has the glad message been heralded throughout the universe. The birth of Christ has today a significance to a larger portion of humanity than at any time in history. The Christmas season brings with it festivities associated with the anniversary of earth's most joyous event. That Christmas this year is celebrated on the anniversary of the day on which Christ was enthroned on high, gives it a double significance. Steadily as time advances the two-thousand-year-old story is being told over and over again and men and women are making sacrifices that the day soon may come when "Thy will will be done on Earth as it is in Heaven" shall be nearer a reality. The greatest need in the world today is that the teachings of Jesus Christ be more closely followed. Though His chart for mankind was laid down so many years ago it has stood the test of time and still points mankind towards the right with the same truth as of old. Though oppression still holds sway to a greater or less extent, the world as a whole is growing better. Mankind is beginning to see and to understand more clearly the indifinite wisdom of the words spoken by the Man of Sorrow. In this busy world where man is too deeply concerned in material things it is well that Christmas comes every year to recall the Divine command to love our neighbors as ourselves. Nothing more can be done to make this old earth approach the Heavenly ideal than to spread abroad the truths promulgated centuries ago by the Christ whose birth we are shortly to celebrate.

LAST CALL TO 1911 SHORT COURSES.

Before another issue of the Maritime Farmer reaches our subscribers, the New Year 1911, will be ushered in. You will undoubtedly be making some ew resolutions at this season of the year—why not include in the number one that will lead you to attend the short courses at the Nova Scotia Agricultural, College Truro, N. S., on January 3rd to 13th There is ample provision for both ladies and gentlemen.

It is a matter of vital importance that you should attend the short courses.

The educational value of short courses at the Agricultural colleges is becoming better recognized by farmers and even by the professors. It is true the term of two or three weeks is short and the instruction incomplete. Yet there is the stimulus of meeting with others who are interested in agriculture, of seeing things done according to the approved methods, and the revelation of new facts or the presentation of old facts in a new light. There is also the pleasure of change, social intercourse, and withal a little holiday, to give inspiration and encouragement to those attending to return home to work, and to work more successfully.

It might be supposed that very little actual teaching can be done, but rather that a lot of facts, recipes, and rules are handed out. Even in the shortest of courses, however, a definite attempt is made to train the classes, and not merely load them up with information. For example: A class in stock-judging is assembled, and a member of the class asks the instructor which is the best breed of dairy cow. The instructor, even if he has a private opinion on the matter, answers that there is no best breed, but that it depends partly on the breeder's taste and partly on local conditions and markets. Then two or more cows of the same breed, or of different breeds, are brought in before the class, and the students are asked to handle them and judge them as individuals. If now the instructor is asked to decide which is the best cow of the group, he will not only answer, but give reasons for his answer. The lesson learned by the students is, that there may be more difference between individuals of the same breed than between two breeds, and that it is more important for a farmer to know a good individual cow when he sees her than to know which is the best breed.

Similar training comes in the seed-judging. If a member of the class asks which is the best variety of oats to grow, he may or may not get a definite answer. He may be told that a certain variety has given the best results over Ontario, but that does not settle the question entirely for the individual farmer. His soil and locality may require another variety. What he learns of more importance than this, is to know good seed from poor seed, and the difference between the yields from good seed and poor seed. He learns that for any particular soil and locality there may not be much difference between two varieties, but that there is all the difference between success and failure in sowing good seed or poor seed. And when he has learned these two things—the importance of sowing good seed, and how to select good seed his ability as a breadwinner is distinctively increased.

Poultry as a marketable product has become very scarce and dear the last year or two, and the importance of poultry as a revenue-producer on the farm needs to be emphasized. More than that, ten per cent. of the eggs marketed in Ontario prove bad. It is evident that enough attention is not given to this branch of production, and that there must be a great deal of careless methods of handling and actual dishonesty in the egg-trade. The short course in poultry-raising is designed to make farmers more efficient and careful in this work.

In the horticultural courses the instruction given covers such subjects as the selection of land for fruit; varieties suited to particular localities; budding and grafting; strawberry growing; care of young orchards; spraying outfits; preparation and application of sprays; packing, handling and shipping. The rapidly growing home market, as well as the export trade, promises a great future for fruit-growing in Canada, but in this as well as in other farm enterprises, the five-fold personal equipment is essential to success.

Dairying is a well-established industry in Canada, but each generation has to be especially trained, and new men must be prepared each year to supply vacancies in creameries and cheese factories, so a number of dairy courses are offered, from a few days' course in milk and cream-testing to a three months' course in butter and cheese-making.

A RESOLVE FOR EACH NEW YEAR.

To be joyous in my work, moderate in my pleasures, chary in my confidence, faithful in my friendship, to be energetic but not excitable, enthusiastic but not fanatical; loyal to the truth as I see it, but ever open-minded to the newer-light; to abhor gush as I would profanity, and hate can't as I would a lie; to be careful in my promises, punctual in my engagements, candid with myself and frank with others; to discourage shams and rejoice in all that is beautiful and true; to do my work and live my life so that neither shall require defence or apology; to honor no one simply because rich or famous and despise no one because humble or poor; to be gentle and considerate toward the weak, respectful yet self-respecting toward the great, courteous to all, obsequious to none, to seek wisdom from great books and inspiration from good men; to invigorate my mind with noble thoughts as I do my body with sunshine and fresh air; to prize all sweet human friendships and seek to make at least one home happy; to have charity for the erring, sympathy for the sorrowing, cheer for the despondent; to leave the world a little better off because of me; and to leave it, when I must, bravely and cheerfully, with faith in God and good-will to all my fellowmen; this shall be my endeavour during the coming year.

CANADIAN GEESE FOR UNITED STATES.

Last year live geese to a considerable amount were shipped from Prince Edward Island to the United States, and a number of American buyers were there this fall who were purchasing for the Boston and New York markets. The fattening is done in the United States. It is claimed that the geese from the island fatten well and yield richly in rendered grease, used in many households in the place of lard. The average live weight is 8½ pounds and the freight is 10 cents each. The prices paid to farmers in 1908 were from 60 to 65 cents per goose; in 1809, 80 to 85 cents; and this season 10 per cent. more than last year. Shipments of dressed geese, which will amount this year to about 35,000, have commenced. Most of these go to the other Maritime Provinces and to Newfoundland, the remainder to Boston and New York. The prevailing prices of dressed geese are from 12 to 13 cents per pound.

The exports of live poultry from Canada during the fiscal year ended March 31, 1910, amounted to $120,623, of which $111,241 worth went to the United States; poultry, dressed and undressed, to the value of $32,432 and $26,730, respectivelly, went to United Kingdom.

SOME OF THE MEN WHO "DID THINGS" FOR MARITIME AGRICULTURE DURING 1910.

In this issue will be found a large plate, printed on coated paper, the pictures of some of the active workers for the advancement of Maritime Agriculture during the year 1910. Some others who also took an active part in the work were asked for their photos but we presume they were too modest to have their pictures appear in the public press. We are getting this groupe framed and it will occupy a prominent place in our office. We would suggest that our readers do likewise and thus familiarize themselves with some of the men who "did things" for Maritime Agriculture during the year 1910.

EDITORIAL NOTE.

Our readers will be pleased to hear that Dr. J. Standish, of the Nova Scotia Agricultural College, who was injured by a run-away accident at Truro has recovered from the effects of his injuries which hapily were not so serious as at first reported.

Rules Governing the Milk Test.

56. All cows shown in pure-bred classes must be recorded in Canadian Maritime or reputable English or or American records, and certificates produced. The name of breeder and the age and record number of the animal must be given at the time to making entry. In the case of grades a statement giving the number and kind of crosses; and if from a pure-bred sire, the name and number of the sire must be given at the time of making entry.

58. The cows in the test shall be milked dry in the presence of the judges at 1 p. m. December 4th, and the test will conclude at 1 p. m. on December 6th. The percentage of fat in the milk will be determined by the Babcock milk tester and the percentage of solids not fat will be determined by ascertaining the specific gravity of the milk and then estimating the amount of solids not fat, by the use of the authorized formula for the purpose.

59. Cows entering in this department must be in the building not later than Saturday evening Dec. 3rd

60. The standing of the respective cows will be computed on the following scale; 25 points for each pound of fat; 3 points for each pound of solids, not fat; 1 point for each ten days in milk after the first 30 days. Limits ten points.

61. No cow, four years old or aver shall win first prize that does not produce at the rate of 10 pounds of butter per week, or a 2nd or any other prize that does not produce at the rate of 8 pounds of butter per week. No three year old cow shall win a 1st prize that does not produce gt the rate of 9 pounds of butter per week, or a 2nd or any other prize that does not produce at the rate of 7 pounds of butter per week. No heifer two years shall win a 1st prize that does not produce at the rate of 8 pounds of butter per week, or a 2nd or any other prize that does not produce at the rate of 6 pounds of butter per week.

62. An affidavit may be required from each exhibitor in the Dairy Department stating the number of days his exhibits have been in milk; also stating that each cow is shown in her proper class and that she is the animal named on the registration certificate produced.

The peculiar properties of Chamberlain's Cough Remedy have been thoroughly tested during epidemics of influenza, and when it was taken in time we have not heard of a single case of pneumonia. Sold by all dealers.

LIVE STOCK.

Winter Care of Fall Calves.

Where one is patronizing the creamery or selling milk or butter on the market it is more profitable to have calves come in the fall than in the spring. The reasons for this are that milk brings higher prices then, and one has more time to milk, and the further reason that the fall calf properly cared for is better than the spring calf. The spring calf cannot utilize grass to any great extent until it is three or four months old. If it comes in April or May it can use grass only in the fall months; whereas the fall calf, if properly cared for during the winter is ready for grass as soon as it appears, and seems to labor under the impression that it is a yearling. Its efficiency, growth and development, however, depend very largely on the care given it in the winter.

As alfalfa, clover, hay and grain feeds are plentiful in most parts it is easy to bring the calf through the winter in good condition. It should be fed a liberal ration, but not overfed. The best grain feeds are flax, meal, oats, corn and barley. If the calf is a heifer and intended for use in the dairy, it should be given but little corn, the ration being made up mainly of oats and barley with all the good clover or alfalfa hay it can eat.

Sunlight is a very necessary feature and the calf should by all means have it. No one can expect to grow a calf worth its keep if it is kept in a dark, damp place during the winter season.

The fall calf well cared for is worth quite as much in the following April as the calf with the usual attention dropped in March, April or May, and therefore five or six months older.

Winter in the Stables.

Winter is now well upon us and it is to be hoped that Mgritime Farmer readers are well prepared for it with warm, light, convenient stables and barns, and plenty of palatable, nutritious food for all their farm animals.

The first requisite for a stable is that it shall be conveniently and healthfully located; the next, that it shall be so built and arranged in all its fittings, that it shall be comfortable and attractive for those who are to care for the farm animals. Give these, good animals of their class, plenty and a variety of foods, and the winter's work becomes a pleasure as well as a source of profit. The term convenient, of course, carries with it the idea of a good supply of water so located as to be accessible by every animal without exposure to rains, snows or winter winds.

I believe the ideal system of watering is to provide for it within reach that ny animal is ever benefited by not have this, however, but have a trough always kept full in rear of tie-up, and each animal is untied and by simply turning around and stepping a few feet helps herself to water always at a temperature well above freezing. In fact, none of the family is obliged to step out of doors at any time in winter to get wood or water, to feed or care for any animal, to hitch up the team and get all ready for a sleigh ride or a day's work.

A warm and light stable well ventilated is always a healthy one and the writer has yet to be convinced that any animal is ever benefited by being turned from a stable on a winter day to "exercise" in the yard, however well it may be sheltered.

A principle in connection with successful animal feeding, that is its very foundation, is that no animal shall ever be allowed to get unduly hungry. Hunger, long felt, dwarfs growth and interfers permanently with production. The wise feeder understands this and provides against it. He knows an animal may refuse to eat really nutritious food, and still be hungry. He provides against the former condition by such a selection of foods as shall contain all the necessary nutriments in fairly good proportion, and against the latter by having such a variety, each first class of its kind, that the appetite never ceases till the needs are fully supplied. Variety, palatability, abundance, form the trinity of successful live stock feeding.

I hope none of the Maritime Farmer family are deceiving themselves with the idea that any young, growing animal can be overfed. I hope every colt, calf, lamb or pig has his appetite fully satisfied with the best the farm affords, that fits his needs every day. I hope every dairy cow and every working animal is so fed as to be at its best and that a sufficient surplus of food is given to fully maintain its health and vigor, during even its hardest periods of labor.

FARMER.

Pictou Co., N. S.

Receipt for Removing Lice on Stock.

Make a strong brine, have it warm wash thoroughly. The salt from meat is best. One application when put on thoroughly is sufficient.—A. J. Riggey, Garrard Co., Ky.

The Water Tank.

The water supply for our stock is a problem which demands daily attention, and it is of much importance at all seasons af the year. With dairy stock it has much to do with the profits of the business, for foul water is then a matter of public health, and ice water in winter causes a shrinkage in the milk flow.

When we consider that 85 per cent of milk is water and that an animal requires several pails each day for body use, it is important that the cow drink all she wants each day. For this reason the water supply should be kept in the best condition, and, if possible, before the animal, so she can take it whenever she wishes it.

The water tank is not complete without a heater, for fuel is cheaper than grain, and cows will not drink their fill of ice water. A tank should also be so arranged that it can be emptied and cleaned out with ease, for the open tank will gather dirt and filth very rapidly. I have made it a rule to have the tank cleaned every Monday, clean or dirty, and I might say it is nearly always dirty.

In the making of large dairy records the animal must be encouraged to drink a large supply of water, and to do this the water must be clean and tempered to 50 or 60 degrees Fahrenheit. It is also well to salt the ration so as to stimulate thirst.

The ground around a water tank is often a mud hole or an icy place in winter where the cattle dread to go, and thus will not drink what they should. Cinders, or better yet, a cement foundation, will prevent this trouble and by having the drain opening on the bottom and conducted away to a low place through a pipe or box the tank can be emptied without getting water around it.

Copper sulphate is the best tank wash I have yet found, and it can be used in the following manner:

After the tank is emptied and the dirt washed out, take a small handful of copper sulphate or blue stone, and dissolve it in a pail of water, then with a broom or brush wash the walls and bottom of the tank. Most of this water should be washed out, but a little left in will do no harm. This will prevent the green slime from growing in the tank and will at the same time kill nearly all forms of disease germs.

A. E. HAECKER.

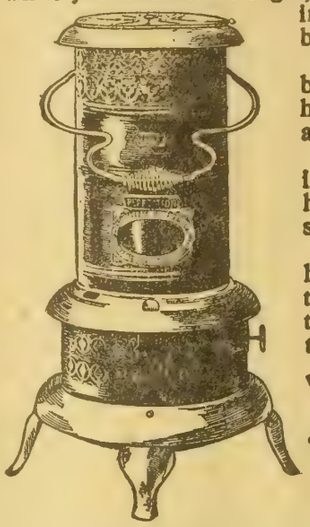
Influence of Age.

Bulletin 146, Purdue University Argicultural Experiment Station gives the results of three years experience to determine the influences of age on the economy and profit from feeding cattle.

The results of this work justify

Temporary Heat Quickly

Did you ever stop to think of the many ways in which a perfect oil heater is of value? If you want to sleep with your window open in winter, you can get sufficient heat from an oil heater while you undress at night, and then turn it off. Apply a match in the morning, when you get out of bed, and you have heat while you dress.



Those who have to eat an early breakfast before the stove is radiating heat can get immediate warmth from an oil heater, and then turn it off.

The girl who practices on the piano in a cold room in the morning can have warmth from an oil heater while she plays, and then turn it off.

The member of the family who has to walk the floor on a cold winter's night with a restless baby can get temporary heat with an oil heater, and then turn it off. The

PERFECTION SMOKELESS OIL HEATER

Absolutely smokeless and odorless

is invaluable in its capacity of quickly giving heat. Apply a match and it is immediately at work. It will burn for nine hours without refilling. It is safe, smokeless and odorless. It has a damper top and a cool handle. An indicator always shows the amount of oil in the font.

It has an **automatic-locking flame spreader** which prevents the wick from being turned high enough to smoke, and is easy to remove and drop back so that the wick can be cleaned in an instant.

The burner body or gallery cannot become wedged, and can be quickly unscrewed for rewicking. Finished in japan or nickel, strong, durable, well-made, built for service, and yet light and ornamental.

Dealers Everywhere. If not at yours, write for descriptive circular to the nearest agency of the

ANDREW WATSON, 90 Youville Square, MONTREAL, - QUE.

EUREKA

SANITARY CHURN

There's no comparison between the ordinary wooden churn and the "EUREKA". Barrel is stoneware—top is clear glass.

Besides being absolutely sanitary, the glass top enables you to see how the churning is coming along without opening the churn.

Also made with Aluminum top.

The "EUREKA" is the easiest churn on the market to operate. By tilting back the frame until the weight rests on the wheels, the churn can be quickly and easily moved—while the barrel remain upright.

If your dealer does not handle the "EUREKA," do not take a substitute but write us for catalogue.

10 A

EUREKA PLANTER CO. LIMITED, WOODSTOCK, ONT.

the following conclusions:

1. The initial cost per hundred of calves is greater than that of older cattle.
2. The length of time necessary for finishing steers decreases with the increased age of cattle.
3. The rate of gain and the cost of gain increase with the increased age of the cattle.
4. The proportion of roughage to concentrates consumed increases with the increased age of the cattle.
5. The amount of gain necessary in finishing cattle of equal condition decreases as their age increases.
6. The difference in total quantity of feed necessary for finishing cattle of different ages and fed to the same marketable finish is negligible.
7. The average margin required between buying and selling prices to prevent loss was $1.60 per hundred on calves, $1.71 on yearlings and $1.55 on two-year-olds; the margins secured on a stationary market were $2.02 on calves, $2.22 on yearlings and $2.29 on two-year-olds, resulting in a profit of 42 cents per hundred on calves 51 cents on yearlings and 54 cents on two-year-olds.
8. The increase in live weight necessary to make calves prime was 103 per cent; yearlings, 54 per cent, and two-year-olds, 43.6 per cent, of their initial weights at the beginning of the feeding period.
9. At an uniform price for feeds the difference in cost of gains between calves and yearlings was $1.35 between yearlings and two-year-olds 28 cents per hundred pounds.
10. The experienced farmer who feeds cattle should handle older cattle in preference to calves; while the farmer who produces and finishes his own cattle may find calves more preferable.

Feeding Breeding Swine.

Swine that are to be used for breeders need different feed from those that are to be fattened for the market. The breediog swine should not be fat at any time; that is, fat from the market standpoint. They should be kept growing on nutritious food from the time they are pigs and should never be fed the amount of corn, sugar beets and other fattening foods that the market hogs some times get. Excessive fatness destroys the powers of breeding in many animals. The professional breeder takes care to so feed his animals that are to be sold for breeders that they will do good work when they go into the hands of the farmers that buy them. Very frequently, however, some farmers begin at once to undo the work of the breeder by feeding corn in excessive quantities.

Among the feeds that should be given is skim milk, which is very good, as it contains a large amount of protein, and is bulky. Clover is an exceptionally good feed in the green state and even clover hay steamed proves very nutritious. Oil meal cake contains much nutriment of the right kind. Where alfalfa can be had it is also good. Oats in various forms furnish the exact kind of nutriment most serviceable for the breeding animals.

The sow that is carrying pigs needs a large amount of protein food on account of the extra bodies she is building up. But care must be taken not to have too much protein in the food, as the starchy parts are also needed. The strach-forming elements should be five or six times the protein elements. This is about the composition of oat-meal. Bran is a highly nitrogenous feed and should be balanced with something else when it is fed. All plants that have pods are rich in protein and are thus good materials out of which to make food for breeding swine.—W. H. Underwood.

Concrete Fence Posts Like These

Note the diference between concrete and wood.

Note the diference between concrete and wood.

are sightly, strong, permanent.

Concrete is, in many localities, cheaper than wood, for fence posts, and more durable than stone, brick or iron. Our book,

"What The Farmer Can Do With Concrete" is sent FREE.

It tells how to make, not only fence posts, but walks, curbs, horse blocks, barn foundations, feeding floors, well curbs, drinking troughs, silos, dairies, and many other farm utilities where cleanliness, strength and durability are required.

Many of these things are simple and inexpensive to make, and may easily be put together in your spare time. The book carefully and simply tells all. The regular price of the book is 50c. We are distributing free, a limited number, however, and charging up the cost to advertising. That's why you get *your* copy *free*, if you sign the coupon and send it to-day. *Do it now.*

You may send me a copy of "What the Farmer Can Do With Concrete."

HORTICULTURE

Fruit at the Maritime Winter Fair.

When the Maritime Winter Fair was first held nine years ago, the exhibits of fruit, from a great many Maritime Province Counties, consisted of a mixed quantity of very indifferent fruit. Many specimens of undersized, scabby apples were shown We have carefully followed the improvement that has been yearly taking place in this department and each succeeding year finds a better class of apples on the plates than was shown the preceeding year.

Despite the fact that the year 1910 brought an off season to our fruit growers, the average quality of the fruit exhibited at Amherst, was better than ever before and in keeping with the other sections of the fair.

Mr. A. G. Turney, Provincial Horticulturist for the Province of New Brunswick, was on hand with an excellent display of plate and box varieties of New Brunswick grown fruit, that was a revelation to all those who did not visit the St. John Fruit Show last month. Cheered on by Mr. Turney, the New Brunswick fruit growers are rapidly coming to the front with fruit of such good quality that no one can gainsay nor deny that some sections of New Brunswick are as well adapted to fruit growing as any part of Canada.

The Dominion Department of Agriculture made a display of boxed fruit from Nova Scotia, New Brunswick, British Columbia and Ontario, to show the contrast between the apples grown in the respective provinces. This display also showed our Maritime Province men that the products of their own orchards compare very favorably with those from orchards in some of the more Western provinces.

The varieties shown from British Columbia were: Ben Davis, Gravenstein, Baldwin, Northern Spy, Jonathan and McIntosh Red.

Ontario showed: King, Ben Davis, McIntosh Red, Baldwin, Northern Spy and Gravenstein.

The Nova Scotia collection consisted of Spitzenburg, King, Blenheim, Ben Davis, Northern Spy and Gravenstein varieties.

In the display of County Collections, the number of entries from the Nova Scotia counties were as follows: Pictou, 3; Kings, 2; Hants,3; Annapolis, 1; Antigonish, 1; Cumberland, 4 and Colchester, 2.

From Prince Edward Island came two collections from each of the three counties, Kings, Queens and Prince.

Eleven of New Brunswick's fifteen counties sent collections as follows: St. John, 2; Westmorland, 1; Albert, 1; Kings, 3; York, 2; Sunbury, 2; Queens, 3; Gloucester, 1; Charlotte, 1 and Victoria 2.

There was a sweepstakes prize donated by the Spramotor Co., for the best county exhibit. The outstanding collection was shown by Mr. W. B. Wallace, Newport Landing, Hants Co., N. S.; but as Mr. Wallace had won a Spramotor prize on two previous occasians his exhibit was not eligible for competition this year. Mr. Wallace's collection contained: Gravenstein, Blenheim, Stark Russett, Baldwin, Fallawater, Ben Davis, Northern Spy, Ribston and King varieties. Baring the above mentioned exhibit the judge, Mr. R. W. Starr reported as follows: "The enteries in the competition for the Spraymotor Sweepstakes prize for best collection of fruit were: No. 9, Thos. Aylward, Falmouth, Hants Co., N. S. No. 88, H. A. D'Almaine, Wolfville, Kings Co., N. S. No. 153, L. E. Healy, Church St., Kings Co., N. S. No. 166. N. N. Hamblen, Durham, Pictou Co., N. S. and No. 9?, John Dewar, Queens Co., P. E. I.

No. 88 won, leading on the following points: Freedom from blemish, uniformity, form and commercial value, other points equal. No. 166 ran a good second in color, uniformity, form, size and nomenclature, but failing slightly in freedom from blemish and commercial value

No. 95 showed a good collection of well grown fruit, nearly free from blemish, good in color, form, uniformity and nomenclature, but lacking in commercial value, for many of the varieties have not, at present, the standing in the fruit markets that they may possibly have after a few years when the sorts are better known by growers and consumers."

The sweepstakes collection consisted of Ribston, Blenheim, King of Tompkins, Golden Russett, Baldwin, Stark, Gravenstein, Fallawater, Northern Spy and Nonpareil varieties.

The Pictou County collection contained Blue Pearmain, Bishop Pippin, Rinston Pippin, Baldwin, Fallawater, Blenheim, Gravenstein, Northern Spy, Bethel and King of Tompkins apples.

The Queens County, P. E. I. colton had, Gravenstein, Stark, Wealthy, Baxter, King, Gano, Ribston, Wagener, Spy and Ontario varieties.

War on Insect Pests.

The ravages of the Brown Tail moth in the Annapolis Valley, the spread of the Tussock moth and the rapidity with which the Gypsy moth is approaching has caused the Halifax Civic Improvement League to start a campaign of education with the view of bringing to the attention of the public the necessity of immediately taking some steps to combat these pests before they gain too firm a foothold.

Dr. C. Gordon Hewitt, Dominion entomologist, in the course of an address before the League, dealt with all three of these pests, their life cycle and the best means of combating them, as well as what both the Dominion and Nova Scotia Governments were doing in the matter.

Dr. Hewitt said that in Canada the loss of crops each year through such causes would be ten per cent. of the total value, which would be about fifty million dollars. This would be to the crops alone, the loss to the forests would be quite another item. In Eastern Canada all the larches had been destroyed by such pests, and now there was another sweeping over the Province of Quebec like a wave of fire. Such facts as these tend to make the people more alive to the dangers of such pests.

In Nova Scotia the most dangerous fruit pest was the brown tail moth. In the city the danger was to the shade trees by the Tussock moth and with such beautiful trees as there are in Halifax it is a pity to see them destroyed. The Gypsy moth had not as yet reached Nova Scotia, but was rapidly coming.

Dr. Hewitt, in dealing with the Tussock moth, showed a number of the insect in its various stages of life, and said that in combating the moths the best time is when they are in the egg state. Then collect the eggs and burn them or to paint the egg masses with creosote, one touch of which is sufficient to destroy the eggs. Then paint around the trunk of the tree, about four feet from the ground, a band of tanglefoot about four inches wide. As the female moth cannot fly and the only way she can get into the tree is by climbing this will prevent that. Then in the summer sprinkle the trees with poison. The tanglefoot should be placed on the trees before the end of May.

The Tussock Moth was much easier to combat than the Brown Tail, which was an European pest that got into Massachusetts from France in 1890. To prevent any other of these pests coming inta Canada from Europe, the Government has given the Department the power to inspect all nursery stock coming into Canada from foreign countries and now all stock is inspected before it is delivered. Last year the Inspectors found 313 nests of brown tail moths in apple stock imported from France. The Dominion Government was doing all in its power to prevent the spread of these pests. All the brown tail male moths are able to fly and coming into Canada from the United States in that manner. It is thought that these moths came to Nova Scotia on boats running between the Province and the New England States.

The Brown Tail moth not only destroys the trees but also renders some places uninhabitable. The caterpillar is covered with a quantity of little hairs that get into the skin and blood of people and cause what is known as the "brown tail rash.'j This rash is a serious one and a person thus afflicted is often confined to bed for several days and sometimes results in death.

The Gypsy Moth while it had not as yet reached Canada, was now within seventy-five miles of the border. The Gypsy Moth is much easier to combat than the brown tail and its life cycle is like the tussock. It feeds an all vegetable matter even eating grass after it has stripped the trees. The females cannot fly, but will lay its eggs in almost any place. There are no parasites from this pest in this country and large sums of money are being spent to import them.

All stock imported from France now bears a certificate that it had all been inspected before being packed, but it is also inspected when it arrives here. The same applies to stock imported from the United States and is not unpacked unless there is an Inspector present. This winter the Dominion Government will send special inspectors though the Annapolis Valley to work in conjunction with the provincial government. A few years ago the Brown Tail Moth could be found from Yarmouth to Kentville. but now, due to the work of Prof. Cumming and his staff, none could be found west of Digby. If necessary, pressure should be brought to bear to have an appropriation made to carry on the work and all precautions should be taken to protect the trees.

Gourlay Pianos

THE PHENOMENAL SUCCESS OF THE

Gourlay Pianos

is not accidental, but the natural result of the realization of a higher ideal in piano quality than ever before recorded in the history of Canadian piano building.

Musicians and all music lovers who are ready to acknowledge superiority have recognized their superlative qualities and voluntarily paid them unstinted praise.

Allow us to tell you more about them. Ask for Catalogue and prices.

188 Yonge Street, Toronto, Ont.

EGZEMA CURE WORTH LIKE ITSELF.

To all who are suffering from Eczema and other skin diseases it is WORTH LIFE ITSELF to know that a simple wash of Oil of Wintergreen, Thymol, and other carefully compounded ingredients gives instant and positive relief to that awful burning itch.

Yau know that unless you do get relief from that torturing agony, life is not worth living.

Write the D. D. D. Labotatories, Dept M, 49 Colborne St., Toronto, for a free trial bottle of this wonderful Eczema wash. It is called the D. D. D. Prescription. The very first drops will give you absolute and instant relief. They will show you that life is worth while, for your suffering ceases with the very first application, and you feel that in D. D. D. Prescription you have at last found a cure. At any rate, you know you have instant relief.

For sale by all druggists.

SIXTEEN MONTHS ON CRUTCHES!

NOW COMPLETELY CURED

PERTH, N.B.

"I am writing this to let you and sufferers from Rheumatism know of the wonderful benefits I have derived from GIN PILLS. For two years, I was an invalid, incapable of work of any kind. For sixteen months, I was unable to move without the assistance of a crutch and cane. I was treated by our best doctors as well as taking treatment from a specialist in Chicago. I did not improve and had about given up hope of ever being well again when a friend advised me to try GIN PILLS. This I did, and with a two months treatment was a well man again. This was four years ago and I have had no return of my trouble since.

I still use a box or two of GIN PILLS a year, just as a preventative and am enabled to go fishing and shooting in the spring and fall, and lie out on the ground at night, without any inconvenience.

GIN PILLS are a wonderful medicine and I take great pleasure in recommending GIN PILLS to all sufferers from Rheumatism, for I have no doubt that if they will persist in the treatment, GIN PILLS will do for them what they have done for me".

ALEX. W. STEVENSON.

GIN PILLS are sold by all dealers at 50c. a box—6 for $2.50. Sample free if you write us. National Drug and Chemical Co. Dept. M. F. Toronto.

National Lazy Liver Pills are just what you need if the bowels are "tight" or the liver torpid. They act gently but surely. 25c. a box. 65

Messrs. C. C. Richards & Co.

Gentlemen,—I suffered for years with bronchial catarrh. I commenced in January last (as an experiment) to use MINARD'S LINIMENT which gave almost instant relief. And two bottles made a complete cure and I have had no symptoms of a return of the trouble since March.

Gratefully yours,

MARK BURNS.

The Challenge of the West.

British Columbia has challenged the provinces of Eastern Canada to hold a "National" Apple Show. What is the East going to do about it? Our Eastern growers claim to have more extensive areas of land adapted to growing apples of high quality than can be grown in British Columbia. They profess to grow apples of better quality. British Columbia growers now say "Prove it."

The challenge falls properly at the feet of Ontario fruit growers. Granted that we have the fruit districts and the fruit, have we got the men who can "prove it?" The apple producing and consuming districts await the answer.—Canadian Horticulturist.

New Brunswick Apples at the Royal.

Editor Maritime Farmer:

The following awards were gained by New Brunswick apples at the Royal Horticultural Society's Show, London, England, Dec. 1-3, 1910.

N. B. Government—The Society's Silver Medal for 50 boxes of apples.

Randall Bros., Sheffield— Silver Gilt Kinghtian Medal, for 50 boxes of apples.

I. C. Gilman & Son, Fredericton—Silver Gilt Knightian Medal for collection of apples.

W. C. Staples, Douglas, Silver Knightian Medal for collection of apples.

J. W. Black, Maugerville, Silver Banksian Medal for collection of apples.

A. G. TURNEY.

Growing Rhubarb in the Cellar in Winter.

Most farmers who have a garden at all usually have a good supply of the old fashioned pie plant or rhubarb. This vigorous growing plant provides a wholesome substitute for fruit early in the spring before strawberries come in. It is not generally known, however, that it can be made to produce its crop in an ordinary cellar during the winter, when it would probably be more appreciated than when grown in the usual way in the garden in the spring.

The rhubarb plant makes its most vigorous growth under natural conditions early in the spring, when its large leaves store up in the thick fleshy roots a large amount of nutriment for the production of seed duringthe summer and growth eatly next season. To get the best roots for the winter forcing it is well to allow the plants to make their full growth with little or no cropping of the leaves the previous season, and above all not to allow them to exhaust themselves by throwing up seed stalks. The more liberally the plants are manured and the better they are cultivated, the stronger the roots become and the better the crop they will give when forced in the cellar.

In preparing the roots for the cellar, they should be dug up late in the fall, just before the ground freezes hard. They should then be left where they will be exposed to severe freezing for three or four weeks. If placed under cover in an open shed, or where they will not be buried in snow, it will be all the easier to get at them when it is time to take them to the cellar. About Christmas time they may be put in the cellar, and should be banked with earth to keep the roots moist. Care should be taken that the plants are set right side up, as at that season it is sometimes difficult to tell which side of the ball of earth the crowns are on. In the course of a few days the roots will thaw out, and usually enough moisture is thus accumulated to keep them fresh for some time. They should be watched, however, as they may need watering once or twice during the winter to keep the soil moist. The warmer the cellar, the more quickly growth will start, but for the best results a rather low temperature, about the same as that in which potatoes are kept is best. In a partially lighted cellar, the leaf blades will expand very little, and all the strength of the roots will go to the development of the stalks. If the cellar is light, it is well to darken the part where the plants are kept. If the roots are strong and vigorous, stalks one and a half to two feet in length and two inches in diameter will be produced with little or no expansion of the leaf blade at the top. When grown thus in the dark, none of the chlorophyl or green coloring matter of the leaf develops, and the stalks are bleached to a pinky white. When cooked and made into sauce or pies, they turn a beautiful pink color and are much finer in appearance and flavor than stalks which are grown in the ordinary way in the garden. Cropping may begin as soon as the stalks are well developed and may be continued for several weeks, until the roots have exhausted themselves, after which they should be thrown out, as they are of little use for growth again.

We would suggest that our readers try growing two or three roots this winter, and let us know the results next spring.

H. L. HUTT.

O. A. C. Guelph.

THE NEW EMPRESS STEEL RANGE.

The phenomenal sale of this Range in the Maritime Provinces is the best proof of its superiority over other makes. The owner of a NEW EMPRESS does not hesitate to recommend it to their friends or neighbors. Hence the result.

The large roomy 20-inch oven; the splendid heavily lined firebox (changed to burn wood or coal by a simple turn of the shaker crank) which takes a stick of wood 27 inches long when equipped for burning wood; the large working top; the tight fitting roomy warming closet and the left hand copper reservoir, holding 36 imperial quarts with the firebox between the oven and water are some of the features of this Range.

The EMPRESS is a splendid baker and the top being of a special cast will furnish plenty of heat—being superior in this respect to other Ranges with malleable tops.

POULTRY.

HORSEMEN ATTENTION!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. They cure Cough, Cold, Distemper, Colic, Glanders, Spavin, Pink eye and all diseases of the Horse.

TRURO, N. S.

Dear Sirs,—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse liniment. The cough was of twelve months standing. In my large expeience with horses, I consider this liniment to be the best made for all diseases of the horse, and I recommend it to my friends.
E. J. ANDERSON.

BEAR RIVER, N. S.

DEAR SIRS,—
We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it.
Yours truly,
CLARKE BROS.

Standard Breed Poultry for the Farm.

Editor Maritime Farmer:

It may appear somewhat strange to the poultryman of advanced ideas but it is nevertheless true that there are many farmers in Canada who do not think it worth while to put standard bred poultry on their farms. Many of the older generation will remember when, for instance, the Shanghai was looked upon as the sum of all excellence, in the poultry line, and many also remember how disappointed they were when it was found that the eggs of these big birds were but little larger than those of the ordinary scrubs, and even in some cases not as large as the eggs laid by some old hen of exceptional merit along those lines. Then the fact became apparent that the Shanghais were enormous feeders, and that, in winter, they were even more apt to have their toes frozen off than were the native bred fowls. Scant feeding was the rule, rather than the exception in those days, and the farmers were very sore that the big ones of the imported breed would not scratch for their living with the same energy and attendant success as would the native scrubs.

All these supposed defects were scored up against the Shanghais and when some enterprising poultry fancier introduced what was at first called Cochin China, his was hailed as a rare discovery. These birds, as at first introduced, were extremely attractive in appearance for they were tall and imposing looking and pure white. It was soon found, however, that they had the same supposed faults of their predecessors. They were very susceptible to the rigors of the Canadian winter and they were such poor "rustlers" that they were liable to starve to death unless they were decently fed during the winter months. In some respects they were even inferior to the Shanghais as they were tall and leggy, while the Shanghais were stout, broad shouldered and blocky, having a better shaped frame upon which to carry meat than the Cochin Chinas. The Buff Cochin China or "Cochin" as the breed had come to be designated as time went on, found favor for a considerable time, and it is without doubt a much better bird than either of those described, for the Cochin combined the rugged stoutness of the Shanghais with the smoother and more graceful outline of the White Cochin. Even now it finds favor with breeders of improved stock who are particularly anxious to produce heavy birds for the table

These early representatives of the improved breeds accomplished an excellent purpose, however, for they set poultry raisers thinking of the possibilities of improving their poultry stock. During recent years improved breeds have been multiplied until one would hardly attempt an enumeration of them, and few if any, of the breeds which have survived to the present day are without some distinctive merit, and which are not well adapted to the aims of some particular breeder.

The introduction of improved breeds has also served another purpose which has been of material value to the poultry industry. It has shown to farmers and others interested in fowls and egg production that liberal feeding, proper housing, and suitable care are all necessary to the attaining of good results, no matter what breed the producer may have selected. With proper environment the improved fowls always will give vastly better returns than will the scrubs, so much better, in fact that the farmer or poultry raiser of today who means to care for his fowl and feed them properly, will not waste his efforts upon mere mangrels.

The improved breeds of today are the result of years of brain labor, and painstaking experiments on the part of poultry raisers in all parts of the country who have studied the peculiarities of different breeds, even of individual birds, and have by the crossing and intensifying of different strains for the purpose of securing certain desirable types for special purposes effected radical improvements. They have produced strains for the table and strains for egg production; but without doubt, what the farmers most need in their flocks are general purpose birds. These are fowls which have constitutions sufficiently robust to withstand the severe strain of egg production, and at the same time sufficient size and substance to take on the maxium of flesh during the fattening period. These general purpose birds may not be the most successful in the show ring for the reason that they are not apt to be quite handsome and graceful enough to catch the eye of the judge who makes his decision on a scale of points into which such plain qualities as practical usefulness do not always enter. He holds that a bird of a certain breed must be of a certain weight, and if the bird exceeds that weight the fact counts against him. Then the prize winning bird must be graceful in outline and of smooth contour from comb to claws, but the practical producer places more stress on evidences of robust health and constitutional vigor. He wants a pure bred bird for he wants his fowls to breed true to type in all instances, but as long as he knows the bird is pure, and can be depended upon to produce his own kind in the next generation, he likes the fowl that is overweight all the better for his excess in that direction. A tall and imposing looking fowl may make a fine showing before the judges, but the practical producer will prefer the bird with broad shoulders, short stout legs, and a massive, blocky form. Such birds may not be as fine to look at as the prize winning types, but they have frames which will carry a great amount of flesh, they have grand appetites, big vital organs, and they are the birds which will go through the ordeal of crate fattening without turning sick, or even for an hour, going off their feed. Their thick, stubby legs may not lift them high off the ground, but they will prove strong enough to carry a heavily fattened bird, and one which will turn more feed into tender chicken flesh than will the most brilliant of prize winners.

It should not be bery difficult to prove that it would pay the farmer better to keep judiciously selected pure breds than scrubs upon his farm In the first place he must remember that in keeping fowls of some one of the improved modern breeds upon his farm, he is profiting by the experience and painstaking labors of the best informed poultry men of several generations. They have experimented, they have worked logically from these experiments and they have acted upon the conclusions they have obtained in this way, and it stands to reason that these conclusions, whose value has been proved over and over again in the history of poultry raising, must be of material value to the farmer who will accept and act upon them.

It does not take a very bright stockman to look at a rawboned Texas steer, and then at a purebred Shorthorn bullocks and declare that the Shorthorn is the better animal of the two. He sees the difference, but how has this improvement been accomplished? By the very same process which has developed the improved poultry breeds of today. By the painstaking efforts of many generations of stock breeders, who like the poultry raisers, have been crossing and selecting with one object in view, and then fixing the desired type.

When the English horse breeders began breeding race horses with a few Arabs and Barbs as the parent stock, a race horse that could run a mile in two minutes was a good one. Half a century ago a really high class race horse could run a mile in 1.46 A quarter of a century ago or there abouts Ten Broeck ran a mile in 1.39¾, but now Salvator holds the mile record at 1.35½. In his four year old form Ten Broeck in a race against time, ran two miles in 3.27¾ with 110 pounds up, but some ten years later or less, the great Australian horse, Carbine, also a four-year old, ran the same distance in an actual race, against a field of thirty horses, witn 145 pounds up, a crushing impost, in 3.28½, only three-quarters of a second slower, in spite of the immense difference in the weights carried.

All this has been accomplished through the efforts of experienced, intelligent and painstaking breeders and in the same manner through exactly the same line of effort, poultry has been improving during the past quarter of a century and the rich fruit of these efforts is being laid at the feet of the poultry raisers of today, yet men will ask if farmers ought to avail themselves of it!

Some farmers will ask if it would be wise for them to put upon their farms a breed of fowls which will eat as heavily as will the improved utility breeds of poultry of today?

The business of any animal that is destined to be killed for the market is to convert the greatest possible quantity of food into marketable flesh in the shortest time possible. Take a certain quantity of feed to be marketed as chicken flesh. If one fowl will do the work in ten days and it will take two others to do the same work in the same length of time, it is easy to see that the one heavy feeder will be more profitable to his owner than will the two light feeders, for the reason that the maintenance of two birds during the fattening period will be greater than that of one. In the case of the heavy feeder only one frame, the feathers and the offal of one bird, will be substracted from the feed instead of the waste products of two birds, and it will be remembered that this toll of support for the waste products must be extracted of the feed before an ounce of marketable flesh is made.

The foregoing are reasons in favor of the more general adoption of standard bred poultry which should appeal to the hard headed common sense agriculturists desiring to make the poultry end of their farms pay.

Pembroke, Ont.

Green Bone for Poultry.

Without fear of contradiction, I can safely say that no poultry plant however small, is complete without a Green Bone Cutter. The poultryman who is in the business of "poultry-for-profit," wants eggs—and egg production depends upon correct feeding.

An egg is composed of water, protein, fat and ash, and each one of these is found in green bone; no other food supplies these necessary elements so well. Green bone makes flesh, because it is rich in flesh-forming material. Green bone keeps the flock healthy, because it keeps the birds in vigorous condition, full of vitality and enables them to resist disease.

As a comparison of the egg forming elements of grain and those of fresh green bone, the following table tells at a glance the remarkable efficiency of green bone as an egg maker.

	Protein	Fat
Rye	10.6 p. c.	1.7 p. c.
Barley	10.4 p. c.	1.8 p. c.
Wheat	11.9 p c.	2.1 p. c.
Oats	11.8 p. c.	2.0 p. c.
Corn	10.5 p. c.	5.4 p. c.
Green Bone	22.3 p. c.	16.5 p.c.

A superficial study of the above table shows in a moment than as an egg producing food, green bone has twice as much protein as any of the above grains and three times as much fat. The poultryman who has been feeding grain and who starts feeding green bone, should practically double the egg yield of his flock, provided the bone be fed freshly cut every day.

The best green bones are those which are fresh, such as the butcher has left after cutting the meat. They are really not clean bone; some fat, lean meat gristle is left on them.

These bones can be readily procured at a butcher shop at a low price; one ounce a day for each fowl is sufficient.

Green bone is very economical to feed. One instance is related of a poultryman who imagined he must feed wheat, regardless of cost. He discovered, however, that by feeding cut bone, corn and bran, he got better results and saved 25 per cent. of his feed.

The expensive part of a hen's ration, is the protein or muscle-making food, which costs several times as much as the fats and the fat makers. The latter are most easily raised on the farm, the muscle-makers can usually be bought in bones, for half

what they would cost in wheat.

But green bone is more than an egg producer, it is also the best growth promoter and muscle-maker that poultrymen have yet discovered. Young chicks thrive on it; pullets and cockerels grow rapidly; cocks keep slick and laying hens maintain their vitality and health to a remarkable degree. The major part of poultry success, rests on the feed ration. You may have the finest blooded stock in the country, the handsomest hen houses, the best incubators and brooders and yet, if you neglect proper feeding, your work will show for nought.

Therefore, I maintain, that the bone cutter is the foundation of successful poultry keeping—of equal, if indeed not of greater importance than other appliances. Poultry amounts to little without eggs; and eggs are most easily and most surely produced by feeding fresh-cut, green bone.

The successful poultrymen, are those whose fowl do just a little better than the average. An extra egg every now and then, counts up. A farmer who gets two extra eggs per week from each hen, in winter, makes a profit. And green bone produces extra eggs.

Remember, the cost is low; a pound of green bone, costing a single cent, is sufficient for 16 hens for a day. In winter, one pound of cut bone in the morning and one quart of grain at night, is ample for 16 hens; in summer, the bone alone is sufficient, scattered over the ground and left for the hens to pick up.

Such diet provides fat, starch, nitrogen, phosphates, lime and all substances required to enable the hen to lay eggs.

It is plain that it is cheaper to feed bone than grain, as the greater number of eggs not only reduces the total cost, but increases the profits as well.

Moeover, green bone cut feed insures fertile eggs. The larger the percentage of fertile eggs put into the incubator, the more chicks and more money will come out of it. Fewer poor chicks prove their lack of vitality by dying in the shell.

Cut, green bone-fed broilers and fryers go to market earlier and bring better prices, at less cost for feeding. No other feed in the world pushes broilers like green bone.

Green bone pushes pullets to early maturity and makes them quick layers. Ducklings relish it and turkeys grow rapidly on it.

But the value of all foods, depends upon their digestibility; the more this is provided for, the greater will be the saving of food and the more economical the production of eggs.

To meet with success, requires the use of the best material; there is a big difference between the green, fresh bone, rich in its juice as it comes from the butcher, and the hard dry bone which has lost its succulence.—L. M. C.

THE HORSE.

Matching Horses for Teams.

There isn't anything more annoying or taxing upon one's energies and exasperating to his nerves than to be compelled to drive a mismated team, and yet how often we find such teams upon farms. Such a team makes the work harder and contributes to the difficulties of keeping good men. The mismated team is not only less efficient, but the man is also less efficient for doing good work.

If he is obliged to give his principal attention to his team he cannot perform the work he has in hand as well as if more attention could be given to the cultivation of a crop or the operating of a machine. If a team of horses is well mated and, agreeable workers, they are likely to receive better treatment by most men, thus making them of greater efficiency, as well as an inspiration and stimulus to the driver for more and better work.

A team is likely to be the closest companion of a farm hand, and with which he spends more time every day than any other. They demand more thought, more care and more patience, if he is a good driver, than any other living thing upon the farm. His temperament and spirits will be greatly influenced by them, depending whether or not he and they can work harmoniously.

A team with one horse fretting and fuming to go faster and rushing ahead at every opportunity, and with the other horse willing to take life easy, is anything but conducive to a pleasant frame of mind. There is solid satisfaction and encouragement for a man to do his best in driving a well-mated team that responds to good horsemanship.

If a horse is allowed or caused to needlessly waste energy through nervous excitement, he will have less with which to perform labor. A great many horses are caused to needlessly waste energy by being mismated in a team and chafing under restraint, or from bad management of a driver, or from suffering the torments of pestiferous flies. The urging on of a slow horse often irritates the fast one to a greater degree than the good accomplished.

Horses of the same spirit and working character should be mated together in a team, and then if they are both too fast their gait is easily steadied, or if too slow the necessary urging may be simultaneously administered to both. Those of approximately the same size and breeding are more likely to have the same temperament than a large horse and a small one. Horses of the same breed and same family are more likely to work agreeably together than those of different breeds or different families within the same breed.

If the horses are to work together in threes and fours the problem of mating them up is more difficult unless all the horses on the farm are a uniform lot. Such farms exist where the horses are uniform in size, and they bear testimony to the ideals of the proprietor. On these there is but little difficulty in mating three and four-horse teams that will work satisfactorily.

It may be necessary on some farms to sell some horses on hand and buy others in order that the teams may be properly mated. Where this is done the owner will add to the value of his teams by increasing their efficiency for doing work, make them more agreeable workers, and bring buyers to his farm who are looking for well-mated horses, always in great demand.

In mating horses size, conformation, type and temperament are necessary considerations, and should not be sacrificed for color, although this is also important. Two or more horses of the same color, providing they are of the same size and build, are always more attractive than harses of different color. A matched team catches the eye and calls forth admiration by horse lovers. Because of this fact they have a real value which a mis-mated pair do not have, even though they be equally as good individuals.

The harness also has an effect upon the appearance of a team, depending whether or not it is well fitted and appropriate for the kind of work the team is expected to do. Good horses deserve good harness, and a team with a well-fitted harness corresponds to a well-dressed man. Every part of the harness should be properly adjusted so as to cover up or hide any little defects in conformation the horse may have, and help to bring about the appearance of good proportions.

For instance, if the back is long the back pad should not be placed too far forward, if the coup is short the hip straps of the breeching should be placed well forward; if the thighs and quarters are deficient, a properly adjusted breeching helps the appearance very much. The size and shape of the head is greatly influenced by the fit of the bridle, and the carriage of the head by the adjustment of the check-rein.

A little brass mounting on the harness, which should and can be kept polished by a very little work each day, adds greatly to the appearance of the team. The mountings should not be too numerous because of the work entailed in keeping them burnished, but the mouot may be of good size, depending upon the weight of the harness. It is most effective when used on ball-top hames, terret rings in the back pad, buckle shields wherever needed and the brow band on the bridle, with a plain, large rosette.

If it desired to use more brass a drop decorated with buttons or initials may be placed on the front of the bridle and one in front of the breast; initials may be placed on the outside blind, and buttons on the nose band and the hip straps of the breeching. Where brass is used the prevalent danger is from using too much rather than using too little, and thus overloading the harness, and then not keeping it polished. It is better taste to have a harness oderately mounted than to have it overloaded.

Teams of well-mated horses, kept well groomed and neatly harnessed, reflect great ceedit upon thir owner, who is bound to be a strong factor in any community.—Farm and Home.

Pointers on Selecting Horses.

The good stallion has a high-headed bold, noble, masculine appearance.

Narrow, round hocks, from their insufficient carrying capacity, are subject to bone and bog spavin.

There is more danger of curb when a horse is sickle hocked.

Faulty surroundings in youth are the main causes for most of the unsoundness we see in horses.

Short, straight pasterns and cramped hoof heads go with side bones.

There is no such thing as a flat bone, as the term is used in relation to the horse. The cannon bones are round, and it is the tendon that gives the flat appearance.

The bone of a common range horse is much stronger than that of a well-bred, high-quality native horse.

Little Bits of Horse Sense.

The nervous horse should have less oats and more bran.

When a horse has free access to

DAIRYING.

C. W. McDougall, Dairy Inspector, staff Contributor.

Butter From Frozen Milk.

In a recent report Professor Hills gives the results of a series of experiments made to determine the effect of freezing milk on skimming, churning and quality of butter thus:

Partially frozen milk or cream are not uncommon receipts at creameries in northern latitudes. It is the general notion that the best products cannot be made, or at any rate, are not usually made from milk or cream which has been partially frozen. A somewhat careful survey of literature failed to disclose any published trials of this matter, and it seemed worth while to study it.

A series of trials, using the milk furnished by the station here, was projected for the winter of 1905-06. Unfortunately, this was the mildest winter in years and but fifteen trials could be made. One hundred pounds of milk were divided in each case into two lots, one of which was exposed to freezing weather for 12 hours or more, so that from a fourth of an inch to three inches of ice formed; while the other was handled in the usual manner. The minimum temperature ranged fram minus 15 to plus 24, being but twice below the zero point. A special small barrel churn, a special and small ripening vat and a small butter box were used. Every shipment —thirty in all—was sent to Bostoo for scoring and judgment. The station is under obligation to Orrin Bent of Baston, the veteran butter judge, for his careful attention to the scoring. Prior to shipment they were also critically examined by the writer, the station buttermaker and by Mr. Kibby.

The essential outcame of the trials is:

1. Milk, testing 5 to 5.50 per cent. fat, separated at 85 degrees F. Skim milk, frozen milk, .05; unfrozen, .05 per cent. The skimming was unaffected by freezing when the milk was again properly warmed.

2. Creams, running from 36 to 40 per cent. lat, on ripening developed an acidity which ranged from .40 to .72 per cent. and averaged .57 per cent. in the milk normally handled; and which ranged from .40 to .71 per cent. and averaged .57 per cent. in that which was subjected to freezing. Each churned at 57-60 degrees F. in 12 ta 25 minutes, averaging 16 minutes, with buttermilk averaging to test .25 per cent. fat (extremes .06 and .90 per cents.). The average weights of unsalted butter obtained were identical, 3.1 lbs. Ripening and completeness of churning were unaffected by freezing.

3. The scores at the outset were relatively low on each lot, difficulty being experienced in properly handling the very small amounts of cream and in adjusting the salt and color. This trouble, however, was common in both lots and does not affect the final outcome. The average scorings of the two sets of 15 lots each were frozen, 93.2; normal, 93.5.

Six lots from each were put in cold storage and scored a month and two months later.

It would seem that freezing the milk tended very slightly to lower the grade of the butter. The effect, however, was so slight as to be almost negligible—although in the more strictly comparable lots which went through cold storage the difference was a full point. It should be borne in mind, however, that conditions were better than those which would ordinarily obtain in creamery practice. The milk was received clean and fresh. It does not follow that the none too cleanly nor overfresh milk or cream, received at a creamery at infrequent intervals in a more or less frozen condition, often frozen for some days, warmed rapidly, but incompletely, would make as good a butter as if it had been delivered unfrozen. This trial, however, serves to indicate that freezing per se is not necessarily a serious menace to good buttermaking.

Breeding Dairy Cattle.

There are three essentials that we must bear in mind when we seek to breed dairy cattle of the highest class. They are: 1. The qualities that make a desirable animal. 2. Profitable production. 3. Reproductive ability. I shall consider them in the order named.

The qualities that make a desirable animal are usually expressed by the term constitution. Webster defines "constitution" as: "That form of being, or peculiar structure and connection of parts, that makes or characterizes a system or body." If breeders meant this definition when they use the term "constitution" it would answer admirably. As used by breeders, "constitution" indicates strength and the ability of an animal to maintain its general health and vigor and its productive and reproductive powers unimpaired to a good old age. The score card points allotted to "constitution" are merely those indicative of physical health and strength.

Thus it would seem that the qualities that make a desirable animal express my meaning more clearly. I shall not attempt to describe the typical form of the dairy cow, but the man seeking to become a breeder must always study the animals about him and fix in his mind the essential points until he can analyze an animal at a glance. Until he has a definite and desirable type in his mind and selects his cattle to conform to it, he will not produce uniformly good cattle.

It is far easier to secure good prices for well-formed attractive cattle, and form is the only visible indication of performance. Whenever you find a man selectiog, breeding and caring for his cattle intelligently you will find a herd returning a large profit But when you find a man who is indifferent regarding these things, you will find a herd that returns, at the best, a very small profit. The great secret is in the individuals of the herd; in every herd there is an enormous variation in the production and profit of the different cows.

There is only one way to secure the highest profit from your herd; and that is to know what each cow is doing and to keep the best. The cow testing associations under the control of this society furnish the best way of doing this work. The breeders of pure bred dairy cattle in this state are missing great opportunities when they fail to do everything possible to organize such associations in their own neighborhoods.

If you desire to build up a permanent herd and to receive enduring benefit from your work of testing and selecting you must seek for reproductive ability. Hitherto I have said nothing about the relative merits of scrub grade and pure bred animals. While the scrub cow may have productive ability and be a fairly desirable individual there is little chance that she has within herself the power of producing offspring with her good qualities unless she is mated with a bull capable of transmitting those same qualities. Mated with a bull of her own class, her merits will be great indeed if she can impress them upon her offspring. Among grade cows of the established dairy breeds, desirable individuals and profitable producers are as a rule rather than the exception and when mated with pure bred bulls of their respective breeds these qualities are usually reproduced. Mated with grade bulls, like themselves, the tendency to revert will produce a mixed offspring—some good and some bad. In pure bred herds, we expect to find the desirable qualities and productive ability reproduced with certainty.

You may conclude from what I have said regarding the comparative reproductive abilities of scrub, grade and pure bred animals that the pure bred is always desirable. A pure bred should be pure, not only in the sense of being eligible to registry, but purely bred because it is free from the blood of unproductive ancestors. In testing a pure bred herd we will find about as wide a variation as in any other herd, but in good herds it varies around a far higher average. We will also sometimes find that the daughters and granddaughters of some certain animal will group themselves together and whole families whose production is uniform and far above the rest of the herd. When a breeder finds a family of this sort he should devote his energies to developing it for he has a firm foundation on which to build. Such families are

WINDSOR DAIRY SALT

"Expect to get the prize for the best butter, this year?"

"Of course I do.

I have the best cows in the country—and here's my Windsor Butter Salt.

You can't beat that combination.

You know, I have won first prize for the best butter ever since I began to use Windsor Butter Salt"

"Hope you win"

"Thank you, so do I" 41

Gold Rings Free

A Ladies' or Gents' Fine 14k. Gold Filled Rings Free, for selling 5 boxes of Dr. Marcil's Compound Pills at 25c. a box. They are the greatest remedy on earth for the cure of weak and impure blood, nervousness, constipation, stomach trouble, to stimulate the appetite, regulate the bowels and clear the complexion. A grand tonic and life builder. You will sell them very quickly, as each customer who buys a box from you at only 25c. can receive a handsome present of a Broach or Cuff Links or Ring. Send us your name and address and we will send you post paid only 5 boxes of our remedies to sell at 25c. a box. When you have sold them send us the money, $1.25, and we will send you your choice of any ring immediately. We are giving these rings to advertise our remedies. Don't miss the chance of your life. Every Canadian Farmer Wants The World's Best CREAM SEPARATOR

When you have a Sharples Dairy Tubular Cream Separator you have The World's Best. You can then say to your friends, "See my Tubular. It is later than, entirely different from and vastly superior to all others. It produces twice the skimming force of common separators, and skims faster and twice as clean. It makes profits for me which no other separator can make. My Dairy Tubular contains neither disks nor other contraptions, because the double skimming force makes such contraptions needless. My Tubular is the simplest, easiest to clean, most durable separator ever made."

Will you not be proud to own a separator you can speak of like that? It is a credit to your judgment.

Sharples Dairy Tubular Cream Separators

ARE GUARANTEED FOREVER by the oldest separator concern on this continent and the largest in the world. The manufacture of Tubulars is one of Canada's leading industries.

the real source of all improvement in breeding.

The great cow that springs from an ordinary ancestry and whose descendants fail to inherit her greatness is a damage to any breed because breeders will pay high prices for her sons only to learn after costly trial that she dis not possess reproductive ability.

What I wish to impress upon you is that, first, you must have a clear conception of the best types of the breed; then, you must test them to learn their productive ability; finally, you must always seek in your own herd for high producing cows of superior type and performance. Not all of us can expect to discover strains equal to the Glenwood Girls, Bonnie Lassie and Yeksa families, but careful testing will bring out many equally good, every breeder will find plenty of strains worth developing if he will only look for them. There is no lack of good material to work on, but there is a lack of the patience and perseverance that it takes to wait for a family to develop.

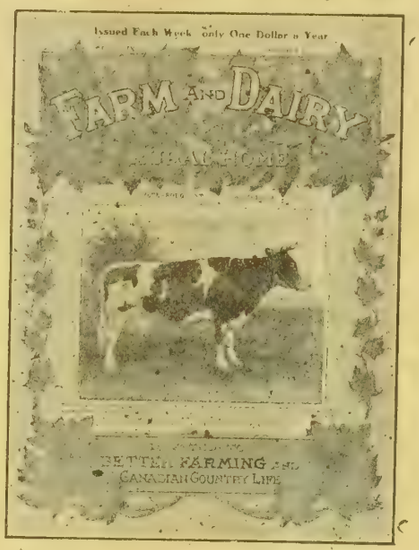
Many writers in the agricultural press are fond of referring in a mysterious way to the secrets of the great breeders, "how they mould the animal form to their will," etc., etc. These writer rarely make a sensible attempt to go behind the veil that guards the holy of holies and create an impression that the successful breeder has in some way obtained an uncanny knowledge that is beyond the ken of ordinary mortals. Some of the old time breeders encouraged this belief and it has grown until it is surprising how many sensible people believe it. As a matter of fact, I do not believe that any breeder that ever lived had any mysterious secrets about breeding that were worth knowing or ever succeeded in any other manner than by knowing exactly the sort of animals that he wished to produce and by breeding to the strain that he knew would produce them. Do not think that I wish to belittle the great breeders of an early day or that I undervalue the work that they performed. There is no question but that some of them attained a really marvellous knowledge of animal form and that they established strains whose reproductive ability was wonderful. We have little records of their work, but the thing that has impressed most people is that practically all of them practiced inbreeding. From this the belief has grown that it was the greatest factor in this work. We must remember that they had but a limited amount of material from which to choose breeding animals. They knew the value of reproductive ability and that a strong outcross of unsuitable blood would shatter the results of their labors. Thus, in order to retain this reproductive ability they mated close relatives together. Many of their later followers, ignorant of the real principle that governed them, mistook the method for the principle.

Charles Darwin probably studied inbreeding more closely than any other man. He decided that, while cattle were not particularly susceptible to the evil effects of inbreeding, when close and long continued it resulted in a loss of vigor and fertility. It is probably a good plan for a breeder of experience to experiment carefully with inbreeding; whether it is advisable in any case can be determined by trial.

In all the dairy breeds there are many families combining all three essentials in a high degree of perfection. We should look to these families for our bulls and labor to produce the right sort of females from our own herds to mate with them.—J. D. Clark, in Kimball's Dairy Farmer.

Good Times and Greater Profits

have been made possible to those **Farmers** and **Dairymen** who read **Farm and Dairy**—that **WEEKLY** farm paper, published at Peterboro, Ont., and about which the dairy farmers, who know it, are all talking.



It is a real surprise to learn what great value Farm and Dairy gives to its subscribers, who get the paper **52 times** in a year, included along with which they get also **Eight Enlarged Magazine Issues** and **Several Illustrated Supplements—all for only $1.00,** as mentioned in our advertisement in the last issue of the Maritime Farmer.

GET ACQUAINTED NOW.

Farm and Dairy, published **Weekly,** gives its readers full measure. It is a paper ably edited, up-to-date in attractiveness, in illustrations, in timeliness, in fighting the farmer's battles and in keeping him informed of what is going on in the agricultural world. Farm and Dairy is worth dollars to you. Get acquainted with it now. Start your subscription with the New Year. Write this evening to Peterboro, Ont., and ask us to send you a copy of Farm and Dairy. If you mention this advertisement, we will send you free also a copy of one of our Magazine Numbers.

Prof. G. E. Day.

THE BEST FARMERS IN THE LAND

write articles for Farm and Dairy. During the last two years we conducted a provincial **Dairy Farms' Competition** in which the best farmers in Ontario competed. These successful farmers, of known worth, are now writing for Farm and Dairy, telling how they farm, how they make money out of special farming and out of dairying. You may know **how these men farm and make money**—read Farm and Dairy this coming year, and **learn about them.**

Besides the men whose photos are here shown we have a host of Dairy Authorities, Practical Farmers, College Professors and Scientific Men who will give you of their knowledge through Farm and Dairy.

Christmas on the Old Farm.

By George T. Edson.

The mist veiled sun, just peeping through the hedge,
Gleames on the snow, now fallen in the night,
Paving the road for jingling sleigh and sledge,
Robing the buildings with a sheet of white.

A chime of village bells comes far and clear,
Ringing in tones of joyousness and praise;
Filling the air with sounds of Christmas cheer,
Pealing an anthem to the day of days.

The farmer goes about his morning chores
Feeding his stock and turning out the cows
Carrying straw to bed the pigpen floors,
Feeding with warm skim milk the grunting sow.

The children run about their wonted tasks
Bringing in wood to fill the open grate,
Before whose blaze the grateful tabby basks,
Stretching in quiet leisure by her empty plate.

The housewife plies her skillful practiced art,
Loading the table with the viands warm;
Molding and baking pudding, pie and tart,
Filling the cupboard with food in every form.

The father dons his better clothes, and rests,
Listening to hear the sleigh which soon arrives
Bringing his sons to be his Christmas guests,
The merry children and the happy wives.

Around the laden board they gather in
Steaming with savory roast and pumpkin pies,
The banquet puzzles as to where begin,
Yet where to quit a puzzling thought supplies.

The dinner o'er they find accustomed chairs
Around the hearth and each one talks and jokes
About his visit or his home affairs,
While he who cares for pipe, contented smokes.

How ample all the cribs and frugal stores
The farmer shows for labor fairly done
An honest bounty for his cares and chores,
A treasure truly and deservedly won!

What e'er he has he feels was fairly earned,
That no man lost to his ignoble gain
Dame Nature smiled upon the furrows turned,
And for his toiling gave him yellow grain.

Around such homes our nation's pillars rest,
From hearths so warm our country's builders go,
With liberty strong-nutured in each breast,
The fountain head from which our glories flow.

Wilma's Christmas tree.

Tomorrow is Christmas Day!"

Wilma stood dejectedly at the uncurtained half-window of the little claim-shack, looking out upon the wastes of brown grass stretching away, for miles and miles, almost without a break. "Almost," for a mile away, the earth-covered roof of a dugout showed, but it was vacant. The family, Wilma's only neighbors, had moved into the nearest town for the winter's school.

Last year it had all been so differ-

Wilma could picture the reunion at Grandma's with her away. There would be the bundling up in the sleighs for a ride over the snow, the mysterious gifts, the whispering in corners of happy secrets, the big Christmas tree, the coasting and skating parties, and the great dinner, in the big dining room.

This year, she had sent her little gifts by mail. Not very much, it seemed to her. She had sent Grandma her copy of "Snowbound," and for Grandpa she had made a spectacle wiper, of chamois skin. And away out here she could not have a sleigh ride, for there was no snow! No snow, and not a hill to coast on, and not even a little pool, even if it might freeze, to skate on! And not a bush or a shrub big enough for a Christmas tree! Wilma's head, with its neat flaxen braids, suddenly went down on the rough sill, to let the tears, kept rebelliously in check so long, have free flow. A sudden thought caused her to lift her face a few minutes, hastily wiping her eyes, and the upturned tip of a fast reddening nose.

"Suppose Mother were homesick.

She remembered, now, that Mother had not sung, as usual, that day as she went about her work. She had worked with her customary briskness but had gone about so quietly and listlessly! But that might be because Father had gone to town. Mother was always very quiet when Father was away.

Just then a flock of little brown-and-gray birds settled on the ripe weeds below the window, and Wilma cried out in delight, her loneliness for the moment forgotten.

"Oh, Mother! I never saw so many birdies at one time in my life! Do come and see! There must be a thousand!" with the exaggeration of excited childhood.

The mother looked up from the beans which she was putting in an earthen pot to bake. "Yes, it is goint to storm, I fear," she answered. "If your father does not come home to-night, he will not be able to get home, I think."

Wilma looked at the sky and noticed for the first time the ugly clouds that were scurrying up in all directions. In this land, where the sun almost always shone, especially in winter, it was strange that she had not noticed them before. Suppose that Father did not come home that night? He would not be able to spend Christmas with them at all. And suppose he started, and was not able to be there before dark, and the storm overtook him? Wilma knew what it meant for a man and team to be lost in the "breaks." There would be the wandering for hours, where all paths loaked alike, the cold and the storm, and then— a swift plunge over some cliff-wall, and she shuddered and turned so white that her mother noticed it, and called her to help with some little house hold task, to keep her occupied. And so the time passed, until the early darkness came.

The mother put a light in the little window, and they both saw that there was plenty of coal and kindling, and a bucket of water, but both hoped that Father had not started home that night, for the thick mist was chilly and raw and fast turning to sleet, with a sharp wind coming up from the northwest, blowing "straight from the pole," Wilma said with a shiver, as they closed the door.

There was no use to try to sleep, so the folding-bed was not taken down, but mother and daughter tried to forget the night and the storm, by reading aloud from "Rab and His Friends," a favorite of the little girl's. The storm grew worse and worse.

About ten o'clock, a shout right at the corner of the house brought them both to their feet, and now they ran to open the door and stir up the fire and help put up the horses!

"Why, Father!" cried Wilma, "How did you dare!

He laughed.

"Well, you see, I found a box from Grandma waiting for us at the freight-office, so I did not wait for that train. Then I got part way home, and the storm was coming on so bad, I had a mind to stop at that place the other side of the breaks, where those German people live, for I was almost afraid to try the breaks in the storm. Just as I was about to turn in, I saw a light ahead of me, and I knew it was a camping-party in the breaks, so I knew which road to take, and soon I saw your light, and the horses came right on, without any trouble."

When morning dawned, it was a strange world that met their eyes. Every weed was weighted with ice, bending low in sheeted mail. The ground crackled as they stepped upon it, and the roof sported icicle stalactites. The big box had received due attention, the oatmeal an canned milk had been disposed of, and Wilma started to feed her pet chickens, which did not usually need any food, where there was so much to pick all around them. She noticed the little birds, now sorrowful little drooping balls, sitting disconsolately under the eaves, and the icy corners of the corral. A happy thought sent her racing back over the crackling way, and for a minute her words tumbled over one another, in the effort to be first out of her mouth.

But Father and Mother understood, and a big soap-weed was cut for a "tree-trunk" to which big "tumble-weed" branches were tied on. This was stuck firmly in the ground by the window, and Wilma made baskets of paper, as she had learned in the kindergarten, "way back East." Filled with choice bits of the things birds like best, they were fastened all over the "made-up" Christmas tree, and it was not long before a bird found it, and told the rest, and what a Christmas dinner they had! Wilma could hardly eat her own dinner, for watching them. And, somehow, she forgot her loneliness, and had so good a time that she decided to keep her "Christmas-tree" all winter, hung with tiny baskets. But much of the time, the birds paid it scant attention, for the ground was bare through most of the winter season. Only when a storm came, was Wilma's Christmas tree patronized, but then the little brown-and-gray birds came in flocks and feasted.

And, with the paints, and the books, and the pretty bright silks and the beads to string, that came in the big box, Wilma had so much to do that she had no time to be homesick again that winter. And before another winter, neighbors came, so that a little sod schoolhouse was built, and Wilma went to it, all the sunny days, so of course, you know, she wasn't ever homesick any more!

But she kept the Christmas tree set for the birds, that winter, too.

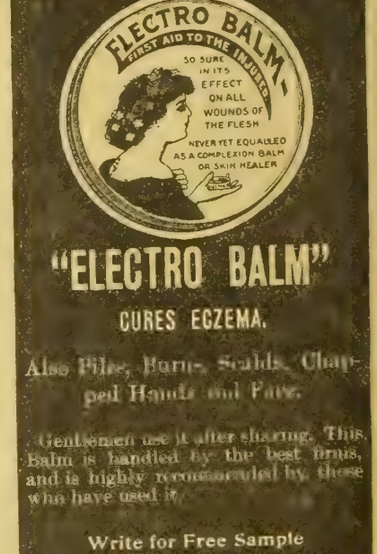
She says she means to keep one, every winter, until she's an old, old woman! And, as she is only eight years old, that will be a very long time indeed, and I think, before then some other little girl or boy will decide to do the same thing—don't you)

Guymon, Okla.

Consumption Book FREE

This valuable medical book tells in plain, simple language how Consumption can be cured in your own home. If you know of any one suffering from Consumption, Catarrh, Bronchitis, Asthma or any throat or lung trouble, or are yourself afflicted, this book will help you to a cure. Even if you are in the advanced stage of the disease and feel there is no hope, this book will show you how others have cured themselves after all remedies they had tried failed, and they believed their case hopeless.

Write at once to the Yonkerman Consumption Remedy Co., 1622 Rose Street, Kalamazoo, Mich., and they will send you from their Canadian Depot the book and a generous supply of the New Treatment, absolutely free, for they want every sufferer to have this wonderful cure before it is too late. Don't wait — write today. It may mean the saving of your life.



ELECTRO BALM

The greatest danger from influenza is of its resulting in pneumonia. This can be obviated by using Chamberlaib's Cough Remedy, as it not only cures influenza, but counteracts any tendency of the disease towards pneumonia. Sold by all dealers.

Contracted a Heavy Cold.

It Became a Lung Splitting Cough.

Mr. J. H. Richards, 1852 Second Ave. East, Vancouver, B.C., writes: "Allow me to write a few lines in praise of your Dr. Wood's Norway Pine Syrup. Last fall I contracted a heavy cold which left me with a hacking cough and every time I would get a little more cold this hacking cough would become a lung splitting one. It kept on getting worse and I kept on spending money buying different cough remedies until a friend asked me if I had ever tried Dr. Wood's Norway Pine Syrup. I told him I was willing to try anything I thought would cure, and on the same day bought two bottles. Before half the first one was used my cough began to get much easier, and by the time I had used a bottle and a half my cough was gone. I am keeping the other half bottle in case it should come again, but I am sure I have a positive cure. Let me recommend Dr. Wood's Norway Pine Syrup to all who suffer from a cough or throat irritation of any kind."

So great has been the success of this wonderful remedy, it is only natural that numerous persons have tried to imitate it

Don't be imposed upon by taking anything but "Dr. Wood's."

Put up in a yellow wrapper; three pine trees the trade mark; price 25 cents.

Mrs. Bowen's Parlor and Spare Bed-Room.

(Continued from last issue.)

"Yes, I believe I must be going; Mrs. Toby's at our house to tea, and I'll have to walk home with her, as her husband's gone to New York. Them boys of mine is never to be found of an evening."

Mother Bowen glided peacefully down the quiet current of her sheltered life and fell asleep at last in the pleasant room which she had come to call "The Chamber of Peace." It was a spare-room once more; but it was brightened forever after by the recollection of her grateful acknowledgement at the last, of the many cares and attentions she had been surrounded with.

Mr. and Mrs. Bowen liked quiet now, when evening came, and established themselves more frequently in the sitting-roam, leaving the parlor to the young people. Lucy Allen, the minister's daughter, came in very often, for she was engaged ito John, and they were to be married as soon as his first year's partnership with his father had expired. All the young people liked to come to Mrs. Bowen's, and to borrow the new books and magazines they were sure to find there, and, at the Sewing Society, Kate was the one appealed to in any discussion about plain as well as fancy work. Her own work basket was pretty full, too, for there were whole pieces of cotton and linen cut out and piled away in empty drawers of the spare bedroom. Young Dunbar's saddle horse, and dogs, and flute had been brought into requisition for Miss Kate's service uselessly, to the great wonder and envy of Miss Green, the lawyer's daughter, who would have said "Yes," with half the besieging to so many thousands a year. Kate had said "Yes" to a much poorer man, and probably never would ride in her own carriage, but her father and mother were satisfied. Mr. Allen said he had a noble head and heart, and as to family, it was all that could be asked.

Mrs. Gerry came over to see if it could really be true, when she heard that Kate was engaged to "that young Arnold, who was boarding with his mother at the Plumville House, last summer."

"Mary Jane heard it at the dressmaker's last night," said Mrs. Gerry, "and I put on my bonnet the first thing this morning, and run right over. It didn't seem possible. Why, I heard his mother only just had enough to live on, and he hadn't got fairly started yet."

"Mr. Bowen thought he might as well give them a start as to have all the wear and worry of a long engagement. We shan't need a great deal ourselves, with ,John married and Katie gone, so her father thought she might as well have part of what was coming to her."

"Well, well, I only hope it'll turn out all right"—and Mrs. Gerry drew a long sigh; "but my experience ain't very encouraging. It seems to me that we haven't had anything but trouble since the children began to grow up after all our working, and working, and slaving for them. There is Sam—you know how he went off, because his father wouldn't take money right out and out, and set him up in business—I don't suppose we shall ever see him again; and he doesn't seem to get along very well, somehow, I don't know why."

Mrs. Bowen knew, and all Plumville knew, that his idle dissipated habits were what returned him a burden on his father from everything he attempted to do; but she thought silence the truest sympathy on this point of her old friend's domestic troubles.

"Besides all we have to do for Sarah and her husband. She would have him, you know—you might as well try to stop the ocean—and there she is, with poor health and two little children, and he off spreeing round the country half the time."

"You have Mary Jane, though," Mrs. Bowen said as pleasantly as she could, for it se?med veryhard to have nothing bright to turn to, with all Mrs. Gerry's lifelong self-denial and hard work.

"Yes, but she ain't much help. All she cares about is being dressed up and parading the streets. Why, that silk dress of hers and velvet cloak cost more than fifty dollars! Just think of it! when I wore my brown merino eight winters, and it only cost me ten dollaes to begin with, fringe and all! She doesn't seem to get invited round much, though; I don't see how in the world it is. Some folks' children seem to turn out well, and some don't. It's all luck, anyhow."

She could not see poor soul, but her shut-up pgrlor and empty guest-room were daily witnesses against her, though they still preserved the faded remnants of their ancient splendors, and Mrs. Bowen's had been refurnished years before.

THE END.

A Christmas Gift Worth While

Backed by a GILLETTE Safety Razor, your Christmas Greeting of Good Will will be renewed every morning for years to come.

No article of personal use gains quite such a hold on a man's affections as the keen, business-like little GILLETTE. Daily, in three minutes, it transforms him from a man uncouth, ungroomed, into a clean-cut modern man of action.

So easy, too! No honing—no stropping—no cautious working round the awkward corners of his face. **He just picks up the GILLETTE—and SHAVES.** It slips through the stiffest beard with never a pull, never a gash. Any man can shave with a GILLETTE the first times he tries.

Handsome as a piece of jewelry, and a real, every-day, time-saving comfort, the GILLETTE is a Christmas gift worth giving—and worth getting.

Your hardware dealer, druggist or jeweler can show you a splendid selection of GILLETTES. Standard Sets, $5—Pocket Editions, $5 to $6—Combination Sets from $6.50 up.

The Old House.

One farmhouse old, with gables gray,
Round which the woodbines droop and cling,
Where swallows twitter all the day
And russet-coated robins sing,
I cross your threshold worn and old,
Half hidden by the tangled grass,
That seems to think my footsteps bold,
That nods and shivers as I pass.

How still and lone the empty room,
No voice to speak a kindly word,
No laugh to drive away the gloom
Where often happy echoes stirred.
When, in the far off long ago,
Glad footsteps rang along the hall,
And voices spoke in accents low
The words most dear and sweet of all

How bare and cold the lonely hearth
Where happy faces once were seen
And voices rang in merry mirth
The cheerful song and jest between;
Where are the ones who gathered here
'n that glad, happy time af old?
Ah, me, no answer greets my ear.
All lonely, silent, bare and cold.

Here sat our mother, tender-eyed,
The peace of Heaven in her sweet face;
We used to linger at her side
And count this spot a hallowed place
How lonely seems the empty room,
Where mother's face no more I see;
Perhaps from out the shadowy gloom
Her loving spirit looks on me.

Here father sat at close of day;
I see his kindly features yet;
Though he has gone so far away.
Beneath the churchyard's flowers and grass
His face was hidden long ago,
Where daisies watch the sunbeams pass
Across the graves so green and low.

How sad, how still. The churchyard's gloom
Is not more sorrowful than this;
Dead faces haunt the empty room—
The farms and faces that I miss;
They wisper to my lonely heart,
The unbidden tears will fill my eye;
The years have drifted us apart—
Old lonely, lonely house, good-bye.
—J. McGlennon, Northumberland County, Ont.

The Mother who gets no Letter,

Thousands of sons and daughters there are who are away from home living their own lives. Some are earning their own living; some are married; all are busy with their own concerns. And, unconsciously, they have forgotten their mothers. At least their mothers think so, and how can they think otherwise? For their children do not write. The mother looks every day for a letter, but the postman's hand or the postbox in the country store is full of other things. The mother says nothing, for silence is the badge of the suffering mother; but she unconsciously thinks back over twenty years and more of pain and care and self-sacrifice, when there were nights without sleep, and weeks of nursing, when social pleasures had to be put aside for the children's sake and a hundred economies had to be practiced that the children might be clothed and educated, when her whole life was devoted to the children, and the silence is pretty hard to bear.

Of course the mother makes allowance; a mother always does. "The children forget," she says. "Their lives are full, and they do not think how small and empty mine is." And she thinks to herself that some day their children, when they have children who have left them, will understand. Mothers are so patient!

All the same, a letter is so small a thing. True, that is why it does not get written. But it gives such pleasure, such heart satisfaction to a mother. And the mother-heart does rejoice so when she feels that though her children are far away from her, and no longer need her, they still think of her—and show that they do in the only way they can. Put yourself in her place, you son or

Scaring the Children.

One of the rights of young children is to be protected from unnecessary fright. They are entitled to this protection as they are entitled to be guarded from falling down the stairs They come into our life with a beautiful confidence that this is a friendly world. They are as unconscious of alignity as they are of gravitation. They are not naturally afraid of people, or of the dark. Then some body scares them. Somebody tells them that the hobgoblins will catch them if they don't watch out, and the simple joy of life is spoiled. Sometimes it is done by a foolish threat, sometimes by a ghost story, or by a picture in a book. Folks who do this sort of thing deserve a name which appears a dozen times in almost every chapter of the book of Proverbs. They belong among the mischief-makers who say afterwards that they did not know it was loaded.

Ghost stories are not for children, and parents should get this truth into their heads. The temptation to tell them is in the evident response which they awaken in the hearer; they are immediately effective. But they are survivals of the terrors of primitive persons, and they change, for sensitive children, the aspect of the world. They hurt like a wound.

The same is true of the threats of various kinds of torture which some mothers use as aids to dicipline. Their first effect is to frighten the children, but their second effect, which follows shortly after, is to assure the children that their mothers do not mean what they say, and that they are like barking dogs which do not bite.

Christmas Cheer.

In a little while, the thing we call the Xmas. spirit, will sweep across the world, lifting for a beautiful day, the cold prose hearts of men into a generous warmth. At this time of year—the time of "Peace on Earth, Good Will Toward Men"—we are moved to practise the little courtesies of love; our hearts are softened by the spirit of good cheer that prevails in the home, on the streets and in the business world. We seem for the moment to realize the eternal truth, that the only joys that remain permanent, are those we share, and that happiness is not obtained by storing it, but by spreading it far and near.

Making life pleasant for others, by sowing seeds of kindness, helping to bear their burdens, scattering a little sunshine over a broken spirit, wonderfully increases our capacity for enjoying the blessings that fall on us. Let us then hold fast to that which is good in Xmas—to the love the rememberance, the generosity. Let us cast off this hardened shell and give to humanity the sympathy, the encouragement, the appreciation it deserves. Let us give to the world the best we have, that the best may come back to us.

AUNT BETTY.

daughter, far away from the old home; think of how little comes into that home, and then fancy how big an event would be a weekly letter from Mary or John in the city! It is so worth doing—this writing to Mother while she is still where letters can go to her. It won't always be so, you know. So many there are who would give their all just to be able to write a letter to Mother. You can—yet!

HELLO!! HELLO!!! Lend us your ear for a minute or so.

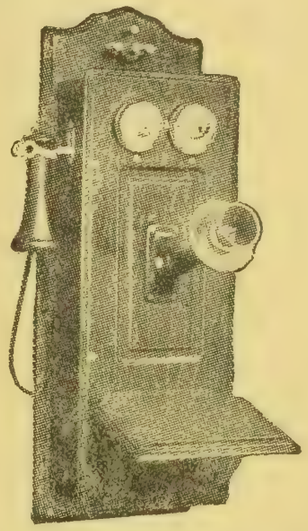
We hear that you are going to build a rural 'phone line in your locality and enjoy the benefits of telephone-served districts. We commend you for your enterprise.

But lend us your ear for a minute or so. Listen while we advise you that you'll find the most satisfactory arrangement is an **Independent System.**

With an Independent System you own the telephones and equipment outright, instead of paying an exorbitant yearly rental to the trust. You soon save a great deal of money.

But send for our No. 2 Bulletin which gives complete information about building and operating a telephone line.

With the No. 2 Bulletin we will, if requested, send you our handsome new book, "Canada and the Telephone" For this book a leading artist has drawn thirty-two pictures, illustrating the necessity and benefits of the telephone in rural districts.



If your system is already in operation ask us to send two or three of our telephones for free trial, so that you can compare them with others We welcome comparison tests for our 'phones, because we are sure of their superior quality.

We make prompt shipments of all kinds of telephone equipment.

Concrete Work in Winter.

The approach of winter makes timely a few suggestions as to the care and protection of concrete work done during freezing weather. It is a well known fact that freezing delays the development of strength in green concrete, and that permanent weakness results if concrete is subjected to alternate freezing and thawing. For these reasons the farmer is advised against attempting concrete construction during freezing weather, unless he is willing to take the proper precautions.

If the materials are mixed while heated, and the work is protected for a week or ten days while the concrete hardens, satisfactory work can be done regardless of low temperature. All materials excepting the cement must be heated, if at all possible; where the sand and gravel are not heated, these must at least be free from frost, and hot water must be used. Heat is essential, as it hastens the time of setting, and keeps frost away from the work until it can be protected. A small amount of salt is sometimes used in the water to lower the freezing point of the concrete, but this practice cannot be recommended, as the salt is apt to appear later on the surface of the work, making it unsightly.

For heating sand and gravel, an old piece of iron pipe, 12 to 14 inches in diameter and six to eight feet long, or a small furnace pipe be used. This is laid along the ground, and a fire placed within. A considerable quantity of material may be heated by placing it around the outer surface of the pipe. The furnace can be made of materials more readily obtainable and may be more handy to use than the pipe. A piece of No. 20 gauge corrugated sheet steel, supported on three sides built of bricks, rocks or concrete blocks, will make a suitable drying furnace. The furnace should be about twenty-four inches inside width, and at least six feet long. Two furnaces should be provided so that the sand and gravel may be heated simultaneously.

After the concrete is placed, the top of the work should be covered with straw or manure and unless the forms are of heavy lumber and fit tightly, these must be protected by being covered with canvas, manure or straw. As concrete made in winter weather acquires strength but slowly, it must be carefully looked over before the forms are removed and a load applied. Careful examination is often necessary to determine whether the concrete is really hardened, or simply frozen.

If concrete blocks are made during freezing weather, the work must be done indoors, with warm materials. While curing the blocks must be protected against freezing by being covered with straw or better still, the temperature of the storage should not be allowed to drop to the freezing point. Blocks made during cold weather must not be used in the wall for several weeks.

A sprained ankle will usually disable the injured person for three or four weeks. This is due to lack of proper treatment. When Chamberlain's Liniment is applied a cure may be effected in three or four days. This liniment is one of the best and most remarkable preparations in use. Sold by all dealers.

Unless you treat your ailments in the right way, you can't expect to cure them. We'll buy a 50-cent bottle of Psychine (pronounced Si-keen) from your druggist and give it to you free to show you how effective is the right way.

It's not so long ago that the doctors bled a man to make him strong.

"Stuff a cold and starve a fever" is miles behind our to-day's knowledge of curative science, yet our fathers had it preached to them time and again.

You may not know it, but to-day there are just as ineffective methods of cure being preached and practised.

All because most people do not know the real cause of disease.

There are two kinds of corpuscles in the blood—red and white.

The red corpuscles contain nutrition, the white destroy disease germs.

If for any cause the white corpuscles become depleted and are not sufficiently strong to destroy the germs of disease, then disease controls the body.

That's the cause of disease.

* * *

Years ago certain herbs were found to cure disease.

They didn't know how or why in those days, they do to-day.

And it's because these herbs build up the white corpuscles.

These herbs are contained in Psychine—they're responsible for the great results obtained from Psychine a third of a century ago.

They're responsible for the hundreds of thousands that Psychine has cured since that time.

It is because of these herbs that we have received hundreds of thousands of testimonials attesting to wonderful cures that Psychine has made.

And it's because of these very same herbs that we will buy within the next twelve months hundreds of thousands of 50-cent bottles of Psychine and give them away free to whomsoever sends us the coupon in this announcement.

Now if you wish to relieve or prevent any of the disorders in this list send in that coupon:

La Grippe	Bronchial Coughs
Bronchitis	Weak Lungs
Hemorrhages	Weak Voice
Sore Throat	Spring Weakness
Anaemia	Early Decline
Female Weakness	Catarrhal Affections
Indigestion	Catarrh of Stomach
Poor Appetite	Night Sweats
Chills and Fevers	Obstinate Coughs
Sleeplessness and	Laryngitis and
Nervous Troubles	Dyspepsia

After-effects of Pleurisy, Pneumonia and La-Grippe.

Now, we don't ask you to take our word for the tremendously beneficial effect of Phychine. Fill out the coupon below, mail it to us and we'll give your druggist an order (for which we pay him the regular retail price) for a 50-cent bottle of Psychine to be given you free of cost.

We will undoubtedly buy and distribute in this manner, hundreds of thousands of these 50-cent bottles of Psychine.

And we do that to show our entire confidence in this wonderful preparation.

A confidence that has been based on our 30 years' experience with this splendid preparation, with a full knowledge of the hundreds of thousands of cures it has made.

COUPON No. 77

To the Dr. T. A. SLOCUM, Ltd.
193-195 Spadina Ave., Toronto

I accept your offer to try a 50c. bottle of Psychine (pronounced Si-keen) at your expense. I have not had a 50c. bottle of Psychine under this plan. Kindly advise my druggist to deliver this bottle to me.

My Name.....

Town.....

Street and Number.....

My Druggist's Name.....

Street and Number.....

This coupon is not good for a 50c. bottle of Psychine if presented to the druggist—it must be sent us—we will then buy the 50c. bottle of Psychine from your druggist and direct him to deliver it to you. This offer may be withdrawn at any time without notice. Send coupon to-day.

To settle all doubt about which out throw harrow has the greatest capacity and lightest draft we ask you to test the "Bissell" Out Throw harrow in a field competition with other out throw harrows. We know the "Bissell" will outclass the field, because it is so designed that the hitch is well back, the seat projects over the frame, and the arch is directly over the gangs. This construction removes all neck weight—enables horses to do more work. And beeause one gang is set slightly aheatl of the other, the gangs cannot crowd or bump together. The "Bissel"' Out Throw works fast and does clean work. Like the famous "Bissell" In Throw, it always wins in field trials. We also make Out Throws and In Throws with two levers for hilly work, and in 16 plate wide cut styles for the West. Send to Dept. M. for "Bissell" Harrow Booklet. Remember, it isn't a genuine "Bissell" unless the "Bissell" name is stamped on the harrow.

Test The "Bissell" in a field competition with other Out Throws.

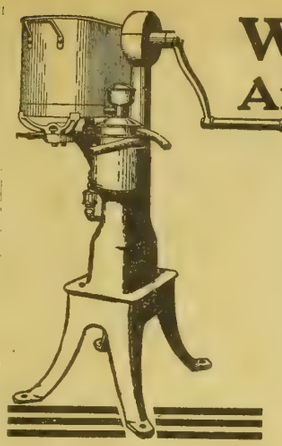
Meshed and Darned Bed Spread and Pillow ShamsMSpecial Prize—Made by Miss Maloney. Highly commended for design, work and general excellence.



Why I H C Cream Harvesters Are The Choice of Careful Farmers

Careful farmers judge the cost of a machine by its value. They know that a cheap price means nothing if quality is lacking. And they know that it is genuine economy to pay a little more for a machine that is worth double.

A high standard of values has been set by I H C Cream Harvesters. No one without I H C facilities can ever reach that standard. Today an I H C Cream Harvester simply means the utmost for your money—the biggest value you can get at any price.

If you investigate all cream separators you will appreciate I H C features and advantages all the more. Comparison proves I H C superiority in materials, construction, and efficiency. For instance, you will find that I H C Cream Harvesters are the only separators with gears which are dust and milk proof and at the same time easily accessible; I H C Cream Harvesters are protected against wear at all points by phosphor bronze bushings; I H C Cream Harvesters are constructed with larger spindles, shafts, and bearings than any other separator, insuring greater efficiency and durability; the I H C bowl is free from slots or minute crevices—that is why it is so remarkably easy to clean.

You will find an I H C in a style and size to meet your needs. Dairymaid is chain drive—Bluebell is gear drive. Each is made in four sizes, from 350 to 850 pounds capacity. The I H C local dealer will be glad to explain the above I H C Cream Harvester advantages and many others, all of which have much to do with your dairy profits. Ask him for catalogues and all information, or, write nearest branch house for the information desired.

I H C Service Bureau

The purpose of this Bureau is to furnish farmers with information on better farming. If you have any worthy question concerning soils, crops, pests, fertilizer, stock, etc., write to the I H C Service Bureau, and learn what our experts and others have found out concerning those subjects.

CANADIAN BRANCHES—International Harvester Company of America at Brandon, Calgary, Edmonton, Hamilton, London, Montreal, Ottawa, Regina, Saskatoon, St. John, Winnipeg, Yorkton.

Sold Wholesale by Manufacturers or National Drug & Chemical Co. of Canada

Our Island Letter.

Editor Maritime Farmer:—

The harvesting of the turnip crop now completed, finishes one of the very best all round crops, that our province has ever grown.

Potatoes was the only crop not quite up to the average, while grain, hay, corn and raots were all well above the average. Prices for all classes of live stock being good our farmers should have a most prosperous season.

With the taking over of the pork packing plant at Charlottetown by an experienced firm of packers, we had hoped that here the annual, violent slump in prices in November would be at least partly remedied. Instead, we have pork dropped from ten cents to seven and one-half cents and while buyers have some excuse to lower the price in face of an over supply with limited facilities for handling we can't see why a plant, such as we have in operation, could not dispose af the supply offered and pay a fair price in proportion to the markets in Montreal, which have not been below ten cents this fall for dressed hogs. It is to be regretted that we cannot have a firm here with enough business insight to see that this is working to the injury of the buyers and province at large. Farmers are well aware that an advantage is being taken of their inability to ship abroad at this season, as the same slump took place last fall, but prices went up at once when the weather got cold enough to ship abroad, without any appreciable advance in Montreal.

Very few hogs are offering at present with the price below eight cents.

We hope to again see the time when live hogs will again be taken, the year round, but it seems almost impossible to come to a satisfactory basis for buying them on foot.

Hog raising should go hand in hand with dairying, as skim milk intelligently fed does much to cheapen their ration. Frequently such a large quantity of milk is fed to the young hogs as to practically waste half its value. On many farms where the majority of cows come in in the spring, when the litter is young and small, they are often fed all they can consume while they get little or no milk when they reach the weight they can use it to the greatest advantage. While hogs are classed as the poor man's stock, and it is a fact that their profitable breeding, raising and feeding, is, probably, the least complicated and requires less skill than any other branch of live stock husbandry yet we meet some startling cases of ignorant negligence and carelessness such as are keeping a hog for a whole year to reach a weight easily obtainable in six months, Unless hog quarters can be kept dry and clean there is little profit in feeding winter hogs. Prices for dairy stock or horned cattle of any sort, was never as renumerative and farmers who are breeding stock of good quality find it pays them to continue the skim milk to growing calves well up to a year old. Calves that reach a weight of 800 to 1000 lbs. at a year old pay for a lot of good feed and this is the age at which it pays to push them. We would not think it a calamity if we did not raise hogs at all.

At this season many cargoes of hay, oats and potatoes are being loaded at our shipping points for export to Nova Scotia, taking with them their quota of Island soil fertility. It is regretable to see so much cheap hay being exported—$8.00 per ton here, with a cost of $1.00 for pressing, leaves the owner little for his labor and lost fertility Many farmers now realize this and are endeavoring to change over to some line of stock feeding, but where circumstances are such that it is necessary that the crop be sold at once to meet pressing liabilities, it is often a slow struggle to make the desired change. Too many still cling to the mistaken idea that it is impossible to realize as much by feeding as shipping in the raw state, else why would men who are continually lamenting their need of manure who rise early and scour the shores for seaweed, and laborously dig all sorts of mud deposits through frozen ice and snow for fertilizer, part without a regret, with what is the most valuable manure they can hope to secure. They must surely disbelieve the fact that they can secure it for the feeding of their crops and if intelligently fed and disposed of realize a much better price for their raw material. This is the greatest hindrance to better farming here. The failure to convince our farmers that there is as much money in feeding as in selling produce.

A very great deal has yet to be learned in intelligently handling and breeding live stock. Too few, as yet, know anything about balancing different rations to get the greatest feeding value out of farm crops. Nothing like the quantity of roots are grown, that should be grown on every farm.

Few indeed, very few, of the men who imagine themselves experienced feeders, feed enough to receive the greatest possible profit, and the vast majority feed only enough to produce at a loss. These are facts of which every observing man is aware and in seasons of plenty, such as we now enjoy it is regrettable that more generous feeding is not being practiced.

Large quantities of commercial fertilizer and a large amount of lime is annually purchased by farmers, who, again sell oats at less than 40 cents per bushel, to pay for it, convinced that they cannot get that price out of any sort of stock feeding. Now, I often wonder, if these men don't realize that it would be better to feed until they lost the price of their lime and fertilizer, if lose they must, rather than buy what is certainly not as valuable as farm yard manure.

Quite a quantity of cream is now being exported to the U. S., and our farmers realize what it would mean to them with better trade relations if other products were admitted as well. However, important trade relatians with foreign markets are, and we do not deny the importance of the agitation now being made for a lower tariff, yet this is insignificent in comparisan with the conservation of soil fertility. The most important problem for us at present, is, how can we increase the annual earnings of each individual acre of our Island soil; how can we grow and develop; how can we carry more people on the land and incidentally earn a living for a greater population in our towns? These are problems we are now facing, and as far as I can see, the only way is to adopt a line of live stock raising that will greatly add to the fertility of the soil, till we build one farm upon another.

Many such farms are now yielding double the revenue they yielded a few years ago. But many more are either barely holding a low average production or slowly growing poorer which is a great pity if it is not a crime, as it robs the Province of its rightful value this land should be earning. The influence that every man exerts is either helpful or hurtful. No man has any right to impovish any farm, occupied by him, in his generation by mining out the fertility and then pull up his stakes and leave a desert upon which some poor unfortunate will later try ito subsist. If the man who makes two blades grass grow where one used to grow is a benefactor to his race what then is the man who causes erly flourished? none at all to grow where two form-

Perpetual Youth.

Let Me Tell You How to Regain All Your Old Vim, Vigor and Manly Strength. Be a "Health Belt Man;" Feel Young for Balance of Your Life. Age Doesn't Count if You Have the Vitality.

"I could shout for joy. After years of Weakness and Debility your Wonderful Health Belt cured me. I am a man again. Use my name as you see fit."

Leon Turpinat,

Stellarton, N. S.

Perpetual youth. That is precisely what I mean. I say as man to man give my Health Belt a reasonable chance and it will carry you through any business, mental or physical strain you may be under. It doesn't stimulate; it simply adds the electro-tonic element to your bone, nerves, tissue and blood; all the force and strength which has been drained from your system by some earlier indiscretion. My Health Belt is essentially a strength giver. It overcomes the private symptoms of weakness in men which sap the vitality. If you are nervous and lack manly vigor, you are passing away thousands of brain cells every day. Ask your physician if this is not true. I stop this awful weakening process. You wear my Health Belt nights; while sleeping a great stream of soft electricity passes into your body at the small of the back; it cures backache in one application; you feel better immediately; inside of an hour; two months will make a new man of you. No drugs; no privations; no restrictions except that you must give up all dissipation. Follow my advice and I promise you will feel younger and look younger. Let me restore your vitality, and you will be able to face the world with new ambitions. The Health Belt cures other ailments too. A positive remedy for rheumatism in any part of the body, sciatia, lumbago, kidney, liver, stomach disorders.

Special attachments furnished, and worn by women as well as men.

FREE UNTIL CURED.

Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.

Let Me Send You These Two Books FREE.

They fully describe my Health Belt and contain much valuable information. One is called "Health in Nature" and deals with various ailments common to both men and women. The other, "Strength, the Glory of Man," is a private treatise for men only. Both sent upon application, free, sealed, by mail.

If in or near this City, take the time to drop in at my office that you may see, examine and try the Belt. No charge for professional advice either at my office or by mail. If you cannot call, fill in the coupon and get the free booklets by return mail. They are better than a fortune for any one needing new vigor

Holstein cow, 3 yrs. old—1, Samuel Dickie; 2 and 3, Logan Bros., Amherst Point.

Holstein heifer, 2 yrs. old—1 and 2, Samuel Dickie; 3, Logan Bros.

CLASS 12.—GUERNSEYS.

Guernsey cow, 4 yrs. and upwards—1, 2, 3 and 4, Roper Bros., Charlottetown.

Guernsey cow, 3 yrs. old—1 and 2, Roper Bros.

Guernsey heifer, 2 yrs. old—1 and 2, Roper Bros.

CLASS 13.—JERSEYS.

Jersey cow, 4 yrs. and upwards—1, 2 and 3, H. S. Pipes & Sons, Amherst.

Jersey cow, 3 yrs. old—1, Jas E. Baker & Sons; 2, J. R. Semple, Brule, N. S.

Jersey heifer, 2 yrs. old—1 and 2, H. S. Pipes & Sons; 2, Jas. E. Baker & Sons; 4, J. R. Semple.

CLASS 14.—GRADES.

Grade cow, 4 yrs. old and upwards—1 and 3, T. W. Keillor, West Amherst; 2, Fowler Bros; 4, Fred S. Black; 5, W. N. Boomer, West Amherst.

Grade cow, 3 yrs. old—1, J. R. Semple; 2, Geo. M. Holmes; 3, McIntyre Bros.

Grade heifer, 2 yrs old—1, J. R. Semple; 2, W. N. Boomer; 3, Geo. M. Holmes; 4, Fowler Bros.; 5, T. W. Keillor, West Amherst.

CLASS 18.

The Holstein-Friesian Association of Canada offer a Silver Cup to Champion Cow in Grade Class, providing she is sired by a Holstein-Friesian bill, whose name and number must be given at the time of entry.

Won by T. W. Keillor, West Amherst.

SHEEP.

CLASS 26.—LEICESTERS.

Ewe, 2 years and over—1, 2, 3, and 4, Albert Boswall, Pownal, P. E. I.

Ewe, 1 yr. and under 2—1 and 2, Albert Boswall; 3, Samuel Lane, Pownal; 4, Albert Boswall.

Ewe Lamb—1, 2 and 3, Albert Boswall; 4, Samuel C. Lane.

Yearling Wether—1, Albert Boswall; 2, 3 and 3, Samuel C. Lane.

Wether Lamb—1, Albert Boswall; 2, 3 and 4, Samuel C. Lane.

CLASS 26—LINCOLNS.

Ewe, 2 yrs. old and over—1, Albert Boswall, Jr., French Fort, P. E. I.; 2, Jas. A. Telfer, Sussex, N. B.; 3, Chas. Symes, Minudie, N. S.; 4, C. W. Pugsley.

Ewe, 1 yr. and under 2—1, 3 and 4, Jas. A. Telfer; 2, Albert Boswall.

Ewe Lamb—1 and 4, Albert Boswall, Jr.; 2 and 3, Jas. A. Telfer.

Wether Lamb—1, Albert Boswall Jr.

CLASS 27.—COTSWOLDS.

Ewe, 2 yrs. old and over—1 and 2, Jas A. Telfer; 3 and 4, H. B. Parlee, Sussex.

Ewe, 1 yr. and under 2—1 and 2, Jas. A. Telfer; 3 and 4, H. B. Parlee.

Ewe Lamb—1 and 2, Jas. A. Telfer; 3, H. B. Parlee; 4, John Tweedy, Earnscliffe, P. E. I.

Yearling Wether—1, H. B. Parlee.

Wether Lamb—1, John Tweedy.

CLASS 28.CHEVIOTS.

Ewe, 2 yrs. old and over—1, 2, 3 and 4, Chas. Symes, Minudie.

Ewe, 1 yr. old and over—1, 2, 3 and 4, Chas. Symes.

Ewe Lamb—1, 2, 3 and 4, Chas. Symes.

Yearling Wether—1, Jas. E. Baker & Sons; 2, 3, and 4, Chas. Symes.

Wether Lamb—1, 2, 3 and 4, Chas. Symes.

CLASS 29.—HORNED DORSETS.

Ewe, 2 yrs. old or over—1, Geo. L. Boswall; 2 and 3, Hartland Poultry Yards, Hartland, N. B.

Ewe, 1 yr. and under 2—1 and 3, Hartland Poultry Yards; 2, Geo. L. Boswall.

Ewe Lamb—1, 2 and 3, Geo. L. Boswall; 4, Hartland Poultry Yards.

CLASS 30.—SOUTHDOWNS.

Ewe, 2 years old and over— 1, Jas. A. Telfer; 2, 3 and 4, James E. Baker & Sons.

Ewe, one year old and under 2—1, 2, and 3, Jas. E. Baker & Sons; 4, Jas. A. Telfer.

Ewe Lamb—1 and 3, Jas. E. Baker & Sons; 2, J. E. Harrison, Maccan, N. S.; 4, Oliver C. Saunders, Trilley, P. E. I.

Yearling Wether—1 and 4, Jas. A. Telfer; 2, Jas. E. Baker & Sons; 3, Oliver C. Saunders.

Wether Lamb—1 and 2, Jas. A. Telfer; 3, Oliver C. Saunders; 4, J. E. Harrison.

CLASS 31.—SHROPSHIRES.

Ewe, 2 yrs. old and over—1, Jas. A. Telfer; 2, Logan Bros.; 3, Jas. J. Stewart, Amherst Point; 4, Geo. L. Boswall.

Ewe, 1 year and under 2—1, Jas. J. Stewart; 2, Jas. A. Telfer; 3, Geo. L. Boswall; 4, Logan Bros.

Ewe Lamb—1, Jas. A. Telfer; 2, Jas. J. Stewart; 3, Logan Bros.; 4, Geo. L. Boswall.

Yearling Wether—1 and 3, Logan Bros.; 2, Jas. J. Stewart.

Wether Lamb—1, 2, 3 and 4, Jas. J. Stewart.

CLASS 32.—OXFORDS.

Ewe, 2 years or yver—1, 3 and 4, Jas. E. Baker & Sons; 2, Jas. A. Telfer.

Ewe, 1 year and under 2—1, Jas. A. Telfer; 2 and 3, Jas. E. Baker & Sons; 4, Burder Goodwin.

Ewe Lamb—1, Jas E. Baker & Sons; 2 and 3, Burder Goodwin; 4, Jas A. Telfer.

Yearling Wether—1, Jas. E. Baker & Sons.

Wether Lamb—1, 2 and 3, Jas. E. Baker & Sons.

CLASS 33.—HAMPSHIRES.

Ewe, 2 years and over—1 and 2, Jas. A. Telfer; 3 and 4, Cephas Nunn, Winslow Road, P. E. I.

Ewe, one year and under 2.—1, Jas. A. Telfer; 2, 3 and 4, Cephas Nunn.

Ewe Lamb—1, Jas. A. Telfer; 2, 3 and 4, Cephas Nunn.

Yearling Wether—1, Chas. E. Norton, Moncton, N. B.

Wether Lamb—1, Jas. A. Telfer; 2, Cephas Nunn.

CLASS 34.—SUFFOLKS.

Ewe, 2 yrs. or over—1, 2 and 4, Albert Boswall, Jr.

Ewe, one y?ar and under 2—1 and 2, Albert Boswall, Jr.

Ewe Lamb—1, Albert Boswall.

Wether Lamb—1, Albert Boswall.

CLASS 35.—GRADES AND CROSSES.

Ewe, 2 years or over—1 and 3, Jas. J. Stewart; 2, Albert Boswall; 4, Jas. E. Baker & Sons; 5 and 6, Oliver C. Saunders.

Mulching Strawberries.

(Continued from page170.)

Do not delay mulching too late for alternate freezing and thawing loosens the plants, by breaking their roots, and as a result if not actually killed later on will be greatly weakened in vigor.

W. S. BLAIR.

St. Anne deBellevue, Que.

The Tenth Maritime Winter Fair

(Continued from page 171.)

this important branch to do still better next year.

The Amherst Winter Poultry Show has out grown a one judge affair. A. C. Smith, of Waltham, Mass., worked hard to place the awards in the open classes but could not get through and Seth Jones, of Sussex, was put on to place the awards in many of the varieties.

The only complaints heard from exhibitors was the delay in getting the awards placed early in the show. No doubt the management will remedy this next year by putting two or three judges on the job. No one man can successfully do it now and do justice to himself or the birds.

Mr. F. C. Elford, of McDonald College, judged the utility classes of poultry, ducks, geese and turkeys and dressed poultry with usual acceptance. J. P. Landry of the Truro Agricultural College, superintended the poultry show again and gave complete satisfaction.

HONEY.

The honey and wax exhibit showed an improvement over that of last year. The principal exhibitors were: W. G. Asbell, Sussex, N. B.; B. W. Baker and Craig Bros., Amherst, N. S.; W. B. Wallace, Newport Landing, N. S., and Julia A. Corbitt, Amherst Point.

SEEDS.

Never before, in the history of the Seed Department, of the Maritime Winter Fair, was there so large entry—an entry that taxed the capacity of all the available space to the utmost. Never before was such a high class quality of grain and judges to split hairs again and potatoes in evidence compelling the again. Many, in fact, nearly all of the rejected samples would have easily won first place five years ago. And last, and perhaps best of all,, never before was there such a demand for seed, regardless of price, as long as it was good.

The Canadian Seed Growers' Association put up a still larger and better show than it did last year, and the competition was still keener and closer The principal exhibitors here were:

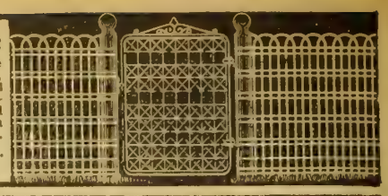
Mr. Robert MacKay, Millsville, Pictou Co., N. S.; with Red Fife Wheat of the 4th year's selection. Manitoba White Oats 2 years selected. Mensury Barley, 3 years selected. Canada Beauty Peas 6 years selected and Beauty of Hebron Potatoes selected for 3 years.

T. J. Wiggington, Bridgetown, P. E. I., had White Russian Wheat. Banner Oats and Mensurg Barley of the 11th, 3rd and 2nd years' selection respectively.

Richard Creed, AlbiooA, P. E. I., exhibited groups of White Russian Wheat and Banner Oats each selected 4 years. Mensurg Barley and White Marrowfat Peas, selected 3 years. A sheaf of Regenerated Abundance Oats, also Early Harvest Potatoes 4 years selected and a nicely matured sample of Indian Corn.

Donald Innis, Tobique River, N. B., the winner of the Steele, BriRggs trophy last year did not come out as strong as usual cantent to rest on his laurels. He showed White Fife Wheat and Early Blossom Oats of the 01th r?ar selection.Also White Marrowfat Peas 5 years selected.

Peerless Lawn Fence



Is Strong and Attractive. All the wires are uniformly crimped, large gauge, steel spring wire, heavily galvanized and coated with white enamel paint. Never sags, never rusts. Improve your property with a Peerless Fence. Cheap as wood and more handsome and durable. Also full line of farm and poultry fence and gates. Write for information.

ILLSLEY & HARVEY CO., Ltd., - Port Williams, N. S.

Wm. E. Palmer, Scotch Lake, N. B., White Russian Wheat and Bannet Oats of the 5th and 10th years selection.

Thomas Waugh, North Bedeque, P. E. I., produced White Russian Wheat and Banner Oats selected for 11 and 8 years respectively.

E. E. Arsenault, Urbinville, P. E. I., came out with group exhibit of Old Island Black Oats and White Russian Wheat, of the 3rd and 5th years selection. Also a sheaf of Banner Oats.

H. R. Brown, Wallace Bay, N. S., showed a group of Banner Oats 8 years selected and sheaves of Regenerated Abundance Oats and Mandscheuri Barley as well as Green Mountain Potatoes, 5 years selected.

R. D. MacKay, Balmoral Mills, took first with his Red Fife. No one after seeing Mr. McKay's exhibit would ever dare to say that wheat of as good quality can not be produced in the Maritime Provinces as much further West. This strain of wheat has been grown in Nova Scotia for a large number of years, and speaks volumes for the benefits to be derived from selection and acclimatization.

Ira L. Rodd, North Milton, P. E. I., had Black Norway Oats 5 years selected.

Harry Eadie, Antigonish, N. S., showed Red Fife of the 5th year.

D. C. McNeil, Brophey's, Antigonish Co., N. S., showed a handsome sample of Dreer's Standard 2 years selected.

Among the new beginners were W. H. MacGregor, Lot 16, P. E. I., with Banner Oats. S. Harrison, of Maccan with Green Mountain, British Columbia White and Dakota Red Potatoes.

R. D. MacKay, Millsville, took the Steele Briggs cup but was closely pressed by T. J. Wiggington and RichardCreed. Another year is coming gentlemen. Who will take it in 1911.

Prominent among the exhibitors in the general class were, R. C. MacLean, Lot 16, P. E. I.; Henry Gordon, Chatham, N. B.; Harvey Parlee, Sussex, N. B.; Isaac Dourghart, Long River, P. E. I., who has led his province three years in succession in the Standing Fields of Grain Competition with scores not far from the possible mark on WaverleyOats. and a host of others all with splendid stuff.

Mr. MacLean won the cup donated by Mr. Ewing of Montreal. The boys are after the cup Mac. Come again in 1911. Now is the time to prepare for next year's success, and from the inquiries for seed we confidently look forward to an even better showing in 1911 than was made this year.

THE CLUB MEETINGS

Some interesting meetings were held in the board room where various agricultural clubs plan to hold their annual meetings each year. Reports of these meetings will be given in future issues.

Lack of space permits af a lengthy reference to the eloquent addresses given on Monday evening by Hon. J. D. Hazen, Premier of the Province of New Brunswick; Hon. A. K. McLean Attorney General of Nova Scotia; Hon. Jno. Matheson, Leader of the Prince Edward Island opposition party and Hon. D. V. Landry Commissioner of Agriculture for New Brunswick, each of which rang with optimism re the future prospects of Maritime Canada.

ON TUESDAY EVENING.

Hon. J. J. Richards, Commissioner of Agriculture for Prince Edward Island, occupied the chair and highly instructive addresses were given by Mr. Dan Drummond, Ottawa, on the question of "Dairying", Prof. M. Cumming on the "Conservation of our Agricultural Resources"; Senator W. Ross on "Advice to Young Men", and Mr. W. R. Elliott on "Beef Production."

ON WEDNESDAY EVENING

B. M. Fawcett occupied the chair and Messrs. S. J. Moore, C. M. McRae and Dr. W. W. Andrews and Prof. J. H. Grisdale gave heart to heart talks respectively on "The Importance of Good Seed"; "Swine"; "Drainage" and "The Sheep Industry." These addresses brought out considerable of valuable discussions.

ON THURSDAY EVENING.

Col. H. Montgomery-Campbell presided and introduced Mr. E. B. Elderkin, who gave an interesting address on "Trade Relations with the West Indies," in which he showed that there is an extensive market in the West, India Islands for Maritime live stock and that it is to the interest of our breeders to cater, as much as possible to that trade.

The presentation of Special Prizes by H. J. Logan followed by the singing of the National Anthem brought the biggest and best Winter Fair to a close and each and every one left for their homes feeling that the time they had spent there was not spent in vain.

A Prince Edward Island Boy
Gathering up the Odds and Ends.

FLOR CULTURE.

Ferno, St. John, N. B., writes:—I have a large Sword Fern, which is a handsome plant and is in a seven inch pot. It was repotted last spring. Lately the new leaves are not developing well and some are turning brown at the tips. What had I better do for it?

Your fern wants repotting. Probably it is a little early to do so but, if you find difficulty in keeping it moist and the tips go back you better repot it into a pot about nine inches in diameter using good rich soil and not disturbing the roots any more than you can help. Have plenty of broken crocks in the bottom of the pot for drainage. Cut off all diseased leaves and those little hard runners that make out from the side of the plant. Spray the foliage frequently and give only moderate heat. Be sure that drainage is always perfect and that no water be allowed to accumulate in jardinere.

Mary S., St. John, writes:—Would you please inform me how to increase my number of Sultana plants. I have two large bushy ones and I did not know whether slips would grow or not.

The Sultana is easily grown from cuttings or slips, treated exactly as you do a Geranium. It is also easily grown from seed, which can be procured fram all seedmen.

Inquirer, St. John, writes:—I have a large Hyderangea, that I purchased last summer when in bloom. It has been in a dark cool part of the cellar all winter, without any water. I discovered yesterday that the green buds were bursting all over it. What should I do with it now?

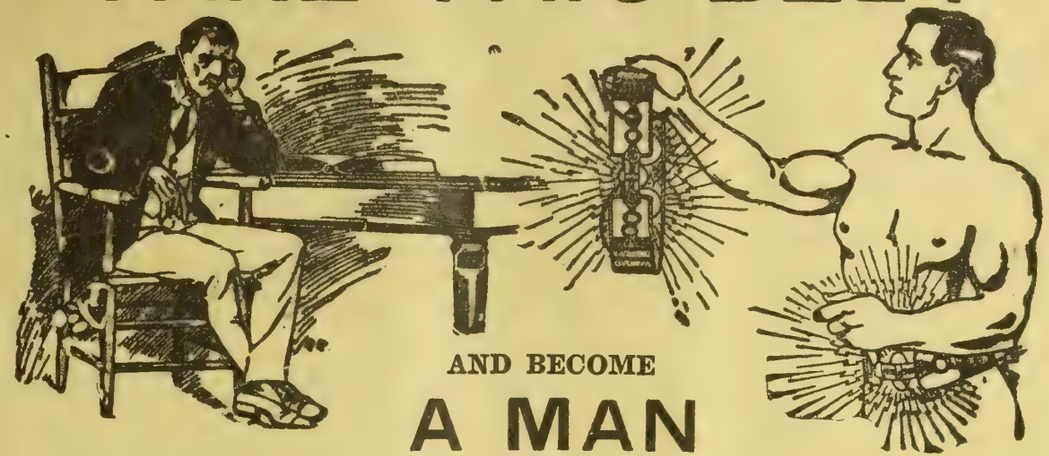
The Hyderangea should be turned out of this pot and after removing all the loose soil repot in fresh soil, water it well and bring it up to the light. Give only moderate heat at first and no sunshine for at least two weeks when it should have all the sun possible and plenty of water. An occasional spraying of the stems will help it to develop it more.

Watch your Dutch Hyacinths in pots and give plenty of water until done blooming. Liquid cow manure will improve the flowers wonderfully.

Save all bulbs of Yellow Narcissus and plant in the garden, for future blooming in the spring.

Spray and wash Palms, Rubber Plants and Ferns at least twice a week, during the cold weather when there is much dry, artifical heat. This is very essential as such plants are nearly dormant, so much so that they do not require so much water, but of course do not want to be allowed to dry out.

TAKE THIS BELT



AND BECOME

A MAN

All men cannot be MILLIONAIRES, but thousands of them could be much better off FINANCIALLY, SOCIALLY and in every other respect if they would guard their health. With VIGOROUS HEALTH—a body full of ELECTRICAL ENERGY—a man can make OPPORTUNITIES if he don't find them, but lacking in the COURAGE and SELF-ASSURANCE that is born of MANLY VIGOR, he is but a derelict—a vessel without mast or rudder—cast hither and thither by every storm of life that besets his pathway. GIVE ME A MAN that has exhausted his VITALITY—suffering from PAINS AND ACHES—MENTAL DEPRESSION—SLEEPLESSNESS—NERVOUS DEBILITY—without HOPE—AMBITION — COURAGE gone — drifting with the tide—and I can transform him into a STRONG MAN—A man of push—a man that will make his way in spite of all obstacles—if he has anything left to build upon, and he will follow my advice and use the DR. McLAUGHLIN ELECTRIC BELT as I direct. Save your tobacco money for a few weeks—cut out a few of your health-destroying, soul-destroying habits—procure one of these appliances—USE ELECTRICITY, and use it in the right way to invigorate your body, and you will look upon the day you gave your case to me as the TURNING POINT OF YOUR LIFE. Here is what some say of this remedy, who have used it:

Dear Sir,—I am perfectly satisfied with your Belt for what it has done for me. I am now a well man.

Yours, very truly,
HUGH McLEAN.
New Glasgow, N.S., Box 464.

Dear Sir,—I find your Belt all right for every kind of pain that is felt in the human body, and I have not missed a day with sickness since I got the Belt.

Yours very truly,
JAS. W. BARRIE.
Auld's Cove, N.S.

Dear Sir:—

Having received a Belt from you some years ago, I now desire to express myself in regard to the benefits, which I received from it. I wish to say in as few words as possible that it was all that it was represented to be, having cured me of Indigestion and other ailments, and I must say that I feel a new man, and I give all credit to Dr. McLaughlin's Electric Belt. I would advise any one suffering to give the Belt a trial, and I know they will feel as I do. Although I have been four years benefited without saying so to you, I have been doing all I could in my locality personally. So giving you the privilege of using this letter as you wish, and wishing your Belt every success, I remain,

Sincerely yours,
SAM J. HARNETT.
North Gower, Ont.

Any man or woman who will give me reasonable security, I will send them the Belt, with all the necessary attachments suitable for their case, and they can

PAY WHEN CURED

Never mind waiting until you use the last dose of that bottle from the drug store. Begin now. Call and talk your case over with me or send for my book. It costs you nothing. For over 24 years I have taught the great truth that "ELECTRICITY IS LIFE," and have proved the soundness of my doctrine by making cures when others have failed time and again. Others have aspired to do the work I am doing with my ELECTRIC BELT. They offer you Electricity in some other form, or an "electric belt" that possesses no curative power whatever. They are like "boys on bladders" floundering in a sea of uncertainty—while to-day the DR. McLAUGHLIN ELECTRIC BELT stands the world over as the most correct—the most perfect—method of applying Galvanic Electricity to the body that has ever been devised. Call at once or send coupon for our FREE illustrated 80-page book, from which you can learn much that you want to know. Do it now.

M. K McLAUGHLIN

214 St. James St., Montreal, Can.

Dear Sir,—Please forward me one of your books as advertised.

Name .....

Address .....

Office Hours—9 a.m. to 6 p.m.; Wednesday and Saturday till 8.30 p.m.

The Social Tramp.

There is no woman, perhaps, who is a greater menace to society as a whole, or more of a nuisance and drain on busy women, than the idle woman with no family or home of take up her time and attention. It is a delicate matter, in the minds of many women who value their time and energies, to deal with this type of woman. At the same time no woman who has work to do can afford to bother with this type of the social tramp who runs in upon her at any and all hours and literally steals away the precious hours that belong to home life and home duties, and whose only topic of conversation is either idle gossip, or complaints of troubles which arise only and solely out of sheer idleness.

A LOVELY WATCH FREE

A Solid Gold Watch for ladies or gentlemen, costs $25 to $50. **Don't waste your money.** If you wish a watch to keep time equal to any **solid gold watch,** with genuine American lever movement full jewels, send us your name and address immediately and agree to sell 12 boxes only, at 25c. each, of our famous **Canadian Pink Tablets,** which are an excellent remedy for the blood, nerves and tissues of the entire system, thereby curing nervous debility or prostration, anemia, brain fag, nervous headache, female weakness, dyspepsia, indigestion, sleeplessness, mental depression, rheumatism, sciatica, neuralgia, female complaint, and all diseases arising from excesses, overwork, worry, and deficient nutrition. (Continued next issue.)

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Drill Hall, St. John, N. B.," will be received at this office until 4 00 P M., on Monday, January 9 1911 for the construction of a Drill Hall at St. John, N. B.

Plans, specification and form of contract can be seen and forms of tender obtained at this Department and on application to Mr. D H. Waterbury, Supt., of Public Buildings, St. John, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation, and place of residence of each member of the firm must be given

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, equal to ten per cent (10 p.c.) of the amount of the tender, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned

The Department does not bind itself to accept the lowest or any tender.

By order.

R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, Dec. 14. 1910.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

A. H. Thompson, Fredericton, N. B.

Sunny Brae Sheep Ranch.

Jas. A. Telfer, Prop., Sussex, N. B.

Breeder and importer of high-class Hampshire, Shropshire, Oxford, South down, Lincoln, Cotswold and Leicester Sheep. Sheep of both sexes, all breeds for sale at reasonable prices. Correspondence solicited.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad, as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

AGENTS WANTED, apply THE ELECTRIC BEAN CHEMICAL COMPANY, Ottawa, Ont.

SHORTHORN BULLS FOR SALE.—WALTER EATON, Upper Canard, Kings Co., N S.

SEND POST CARD TO "PECK'S NURSERY, Wolfville, N. S.," and get printed price list of fruit trees, &c.

LABELS

Metal Ear Labels for Cattle, Sheep and Hogs.

The old standby for all who have stock liable to stray, or to dispute as to identification or ownership; for herd or flock records, or for general convenience. Send for free circular and sample. It may save you much trouble. Write to-day.

F. G. JAMES, BOWMANVILLE, ONTARIO.

Catarrh.

Subscriber, N. S.:—Four years ago I started in with a small flock of sheep. I now have fifteen ewes, the oldest of which is six years old. About a year ago, a few of them began discharging from the nose. In the spring they began coughing and they have coughed by times all summer. Now as cold weather comes they seem to be getting worse. The cough has a hoarse hollow sound. Some times they cough very badly. In other ways the sheep seem to be all right. They eat well and look well and raised nice lambs The trouble seems to be spreading in the flock. Would you kindly give me some advice through the columns of your paper?

The sheep are suffering from catarrh. They should be, when housed, in a well ventilated, lighted roomy, clean not over warm building and given daily exercise, except on extremely wet days. They should have access to [illegible] water at all times. Feed sufficient nutritive food, such as early cut, well cured hay, small quantities of oats and wheat bran along with some pulped roots, turnips or mangels daily and salt at all times.

Have their heads steamed daily with medicated steam, using one teaspoonful of Tincture of Iodine to a gallon of boiling water, for 7 or 8 sheep, and the same quantity of carbolic acid and spirits of camphor used in the same way on alternate day as follows: The first day, Iodine, Second day, carbolic acid and Third day spirits of camphor and repeat often as necessary.

To use, put boiling water in a pail and pour in the medicine and hold the sheep's nose over the pail for a minute, then take another sheep and when the steam ceases to rise freely stir the water and the steam will rise more freely for a time. When steam ceases to rise more boiling water should be procured until all the diseased sheep have been treated.

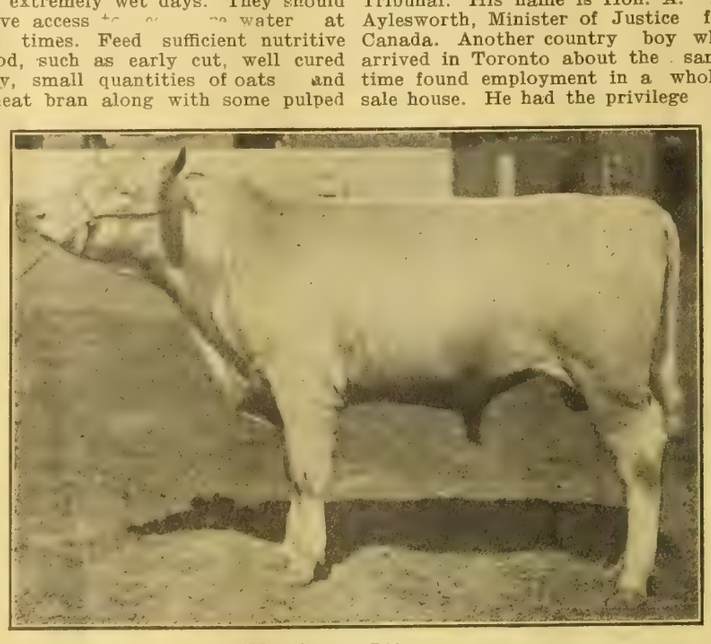
Do not place anything over the sheep's head and steam vessel to allow only steam to be inhaled but permit pure air to accompany it. Smearing around the nostrils with pine tar is beneficial. The cause has probably been poorly ventilated, or too small a stable, which may have been sufficient for a small number in the beginning but is inadaquate for the greater number. Sheep require plenty of room, lofty ceilings, well ventilated stabling free from drafts and not too warm.

J. STANDISH, V. S.

The PUBLISHER'S DESK.

We have just received the announcement of the death of Mr. Wm. Smith the inventor of the Stump Puller, which appears on another page of this issue. Mr. Smith, who died on November 21st, was the founder and president of the Smith Grubber Co., LaCrescent, Minn. He was born on April 10th, 1833, and invented the Stump Puller in 1861.

WHAT TWO COUNTRY BOYS HAVE DONE.—In 1870 an awkward, overgrown boy from the country appeared at Toronto University to attend lectures. His fellow students, noticing his uncouth appearance and the marks of the farm which still clung to him, promptly christened him "cowheels." This country boy recently succeeded in winning the Newfoundland Fisheries Dispute from the United States before The Hague Tribunal. His name is Hon. A. B. Aylesworth, Minister of Justice for Canada. Another country boy who arrived in Toronto about the same time found employment in a wholesale house. He had the privilege of walking a mile and a half each morning, working for twelve hours and then walking the same distance back at night—all for the munificent salary of two dollars a week. This boy's salary did not remain at two dollars very long, for his employers soon discovered the stuff of which he was made and rapidly advanced him. In course of time he became head of one of the largest stores in Canada. Then began under his direction the development of a mail order business which eventually covered the Dominion from the Atlantic to the Pacific, from the Great Lakes to Hudson's Bay. This country boy was H. H. Fudger, now president of the Robert Simpson Company. During the past year one of Mr. Fudger's dearest ambitions has been realized—that of serving every resident of the Dominion on exactly equal terms. His house was the first to inaugurate the policy of shipping goods free of delivery charges to any destination in Canada. This enterprise of r. Fudger's is a veritable boom to any Canadian living outside the large cities; it enables him to make his purchases at city prices and receive the goods delivered free, no matter where he lives. The new system has just been put in operation and is well worth a trial. Any of our readers can get a free copy of the Simpson Mail Order catalogue by writing for it.



Chatham Clipper,

Reserve Junior Champion Shorthorn Bull at the 1910 Dominion Exhibition, St. John, N. B. Owned by R. A. Snowball, Chatham, N. B.

A HANDSOWE CALANDER.—The first 1911 calendar to reach us this season is that of the St. John Business College and Shorthand Institute. The scene title is "The New Moon," from a painting by the self-taught artist, Edwin Lamasure. It carries with it a touch of humanity—the life of a man near to nature's heart. It is the tranquil hour when the day's work is over, and after the few evening chores are done will come the grateful relaxation of the sweet evening. We congratulate Messrs. S. Kerr & Son, Proprietors of the St. John Business College on their good taste in selecting such a handsome calendar for their trade.

Grand Trunk Railway System

CHRISTMAS and NEW YEARS HOLIDAYS.—Round trip tickets will be issued between all points in Canada, also Massena Springs, N. Y., Rouses Pt., N. Y., Island Pond, Vt., and intermediate stations at

SINGLE FIRST CLASS FARE

Going Dec. 24, 25 and 26, 1910. Return limit Dec. 27, 1910.

Also going Dec. 31st, 1910, and Jan. 1 and 2, 1911. Return limit Jan. 3, 1911.

For tickets and full information apply to

A. E. Marquette, S. P. A., King Edward Hotel, Halifax, N. S., or to J. Quinlan, D. P. A., Montreal, Que.

We happened to put buttermilk temporarily in our Boston bean pot, which, through much using, has acquired a dark brown tint inside. To our surprise, when the buttermilk was gone, so was the discoloration, and our bean pot had regained its pristine whiteness. E. P.

Many persons find themselves affected with a persistent cough after an attack of influenza. As this cough can be promptly cured by the use of Chamberlain's Cough Remedy, it should not be allowed to run on until it becomes troublesome. Sold by all dealers.

MOLASSINE MEAL

Wonderfully increases the flow and quality of the milk, and makes Rich-flavored Butter and Cheese. Dairy experts know its value and feed it to their cows.

Bouctouche, N. B.

For Sale,

Two Jersey Bulls suitable for Agricultural Societies from heavy milking dams. For further particulars apply

ROBERT ROBINSON,
Meadow View Farm, Sussex.

Why Tudhope's Selected for Canada the "EVERITT"

We Needed a Car

In our 60 years of building horse vehicles, pressure from our customers demanded that the Tudhopes produce in Canada a horseless vehicle—a motor car—which would be in that field of transportation as superior as the various Tudhope horse-drawn vehicles are in theirs.

We wanted an ideal car at a low price—a car that would be handsome, comfortable, safe, efficient, simple and strong. This would answer the demands on us.

Same price as in U.S.

$1,450

Two Years' Guarantee

With Extra Tire and Special Equipment

Points? Cost? Worth?

After months of searching, testing, judging and comparing, we decided that the car for Canada was the "Everitt."

We had to get a car that would stand Canadian roads without breakdown, would have a high clearance for the roughest roads, would have a staunch simple motor that wouldn't break down twenty miles from anywhere, would be operated and fixed, easily by the owner himself. This car had to be comfortable under all conditions—light enough to be easy on tires. We found cars that nearly met these demands, but with selling prices high above fair intrinsic values. Slow methods of making and costly experiments made these high prices. We would avoid them for Canada. We would cut out the experiments and slow factory methods, and give a car the equal of cars usually sold at $2,500.

You Pay EXACTLY U.S. Prices

Canadians are not charged $250 to $400 over American prices in the "Everitt" car. The cost of the "Everitt" with extra tire and special Canadian equipment in the U.S. is $1,450. The Canadian special equipment costs extra there—is not furnished in the United States—is furnished in Canada. $100 extra is charged in the United States for the extra tire and special equipment that come with the Canadian "Everitt."

You pay the same price here as in the United States—no 'duty' to add—no extra cost.

A Powerful Motor

The "Everitt" motor has 152 less parts than our nearest competitors. One-piece main casting includes upper-half crank case and crank bearings, cylinders, combustion chambers, intake and exhaust manifolds.

Tremendous strength is possible through this simplicity. All strain comes between the crank-shaft bushings and cylinder heads on nickel-steel studs—3 simple parts, which cannot rack to pieces.

The weight saved means speedier and longer-wearing qualities in the car. It means the motor cannot get out of order easily.

It is an owner's motor.

How Simple The Motor Is

The motor is simple in other ways, too. The oiling, for instance, is automatic. All four connecting-rod bearings dip in the bottom half of the crank-shaft housing. This is like a dish, with oil in it.

The bearings dash into this oil each revolution. They oil themselves. The splash oils the pistons, and the pistons oil the cylinders. The splash also oils the crank-shaft bearings, the cam-shaft, the cams, the push-rods. You personally need have only one care—to fill the oil chamber.

Power At The Tires

The power transmission in the "Everitt" is "flexible." We mean by that that the motor, clutch, shaft and speed-gear box, leading to the rear-axle drive, have "give and take" in them.

If a rear wheel rises over a rock in the road, the axle tilts, the gear box and shaft rise slightly, the clutch accommodates itself—there isn't an ounce of strain on motor, shafting, tire and wheel.

To show how much power the "Everitt" can really get to the rear tires, we use only two universal joints, just behind the clutch. Universal joints consume power as they are out of line. In the "Everitt," unlike many shaft-drive machines, the transmission gears are placed at the rear axle, doing away with one universal joint. The clutch and its universal joints are at the far end of the propeller shaft, where the movement is least. Minimum universal joint movement is in this design. Little power is lost. It means speed, and little strain on motor, shaft or rear axle. It is almost the only way to build a car for the roughest roads in Canada.

Big Wheels, Wide Bodies, Low Hung Car

We wanted the "Everitt" to be far ahead of anything ever offered either in Canada or the United States. The "Everitt" has 34-inch wheels. You find such construction only in $3,000 models and higher.

Rear seats are extra wide, easily taking 3 passengers. This is a luxurious feature. All upholstering is hand-buffed leather—a feature not to be looked for in cars under $3,500.

Long wheel base and short-turning features make an easily handled car.

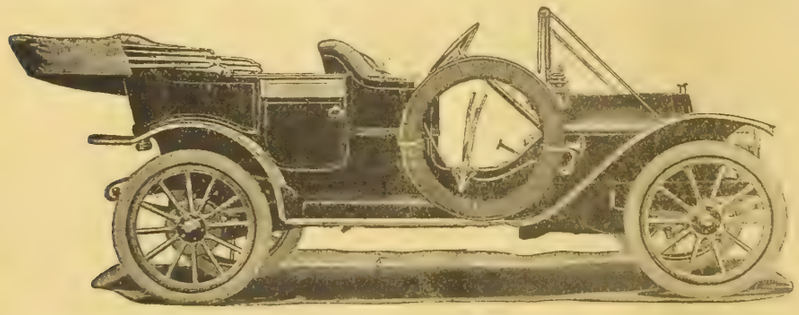
The double-drop "Everitt" frame permits a low centre of gravity, pulling the load close to the ground, preventing skidding, at the same time permitting 11¼ in. road clearance.

We Meet High-Price Standards

Jigs and fixtures both standardize and lower cost. "Everitt" cost savings allow us to use 3½% nickel steel. This gives you $4,000 car material in a $1,450-machine.

We meet high-price car standards in essential points.

Cars at as high as $3,000 offer no more than the "Everitt" $1,450.



"EVERITT" STANDARD TOURING 1911 MODEL, $1,450

Double-drop frame, 110 in. wheel base, 56-in gauge, 34 in. wheels, 3½ in. tires, universal rims, internal and external brakes on rear wheels, Bosch high-tension magneto, improved adjustable cone clutch, selective speeds, 3 forward, 1 reverse. Motor, 4 cylinder, 4 cycle, long stroke en bloc, 4 in. x 4¾, self-lubricating. Equipment magneto, horn, 5 gas and oil lamps, generator, *extra tire, tire cover, brackets, foot-rest, robe-rail, shock absorbers* and tool kit. (Mohair top, dust cover and windshield, **$125.00** extra.) F.o.b., Orillia.

Yet, though we gave $2,500 value, as understood in quality and perfection, we aimed to make the price $2,000 or less. The problem was first one of design, then one of manufacturing methods.

We Sought "High-Price" Standards

In our search we planned to make a car that in material, design and wearing quality would be a de luxe car. This meant using 3½% nickel steel in transmission gears, for instance, getting Bosch magnetos, large wheels, and other "high price" details. It had to be a long-stroke, large-capacity, four-cycle engine, simple and long-wearing. We wanted our car to be consistently good, through and through.

Jigs and Tools

These things added to car value immensely—made the car better. But they also added to cost. Could manufacturing cost—labor cost and material—be reduced, and how? We found they could be by using "jigs." "Jigs" are glass-hard metal fixtures. These hold each automobile part absolutely true while being made. They guide drills, planers, and other machines working up these parts to plane, drill, etc., exactly right. These parts must not vary 1-1000th of an inch, are always absolutely true. A jig is a rigid, exact guide that forces absolute accuracy of work, so no pieces are spoiled, no pieces are imperfect, no pieces vary, no labor-time is lost, no time is consumed in adjustment.

The first cost is great. The labor-saving is immense. The speed of production is tremendous, once work is started, after jigs are made.

We Find How To Give Canada Car Value

This was the new way to make automobiles. The old way was to make pieces roughly by working drawings, assemble these pieces, and fit them together by slow and laborious processes, and slowly turn out a few cars at a high cost per car.

The design of the car being correct, the car we would give Canada would be a "jig" car. We could turn out a hundred such cars at the labor cost of turning out a score of cars made the ordinary way, and fitted together. This reduced cost. It gave value. It gave room for value in materials—in the quality of metals used.

If we could get such a car, we could give Canada the greatest value known in car manufacturing. We could reduce the price. We could entirely make such a car in Canada, having its "jigs" already designed for us.

This is something new in Canada—making a car entirely from "jigs."

We Find The Car

Lack of "jigs" for making such a car as we wanted cut out many cars. Finally we found the "Everitt" a car of perfect design for Canadian roads, with 782 special jigs to build it by. Experiments on both car and jigs were avoided.

Our search was ended. We selected the "Everitt." It was right. It met Canadian needs, the Canadian market price, the substantiality and accommodation needed to give a "consistent" car. We took the car itself. We erected a special factory We built the 782 special fixtures, duplicates of the Detroit fixtures. The "Everitt" car has behind it all the advantages of fifteen years' automobile design, and of modern making, without the cost of experimental work. By doing this we make in Canada, entirely out of Canadian raw material, a car with $2,400 value and $3,000 quality in bearings, etc., at $1,450.

Equipment Complete

We equip the "Everitt" to be a complete car at $1,450.

You don't have to spend $100 to $200 extra after you get your machine.

A complete extra tire, with brackets and cover, is included.

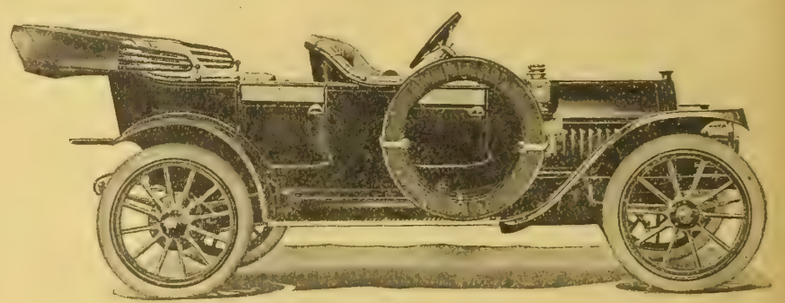
Set of 5 lamps and gas generator are included.

Shock absorbers on rear springs are regular equipment.

Robe-rail and foot-rest are regular equipment.

The "Everitt" is a complete car at $1,450 "as is." No other car approaches it.

This regular equipment is the most liberal and complete ever offered.



"EVERITT" FORE DOOR TOURING 1911 MODEL, $1,500

Double-drop frame, 110 in. wheel base, 56-in gauge, 34 in. wheels, 3½ in. tires, universal rims, internal and external brakes on rear wheels, Bosch high-tension magneto, improved adjustable cone clutch, selective speeds, 3 forward, 1 reverse. Motor, 4 cylinder, 4 cycle, long stroke en bloc, 4 in x 4¾, self-lubricating. Equipment magneto, horn, 6 gas and oil lamps, generator, *extra tire, tire cover, brackets, foot-rest, robe-rail, shock absorbers* and tool kit (Mohair top, dust cover and windshield; **$125.00** extra.) F.o.b., Orillia.

The "Everitt" — Two Years' Guarantee

5 Models

"Everitt" Chassis — the mechanical part of the car, engine and framework — is identical for the following models which we will make in Canada for 1911.

The **5-PASSENGER TOURING** model will be beautiful finish and design.

The **FORE-DOOR TOURING** Model with 5-passenger body, inside control.

The **DEMI-TONNEAU** Model, with detachable tonneau, transforms the car as desired to a two-passenger roadster.

The **TORPEDO ROADSTER** Model will have gasoline tank behind driver's seat.

The **LIGHT DELIVERY** Model conforms in general lines to the best standards.

Perfect Motor

Four-cylinder, 4-cycle, long-stroke motor has cylinders, valve chambers, valve seats, magneto and pump, and upper half of crank-case and seats for upper half of crank-shaft bearings, cam-shaft bearings and push-rod bearings in one piece

This prevents racking of motor and lost motion between parts Motor has long life.

CAMS are large, lessening wear by doubling area of frictional contact, and giving long life to cam-shaft and motor, with perfect valve action at all times

CRANK-SHAFT. Drop forging, 2¾ in. throw, 4¼ in stroke, 3 nickel babbit die-cast bearings.

CAM-SHAFT. Drop forging, 1¼ in diameter, cams forged integral.

VALVES. Operated by push-rods leading through upper half of crank-case to valve stem. All valves on left side of motor.

CARBURETOR. Special "Everitt" design, on right side of motor

SPLASH OILING. Lower half of crank-case is an oil container, and auxiliary oil reservoir, vacuum type, keeps oil at constant level

LOWER HALF OF CRANK-CASE is aluminum, and by removal gives access to all parts of motor individually.

PUMP. Centrifugal, gear-driven.

BOSCH MAGNETO. High-tension duplex model, driven by pump shaft.

BATTERY ignition in reserve.

TAKE DOWN SIMPLICITY. All parts of "Everitt" 4-cylinder engine accessible to owner for inspection or adjustment by removing lower-half of crank-shaft housing with 16 bolts Any piston, connecting rod, valve, etc., may be removed without disturbing any other part or disturbing timing. Replacements absolutely true to gauge, all parts being standardized.

CONE CLUTCH of aluminum with bulging facings of chrome-tanned leather to prevent clutch gripping suddenly.

STEERING. Worm and sector type, with knuckle protected by front axle; 17 in. wheel, with throttle and spark levers on sector below wheel.

FRAME. Double-drop type, giving low centre of gravity, 11¼ in. clearance. Best channel steel side members, 1¾ x 4 inch.

SPRINGS. 36 in. semi-elliptic at front, and 40 in. full scroll elliptic at rear.

FRONT AXLE I-beam drop forging with drop between springs.

REAR AXLE and **TRANSMISSION** incorporated in one unit

REAR AXLE SHAFTS encased in seamless steel tubing.

BRAKES. 2 sets on rear hubs—internal expanding and external contracting

CONTROL. Gear shifting lever and brake lever at driver's seat. Direct pull on all gear and brake rods beneath body of car. Service brake operated by push-pedal.

CAR LUBRICATION by dope and oiling devices, requiring little attention and easy of access.

Ultra Class Features

These are not found in cars that class with or near the $1,450 "Everitt" in price.

Large 34-in. wheels.
Large brake capacity.
Nickel-steel transmission gears.
All parts standardized to within 1-1000th inch.
Long-stroke motor.
Motor simplicity.
Wide rear seats

Two Years' Guarantee

The "Everitt" is made throughout from the best materials and entirely manufactured with "jigs," by which all parts are interchangeable and an absolute fit without machining or hand work.

On the "Everitt" car this extreme quality and perfection of design enables the makers to offer a guarantee of two years—12 times as long a guarantee as on ordinary cars

Comfort Devices

DEEP UPHOLSTERING on all seats, doors padded. Upholstering best hand-buffed leather, straps on seat

SHOCK ABSORBERS supplied on "Everitt" car as regular equipment

LOW HUNG BODY gives low centre of gravity, but double-drop frame gives high road clearance of 11¼ inches.

SPRING equipment, full scroll elliptic springs at rear.

DOUBLE-DROP FRAME allows "Everitt" to accommodate itself to road inequalities.

LONG-STROKE MOTOR reduces motor vibration, found in no other $1,450 cars.

LARGE WHEELS reduce road shocks by bridging ruts.

STEERING COLUMN set at comfortable angle—avoids shoulder strain. Large 17-in wheel.

DOORS open 90 degrees, giving easy access to car

INTERNAL BRAKE RODS leave running board clear, no tripping

GASOLINE GAUGE at footboard shows amount in tank without trouble.

Deliveries

The "Everitt" car, being made by means of 782 special "jigs," templets, fixtures, etc., as explained, not only has its individual parts made very rapidly, but many of the smaller parts are made on automatic machines.

This speed in making absolutely standard parts that are interchangeable from one "Everitt" car to another means easy and early commencement of "setting up."

Unlike cars made by old methods, building an "Everitt" car from its parts simply means joining by their proper bolts and other attachments pieces that are already true, and a perfect fit.

This means deliveries.

"Everitt" cars will be finished and ready on delivery dates promised

An Owner's Car

In considering a car purchase, remember that the "Everitt" is entirely Canadian-made. It is consistent, reliable, made of as few pieces as possible, especially the motor. You get with your "Everitt" a complete equipment

You can operate the car and do all the inspection it needs, all the adjusting, all the minor attentions it may need. You do not necessarily need either a chauffeur or a machinist. It is an owner's car in every sense.

The $1,450 you pay for your "Everitt" with its extra tire, and other regular equipment, means an absolutely complete purchase at the same price you would pay in the United States for the car and its Canadian equipment. Without this equipment you would be compelled to purchase a similar equipment, in purchasing any car.

This is explained in the catalogue.

Two Years' Guarantee

In place of a 60-day guarantee, the "Everitt" car is guaranteed for two years. This is possible because each part is inspected many times during the process of making, and each part that is finally put into stock, is a perfect part

This means to you ample time to bring out any flaws in the material of the car that may have escaped inspection. It means that the Tudhopes stand behind the car.

Want Quality

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the "**Ideal**" is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of seating directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinder head, so that when the valves become worn, the valve cage and valve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn, you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer.

"**Ideal**" **Gas and Gasoline Engines** are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price.

You Can Furnish Your Home FREE!

ANY housewife buying goods at the stores mentioned below may have their cash purchases apply on Asepto Soap Premiums. Every cent you spend counts toward a premium. A sure and mighty convenient way to save without increasing living expenses. Over 300 premiums of honest value to select from. The list will be increased every few weeks. Furniture will be offered next. The old way was to allow premiums to apply on Soap Wrappers only. Now at any of these stores—no matter what you buy—everything has its equivalent in Soap Wrappers. That is every five cents spent counts the same as one wrapper, while purchases of our goods as here advertised entitles you to two coupons—the one the merchant allows and the ones found in or on our goods themselves.

Dr. White's Honey Balm.—A cough syrup that is safe and sure. We are positive that no other cough syrup equals it. Price 25c. Equal to 5 soap wrappers.

Pendleton's Panacea.—The best hot medicine, in use nearly 100 years. Every person knows it is good. Price 25. Equal to 5 soap wrappers.

Brown's Cutilive.—A witch-azel cream for chapped hands, sunburn, etc. Price 25c. Equals 5 soap wrappers.

Scott's.—Salts, Senna, Sulphur, Saltpetre, Borax and Alum in 5c packages. Equal to 1 soap wrapper.

Brown's Spearmint Tooth Paste—Sweetens the breath, prevents decay, hardens the gums and whitens the teeth. Price 25c. Equals 5 soap wrappers.

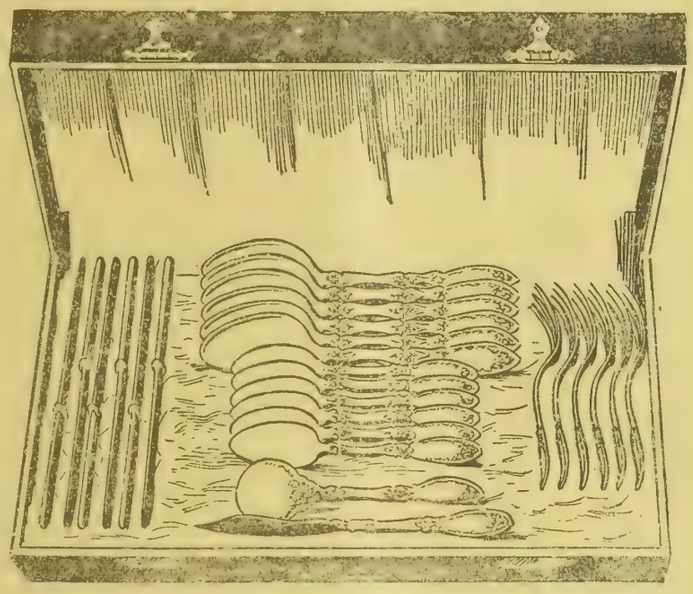
Napatho Soap.—A pure laundry soap, containing naptha and incorporated by a process that prevents it from hurting the hands, as other Napatho Soaps do. The wrappers count for premiums.

Scott's Fruit Syrups and Lime Juice.—Pure and excellent flavor. 10c, 15c and 25c. Coupon on the bottle.

Ebony Polishes—None better, both paste and lustre. Coupon on each box. Try them.

Sapid Tea.—A blend selling at 40c, in 1 lb. packages only. Blended by J. Harvey Brown, one of the most competent tea men in Canada. Each package carries a coupon equal to 8 soap wrappers.

Dr. Scott's White Liniment.—The largest bottle and best liniment. Price 25c. Equal to 5 soap wrappers.



Banner Spices.—In packages only. Absolutely pure. ¼ lb. packages carry coupon equal to 2 soap wrappers.

Venus Floating Soap.—Made from pure vegetable oils and unexcelled for the toilet and bath. Price 25c. Coupon counts for premiums.

Banner Flavoring Extracts.—All flavors and from 10c to $1.25 per bottle. Coupon on each bottle.

Herner's Dyspepsia Cure.—The only kind that tells you to eat what you like while taking it. Money back if not good. Price 35c. Equal to 7 soap wrappers. Price $1.00. Equal to 20 soap wrappers.

Brown's Stomach and Liver Pills.—A good family pill. Price 25c. Equals 5 soap wrappers.

Scott's Furniture Polish.—Renews the life of old furniture. Price 25c. Equals 5 soap wrappers.

Asepto Soap.—Is equal to the best and contains the same antiseptic features that Asepto Soap Powder does. The wrappers count for premiums.

Scott's.—Nitre, Glycerine, Iodine, Iron, Squills, Friar's Balsam, Carbolated Oil, Camphorated Oil, Castor Oil, Sweet Oil, Oil of Tar, Sewing Machine Oil, Spirits of Camphor. Price 10c per bottle. Equal to 2 soap wrappers.

Asepto Soap Powder.—Has been the greatest success of any soap or powder ever put on the market. This is the best evidence of its quality. It is antiseptic as well. It absolutely sterilizes every article washed. Think what this means to a family. Price 5c, and the trade mark counts for premiums.

The following stores are now in a position to explain to you what this offer means :—McLeod & Spence, Port Elgin, N. B.; F. L. Rayworth, Bayfield, N. B.; W. H. Useful Medicines for the Farm.

Keep a Supply for Emergency Cases.

ON the farm it often happens that medical attendance of some sort is required for the stock before there is time to get a veterinary surgeon or even send to the nearest town for drugs. This is more particularly true of a new country where veterinary surgeons are but thinly scattered and many farmers live a long distance from town. Under such conditions the prudent farmer will try to make as good provision as possible against loss from accident and disease among his stock, and the first step toward this end is to acquire at least a rudimentary knowledge of the treatment of the more common diseases and of the medicines used in connection therewith.

Numerous inquiries have reached us lately on this subject, and it is one to which every farmer could well afford to give considerable study, as a little knowledge of the elements of veterinary science may mean the saving of many dollars. The subject is well taken up by the Mark Lane Express Annual and our readers will find much valuable information in the following article from that authority, which has been modified slightly to meet the requirements of the general farmers:

KEEPING MEDICINES IN STOCK.

There are several forms in which a stock of medicines may be kept, and it is not easy to decide which is the best under all conditions. One plan is to get a number of mixtures of drugs made up by the chemist, according to some recognized formulae, and keep them ready for immediate use, of course tightly corked and sealed, and properly labelled. Examples are drinks for colic in horses fever mixture for the same class of stock, cleansing drinks for cows, scour mixture for calves, lambs and young pigs, and dressing for minor wounds and injuries.

Another plan is to stock the preparations sent out in compact form by well-known firms of animal medicine vendors, whose medicine-chests with specific remedies for the common disorders of the several varieties of the animals of the farm, frequently prove an immense boom to those living in isolated places and remote from professional assistance. The objections to this plan are, however, that the composition of the remedies are the secrets of the proprietors, and many men very properly want to know what they are giving to their stock.

A third plan is to ask the veterinary surgeon usually employed to supply a small stock of mixtures for the different common disorders of animals. These shodld be accompanied by plain directions for use and when the emergent case has become chronic, or has proved of a character obviously requiring professional skill it is then easy to say to the veterinary surgeon on his arrival, "I have given one or more of your drinks," when he will be in a better position to decide what further measures to take than if something of unknown composition had been administrated.

The fourth plan is to keep a stock of the more common and useful drugs in separate bottles or receptacles, with a glass measure or two, and weights and scales for compounding them as occasion may arise. The difficulty here is that the making up of prescriptions or the compounding of drugs is not exactly part of the farmer's training; while the drugs, unless carefully stored and renewed from time to time, are apt to deteriorate, and those of a more volatile character may lose their power altogether.

It should be made a rule that all fluid drugs of volatile character, such as the various tinctures, spirit of camphor, sal polgtile, sulphuric ether, sweet spirits of nitre, etc., should be kept in stoppered bottles in a closed cupboard, and that powdered drugs should be stored in tins or wooden boxes with closely-fitting lids. When liquids are kept in ordinary bottles, corks are liable to become eaten away, and the contents evaporate.

Attention, too, should always be paid to the condition of labels, and to the dryness of the store. When labels drop off, doubt may arise in process of time as to the nature of the contents, and without the trained memory, eye and nose of the chemist, the stockowner must either throw the stuff away or take the risk of making mistakes, which, needless to say, should never be accepted.

A word here as to the care of poisons. On some farms one often sees enough poison lying about unprotected to destroy all the human and half of the animal population of the parish—arsenic, wheat dressings, sheep dip, etc., being commonly left about in loose packets with partly or wholy obliterated labels.

All poison drugs should be plainly labelled with their names and the word poison written large, and be kept under lock and key.

SOME STANDARD MIXTURES.

With regard to the form in which the stock of useful medicines shall be kept, it is best left to the individual to decide according to his circumstances. We subjoin several useful formalae, for the benefit of those who prefer mixtures for specific purposes.

Perhaps the mixture most frequently needed in emergencies, which may occur more especially at night, is one for colic or gripes.

A useful prescription for a colic draught is:—Oil of turpentine, 3 ozs. tincture of opium, 1 oz.; linseed oil, 1 pint. Give the draught as it is, followed by some gruel, and if necessary, repeat it in two hours, but hours, but not more than two doses should be given. Wqlk the horse about, rub the belly with wisps, and generally take measures to prevent the animal getting down and rolling. The special advantage of this mixture is, that if tightly corked and sealed, it will keep good for years. Chlorodyne is now largely employed in the treatment of colic and so is chloral hydrate. Preparations of ammonia and sulphuric ether are useful in the flatulent (windy) variety of colic.

A fever drink, useful in chills and colds in both horses and cattle, and for horses after a hard day's driping, is:—Extract of belladonna, 1 drachm; nitrate of potash, ½ oz.; chlorate of potash, ½ oz.; sweet spirit of nitre, 1 oz.; spirit of camphor, ½ oz.; solution of acetate of ammonia, 2 ozs.; water 8 ozs.

As a cleansing drink for cows, give:— Carbonate of ammonia, ½ oz.; powdered aniseed, 1 oz.; Epsom salts, 12 ozs. Give in one quart of gruel

Condition powder, for horses when blotchy in their skins, or changing their coats:—Sublimed sulphur, 4 ozs.; nitrate of potash, 3 ozs.; powdered gentian, ginger, aniseed and fenugreek, of each 2 ozs.; powdered capsicum, 1 oz. Dose, one tablespoonful occasionally in dampened food.

Calve cordial:—Prepared chalk, 2 ozs.; tincture of catechu, 1 oz.; tincture of opium, 1 oz.; essence of peppermint, ½ oz.; water to 12 ozs. Dose, one to four tablespoonfuls, preceded by a full dose of castor oil. Lambs and young pigs suffering from scour may receive a teaspoonful to a tablespoonful, according to age.

Dressing for cuts:—A useful dressing for cuts and wounds is one part ol pure carbolic acid to thirty parts of olive oil, while a slightly weaker mixture makes an excellent lubricant and antiseptic for use in all cases of assisted or difficult parturition.

Another lotion, excellent for hardening shoulders and backs is:—Powdered alum, 1 oz.; sulphuric acid, 1 drachm; water, 1 quart.

No stable medicine chest is complete without a bottle of embrocation, but it is a safe thing to say that the abuse of such preparations has wrought more harm than they have done good in their legitimate employment. The mistake made is in applying embrocations with considerable friction to recent sprains or injuries, instead of first reducing the inflammation which always follows an injury. Hot water fomentations, or cooling lotions, should be employed first, then the embrocation when the inflammation has abated, or the chronic stage is reached. Some skill is required in compounding the mixture of turpentine, acetic acid, ammonia, etc., of which most embrocations consist, so as to make an elegant and stable mixture, and it is better to buy the widely advertised preparations in common use, and sold by chemists, than to attempt its domestic manufacture.

With an example of a simple blister for the horse, we may complete our list of useful stock mixtures:—Powdered cantharides, 2 drachms; camphor, 5 grains; oil of lavender, 10 drops; lard, 1 oz.

For splints, spavins, ringbones, and solid enlargements generally, whose absorption is desired, a preferable mixture is one part of biniodide of mercury to seven parts of lard.

In using the blister, the part should be first clipped closely and the ointment vigorously rubbed in with the palm of the hand against the direction of the hair for four or five minutes. The head must be tied short and precautions taken to prevent gnawing or rubbing the blistered surface until the irritation has passed off.

In twenty-four hours the skin should be thickly smeared with clarified lard, and the dressing repeated from time to time until desquamation (the scaling off of the scarf skin) is complete.

THE MOST USEFUL MEDICINES.

In compiling a list of the most useful remedies for live stock ailments which a farmer might wisely keep for use in simple cases, and prior to the arrival of the veterinary surgeon in those of a more serious nature we should include:—

Tincture of Aconite (Fleming)—Sedative (something that depresses the nervous and circulatory systems) and diaphoretic (induces sweating) useful in cases of exalted temprature; horse, 5 to 15 drops; ox, 10 to 20 drops.

Aromatic Spirit of Ammonia (Sal volatile). — Diffusible stimulant, antispasmodic (remedy for violent contraction of muscles or spasms) and

antacid (remedy for acidity of stomach); horse, 1 oz. to 2 ozs.; ox 1½ ozs. to 3 ozs.; sheep, ½ oz. to ¾ oz.

Carbonate of Ammonia.—Difiusible stimulant, anti-spasmodic and antacid, useful in cases of bloat in cattle; horse, 2 to 4 drachms; ox, 4 to 6 drachms; sheep, ½ to 1 drachm.

Aniseed—Stomachic and carminative (a medicine that tends to expel wind and remove colic); horse, 1 to 4 drachms; ox, ½ to 1 oz.

Aloes—Principal purgative for horse, 2 to 10 drachms according to size of animal; for foal seven months old 5 grains for every week of animal's age.

Extract of Belladonna.— Anodyne (something that allays pain), useful in chill, cold, sore throat, etc.; horse 1 to 2 drachms; ox, 1½ to 3 drachms.

Camphor—Calmative and anti-spasmodic; dose of spirit for horses, ½ oz. to 1 oz.; sheep, 10 to 30 drops.

Chloral Hydrate.—Sedative and anti-spasmodic, useful in colic; horse 2 drachms to 1 oz.

Cod Liver Oil.—Nutrient tonic, useful in debility and for light feeders; cattle, 2 ozs. to 4 ozs. in increasing doses.

Carbonate of Iron.—Mineral tonic and haematic (blood restorer and purifier); horse, ½ to 2 drachms; ox 1 to 2 drachms; sheep, ½ drachm.

Acetate of Lead.— Astringent (something that contracts the muscles) and sedative, useful in solution as a lotion.

Linseed Oil.—Safe laxative; horse, ½ to 1 pint; ox, 1 to 2 pints; sheep, ¼ to ½ pint.

Sulphate of Magnesia (Epsom salts).—Laxative and purgative, acts principally on the back bowels; cattle, ½ to 1 lb.; sheep, 4 to 6 ozs.

Tincture of Opium (laudanum).—Narcotic (something that relieves pain through producing stupor), sedative, anodyne, and anti-spasmodic, useful in colic in horses and cattle, and heaving or after-pain in ewes; horse, 1 oz. to 1½ ozs.; ox, 1 oz. to 2 ozs.; sheep, 2 to 3 drachms.

Nitrate of Potash (saltpetre). — Diuretic (something that increases the secretion of urine) and febrifuge (something that reduces fever), a useful medicine much abused by being given in too large dose frequent-repeated; horse, 1 to 8 drachms; ox, ½ to 1 oz.; sheep, 1 to 2 drachms.

Chloride of Sodium (common salt) —Tonic and vermifuge (something that destroys and expels worms); horse, ½ to 2 ozs.; ox, 2 ozs.; sheep, 2 to 4 drachms. Best given in the form of rock salt to lick.

Sulphur, brimstone).—Alterative and diaphoretic; horse, 1 to 4 drachms.

Sweet Spirit of Nitre.—Stimulant, anti-spasmodic, diuretic, and diaphoretic; horse, 1 oz. to 1½ ozs.; cattle, 1½ oz. to 2 ozs.; sheep, 3 to 6 drachms.

Oil of Turpentine.—Stimulant, anti-spasmodic, diuretic, and vermifuge; horse, 1 oz. to 3 ozs.; calves, 1 to 4 drachms; lambs, ½ drachm to 2 drachms.

Sulphate of Zinc (white vitriol).—Astringent, useful in lotions.

The powders of gentian, ginger, caraway, fenugreek, fennel, etc., belonging to the class of vegetable bitters and carminatives, are largely used for horses in doses from 1 to 4 drachms.

Great care should always be taken to give medicines time to act before repeating the dose or giving other drugs of similar class, and where domestic medication has proved unsuccessful, and professional aid has at length to be sought, a point should always be made of telling the veterinary surgeon exactly what has been given.

A Newfoundlander Visits the Winter Fair.

Mr Percie Johnson, who was visiting the Maritime Fair and Fat Stock Show, at Amherst, N. S., which was held on the days of the 5th, 6th, 7th and 8th inst., returned to town by yesterday's express. Mr. Johnson is a member of the Newfoundland Poultry Association and visited the show for personal and general information quaintance with Mr. S. J. Moore, who was here with Dr. Standish, and acted as judge at our initial Agriculture and Poultry Show in October last. Both these gentlemen were favorably impressed with our exhibit and since returning to Nova Scotia, have spoken highly of the possibilities of Newfoundland for raising cattle and poultry.

More than 1,500 birds of different classes were on exhibition; and, during the show, lectures were given by F. C. Elford, on "The Marketing of Poultry Products" and "Production of Eggs in Winter"; by A. C. Smith, on "Mating" etc., by Seth Jones, on "The Feeding and Care of Poultry"; and by J. P. Landry, on the "Poultry Houses and the Poultry Plants." The lectures were practical, and, to the man interested in poultry raising, most valuable. Some of the addresses were illustrated, and thus most helpful to the uninitiated.

Mr. Johnson, who sent exhibitions to our local poultry show, and succeeded in winning several prizes purchased some breeds of fowl, which won first and second prizes at the show in Amherst, which he will use for the purpose of improving local stock. He also made arrangements for the securing of a supply of best quality breeding eggs, at a price that will be within the reach of all interested in making our poultry as good as in other places. As to what is being done in the Provinces, Mr. Johnson mentioned the fact (and he also produced the evidence), that fowl hatched last May, weighed as much as 14 lbs. per pair when plucked and dressed, those returns being brought about by the scientific manner of producing and rearing, which result could be achieved here, in a very short time, if the people interested themselves as they should.

The Poultry Association, which is now most firmly established, will hold their annual meeting early next year, when Mr. Johnson's ideas and experiences will be made known to the members, and certainly with good results, as Mr. Johnson thinks it possible to improve local poultry stock during the next year or so as to make it compare favorably to that exhibited at Amherst.—The St. John's News.

Mr. Johnson speaking to the news said the exhibition was excellent and that the Committee in charge were the most eminent men of their profession to be found in the Provinces. During his stay, Mr. Johnson was made a guest of the Committee, and extended every courtesy. Among the Judges were: Professor Elford, of Macdonald College, and Professor Landry, of Truro College of Agriculture; and the hope of the Newfoundland Poultry Association is that these gentlemen will visit here next year. During his stay, Mr. Johnson also had the pleasure of renewing ac

The Imported Ayrshire Bull, Grange Kelly 30841.

Don't forget the dates of the annual meeting of the Nova Scotia Farmers' Association—January 24th, 25th and 26th at Windsor, N. S. Fellow farmer. if you want to meet a band of active, earnest businesslike farmers who will give you and your profession an uplift you should make up your mind to attend the convention.

How Can Alfalfa Growing Receive A Boost in the Maritime Provinces?

Drainage the Keynote to Successfu Alfalfa Growing.

Editor Maritime Farmer:

Your inquiry on how to boost alfalfa suggests many things. There can be no great object in direct government assistance to a proposition which ought to pay at the start. The growing of alfalfa is undoubtedly practical on any area subject to inoculation, provided the land be drained. By the provision I mean that even on our uplands we have hundreds of acres almost unfit to grow anything, let alone a deep-rooted plant like alfalfa. It must not be expected that alfalfa will grow where nothing else will. It will grow better than most other crops on well-drained land.

A province like this with a short season, a comparatively small area of plow-land, and the danger of a late, wet spring cannot over-estimate the importance of drainage in its relation to crop yield. Your issue of Nov. 22, contained a most valuable artirle on drainage which should be read by everyone and especially by those planning alfalfa tests. It does seem to me that a drainage campaign preceeding an alfalfa campaign by at least one year will do more to reduce the percentage of disappointments among the participants in the latter than any other one influence.

In getting alongside the man with the hoe as well as the stockman and the orchardman—in brief, in assisting all going schemes—the government might adopt the Nova Scotian plan, suitably modifyed, of helping the parish or even the individual farmer with the drainage scheme, to finance the undertaking. It will do more to get results all along the line and generally to improve land values than anything else that I see. Visitors never fail to be impressed with our scenery, but our patchwork fields do not look like farming as a business. Our average yields and our land values per acre, even in good sections look the same way. One of the great obstacles of the present admirable horticultural propaganda is the failure of some of the illustration orchards set some years ago. Not a tree should have been set on undrained land. Not a square yard of alfalfa should be seeded until the same thing is assured. No crop will do what it should on wet land and the wetness leads to the sourness and coldness of many areas which would otherwise be productive with any plant adapted to the climate. If alfalfa forces the need for drainage to the front it will pay for its boost. It may be found that we can handle crops now thought to be impossible and desired because of their value elsewhere.

H. R. ROSS.

St. John, N. B.

Try and try Again.

Editor Maritime Farmer:

I glean from your last two issues of the Maritime Farmer that you desire farmers to give their experience with alfalfa growing.

Trial No. 1. Four years ago I sowed five pounds of alfalfa seed, one half of which I treated with nitro culture. I sowed the treated and untreated seeds in adjoining plots that had previously been sown with wheat, drilled. After sowing the alfalfa seed I went over the ground with the horse rake. I could never find more than a dozen plants the first season and only one or two plants the following summer.

Trial No. 2. The next year I purchased four pounds of seed that the merchant said was alfalfa seed and I sowed it with my wheat using the seed box behind the drills. I mixed some alsike seed with it in case the alfalfa did not grow. I got a banner crop of alsike clover. I had to follow the mower and fork it away. The fact of the matter was that I had purchased alsike seed instead of alfalfa.

In the season of 1910, I bodght four pounds of alfalfa seed that had been carried over from the previous year, for which I paid ten cents per pound. This I sowed with my wheat the grass seed box behind the drill, and considerable of the alfalfa grew but it did not look well among the wheat. I noticed that the wheat did not sprout as early as the grass seed. When starting my drill a plot about four feet long and the width of the drill got seeded with alfalfa alone. The plants on this spot grew to a height of over a foot and looked nice and healthy while the plants among the wheat looked short and sickly.

My conclusion is that alfalfa should be sown at the rate of twenty lbs. per acre, on good soil, clear of the weeds. I did not treat the seed this year.

WM. ANDREWS.

Middle Stewiacke, N. S.

How Gau Alfalfa Growing Receive a Boost in the Maritime Provinces?

Every one of our farmer friends are asked to make suggestions. We will give them widest publicity possible. C. W. McDougall, Dairy Superintendent for New Brunswick, has demonstrated to us that Alfalfa can be grown successfully in New Brunswick. Have any of our Nova Scotia or Prince Edward Island friends been able to produce it? Is it worth trying to establish on our farms? Can the provincial governments do anything to encourage its growth? If so, what do you suggest? Is there any information regarding it that THE MARITIME FARMER can publish? Can we be of any assistance, if so how? A few suggestions for you to answer are asked with the hope that you will act at once. We want to hear from every farmer in Canada. You are at liberty to take up any phrase of the question that you see fit and are not confined to the questions we have asked. Address communications to

The Grade Holstein Cow, Fanny K.

Sweepstakes Cow in the Forty-Eight Hour Dairy Test, at the 1910 Maritime Winter Fair, Amherst, N. S. Score 149. Owned by T. W. Keillor, Amherst Point, N. S.

A Prince Edward Island Cow's Record.

Following is the yearly milk and butter fat record of the Jersey cow, Lady Grey, No. 804, owned by Frank Glydon & Son, Margate, P. E. I. Her age on October 1st, 1909, when her record started, was 2 years, 138 days. She dropped a calf prematurely on September 7th, 1910, and this of course mitigated agginst her, making a higher score for that month and lessening her total production.

Months	Lbs Milk	Lbs Fat
October	704	35
November	659	33
December	654	33
January	596	33
February	520	29
March	574	34
April	522	29
May	529	31
June	575	37
July	530	34
August	521	31
September	111	7

Total production 6495 lbs. milk, 364 1-3 lbs. butter fat, average test, 5.6 per cent.

Total production of butter 425 lbs. in 341 days.

Messrs. Glydon have a very nice herd of pure bred Jerseys. They are addng quantity and quality to the numbers of their herd and the fact that an accurate record is kept of each cow's production is ample proof that they are progressive, wide awake dairymen, who are bound to succeed. Mr. Frank Glydon has taken a course in the Provincial Dairy School, Susses, and manufactures a gilt-edge product.

Injured Ear.

D. A. S., N. B.:—I have a horse eight years old, that was bitten by another horse, two years ago. I never done anything for it and it will not heal up but keeps running a little every day. Just enough to keep the side or edge of the ear, where he was bitten, dirty. One horse doctor said there were some hairs or something healed over that made it run and he would have to be thrown and the place scraped. Another said it was a little abscess that was causing the trouble. Will you please tell me in the Maritime Farmer, what you think I had better do to heal it.

Ans.—There is probably a small sack at the base of the ear with a pipe leading from it both of which should be dissected out, leaving an opening at the lower part of the sack to allow easy escape of any accumulation that may occur. Bathe the part daily with warm water and some antiseptic, such as a three per cent solution of creolin or carbolic acid. If at all convenient, have a veterinary surgeon attend to it, as a knowledge of the anatomy of the part will enable the operator to avoid injuring important organs surrounding the part.

J. STANDISH, V. S.

MEMORIES OF THE COUNTRY LITERARY SOCIETY.

The following memories of the Country Literary Society by C. V. Gregory in a recent issue of the Twentieth-Century Farmer contains some suggestions that could be profitable carried out by every rural community in the Maritime Province:

"One of the brightest memories of my boyhood days is that of the country literary society. Here on Wedsesday night all the people of the countryside, old and young, met to listen to the weekly program. No night was too stormy to keep the people away. The literary society meetings were the big social events of the community—almost the only ones. The two hours of whole-souled entertainment furnished topics for conversation for the ensuing week, and many a good hearty laugh to boot.

"The young people were kept busy planning and rehearsing. The better the entertainment became, the larger were the crowds; and the larger the crowds the harder the young folks worked in order that the audience might not be disappointed. The society started in the school house, but soon outgrew that and was transferred to the town hall. Even that was far too small, and often people came for six or eight miles only to find themselves lucky if they could get their heads inside the door.

"Nor was the business of filling the programs left entirely to the younger people. Old farmers waxed eloquent over the merits and demerits of the dual purpose cow. The village doctor was one of the star debaters. His chief difficulty was in getting started. Knowing his weakness, the weakness, the chairman often charitably forebore to warn him at the end of his ten minutes, in order that he might have time to arrive within speaking distance of the point he was trying to prove. The preacher occasionally consented to be drawn into a debate, and he and the doctor would tear the question to tatters, great to the delight of the audience, who would often encour them for two or three rebuttals apiece.

"It was hard work for the officers, but the experience was well worth it. One virtue that it developed was self-reliance and a readiness to meet emergencies. When the clock struck eight with half the quartet, two debaters, and the hero of the one-act play all absent—well, that was one of "the times that try men's souls." The president and treasurer were always ready to fill in the missing place on either side of the debate, and the faithful secretary was ever ready with a solo or a reading. Many were the cries that were met and averted behind the curtain of the little stage before the tap of the bell that started the meeting, but to the credit of the officers be it said that no one ever went away disappointed.

"As the years went on the old literary society died and was revived a number of times, until finally it became so dead that all efforts at resuscitation failed. This brief history is typical of most of the old time literary societies and lyceums the country over. For some reasons or other many of them have lost their place in the country community. This would not be so bad if anything better had taken their places. In most cases their places have been filled by nothing at all. Except for an occasional dance or party there is little going on in the community. The young people long for something to do, but there is no one to go ahead.

"In most country communities a well managed literary society could be made to fill a large place. There is no secret about the management of such an organization, unless it be plenty of hard work. The first thing to do is to get the people together and organize. It is better to have a good program the first night, so as to interest the people and start things with plenty of enthusiasm. Aside from faithful work, enthusiasm is one of the greatest factors in the success of a literary society. It is a good plan to have the constitution made out in advance. It does not need to be anything elaborate. Provision for officers, committees, and a brief outline of their duties—these are the principal things needed. Get the business adopting the constitution and electing the officers through as rapidly as possible, and this is rather dry work at best. Be careful to get the best possible men for officers, as upon the interest taken by the officers will depend the success or failure of the society.

"In arranging programs, make them interesting above all else. If you entertain the people they will come again, and say a good word for the society in the meantime. If you make the programs too instructive at the expense of interest, you are liable to lose your audience and see the society end in failure. This does not mean that the entire program must be of a light nature. There is a place for an occasional instructive talk or debate, but, good, wholesome humor should predominate. Have as your principal aim to interest the people and make them forget their troubles, and ten chances to one the society will be a success.

"Make the programs as varied as possible. A debate is good almost any time, provided an interesting subject is chosen and the debaters all come. Readings and Recitations are always good. It will generally pay the program committee to have a supply of material on hand to give you, in order to avoid the excuse that "I couldn't find any piece." A bright one-act play or dialogue always takes, and the younger people get a great deal of fun out of practising. In our old society we used to have a longer play once during the winter, to which a small admission fee was charged. The money obtained in this way was used to pay the expenses of running the society. No membership fees or admission fees to the regular meetings were charged. We had a list of members, however, enrolling everyone who would promise to take part in the programs. The roll was called at the beginning of every meeting. This did not take long, and helped to keep the members interested.

"The proceedings may be varied occasionally by having an outsider in to make a short speech—a man from the extension department of the Agricultural college, perhaps. A debate with a rival literary society is a splendid way to arouse enthusiasm. At such an occasion a few good yells help to lend spice to the occasion.

"In every way a well conducted literary society is a benefit to the community. The literary society is one of the most potent factors in developing community spirit, and if there is any one thing that the rural neighborhood need more than anything else, it is more community spirit."

DOES IT PAY TO ADVERTISE?

Yes, it pays to advertise. But all persons who advertise are not advertisers. Some convey the idea that they are new in the business or industry they represent by the placing of a small advertisement, apparently an experiment, "To see if it pays." They do this without considering that they are creating the impression among would-be-buyers that the article advertised is of little importance, as the advertiser shows his lack of confidence in the article he has to sell by the way he advertises it.

When an article of merit is set forth in an advertisement in an attractive way the impression goes out that the advertiser has something of value, in which he shows his appreciation of his goods by the liberal and positive way he advertises them. The occasional advertiser is not getting the advertising advantage that his business merits, if he is building up a permanent industry. It is worth considerable to have the readers of a paper all familiar with your name, address and what you represent in your business. The all-year advertiser soon becomes fixed in the minds of the readers in such a way that they can readily name him when his line of goods is mentioned.

A business card run consecutively in each issue of the paper you do your special advertising in is of great value in establishing the character of the product you have for sale. The in and out advertiser is too apt to be classed an in and out producer or breeder.

Another mistake made by some persons is to advertise for a few years, then drop out and attempt to sell on the reputation they acquired during their period of activity. This is a losing proposition, since the world is moving too fast to follow up any missing links or to even inquire "What has become of Jones?" They simply turn to the advertising columns of their paper and look up a real live man, who is serving notice on the public that he is on deck and doing business at the old stand.

Advertise, because it pays. But do it judiciously, carefully, fairly and in a way that will attract the attention of inquirers and prospective buyers. A well written advertisement is half the sale.

CO-OPERATION NECESSARY

It is almost useless for anyone about the home to attempt to improve or beautify the place without co-operation of other members of the family. If the women make flower beds and try to keep the lawn in order, their efforts are useless unless the men keep the fences in repair so that the chickens are excluded. Gates are useless when children forget to close them. A nail now and then will keep things in order, while a day or more may be necessary to put them in order. By no means is it always the fault of the men that the place is disorderly. The woman's realm may be the kitchen, but it extends also into the doorway. If a man repairs the loose flooring on the back porch he will be discouraged to see it cluttered with a collection of mops, brooms and tubs, with perhaps an uncovered pail of dish water around which the flies are swarming. The home is the home of the whole family and eyeryone is responsible for its appearance. Try, sometimes, to get a detached view of the place, to see it as a stranger would, and find out how it can be improved and for what part of the improvement you are responsible.

Ice On The Farm.

The importance of ice on the farm is a subject that the farmer cannot lightly turn aside or overlook in these times of sanitation and improved methods of living and observing the rules of health. Customs which prevailed twenty years ago on the farm or ten years ago do not necessarily follow today. This is an age of progress and improvement, and the demands of the times are to keep step with everything that tends to a bettering of humanity in health, morals and social standing.

It is a fact that on the farm there has not been sufficient attention paid to the things that are conducive to the highest standard of health and physical comforts.

On the farm, where ice is most needed in the summer, there is the least attention paid to providing it. The loss about every home because of a lack of good, clean, cold storage through the heated season for the food products that the family uses each day is much more in one season than the cost of an ice house and ice supply. This is especially true where there is any attention given to milking and the handling of cream or butter. Those who have not been accustomed to using ice in the heated period cannot appreciate its advantages.

The saving of eggs and butter by use of ice is much more than can be estimated without actual experience in its use. Ripe fruits and fresh vegetables of all kinds retain their freshness and freedom from evidence of decay by the use of ice, in ice chests, boxes or refrigerators. This saving in table supplies soon amounts to a sum that will go a long way in the construction of an ice house on that farm. It is authoritatively stated that much of the summer ailments of children, and adults for that matter, are traceable to poisons created from decaying foods from lack of ice or proper temperature to sufficiently preserve them.

When convinced of the value and utility of the ice supply for summer use, then arrange for putting up the ice. Dam up the little stream, if one is on the farm, and make a basin to hold the gathered water supply. It is not a good plan to take ice from basins that cannot be readily drained or to use the water in making ice that has stood in these basins or where stock has been permitted to have access to the collected water. There is no real good ice supply, except from water of the clear, running brook. This may be arranged so that it may be dammed up in the early winter, then when the ice has been stored let the dam drain off.

There will soon be ice everywhere, but if there is no preparation made and no ice house to store it in there will be no ice on the farm next summer, when it will be greatly needed for the milk and butter storage.

Use of Oilmeal.

"Oil cake or oilmeal in proper quantities is considered by our best stockmen to be one of the most healthful foods that is on the market," states Prof. G. C. Humphrey, of the animal husbandry department of the College of Agriculture of the University of Wisconsin. "Its value is that it keeps the animal in the most healthy condition, no other feed having such a beneficial effcect on the digestive tract.

"The price of the feed is considered prohibitive by many farmers, but considering the fact that it contains nearly 30 per cent. digestible protein the stockman can well afford to pay the market price in order to have at least a small quantity of the feed available.

"Old process rather than new process oilmeal should be secured, so far as possible, for the reason that 94 per cent. of the protein in the old process oilmeal is digestible as compared with only 84 per cent. of the new process meal."

"Oilmeal may be fed to all classes of farm stock," continues Prof. Humphrey. "Fattening steers will use to great advantage from two to three pounds of oilmeal daily in connection with other feeds. Larger amounts can be used profitably when prices are not too high. Feeding oilmeal in the form of nut-sized cakes is considered preferable to the loose meal by most of our steer feeders.

"Dairy cows will consume one or two pounds of oilmeal daily with their grain rations and during the winter feeding period more or less oilmeal is almost indispensible in order to keep the cows in the best condition for producing milk and butter fat. For growing calves, sheep and hogs oilmeal can constitute about one-tenth of the grain ration fed, and prove very beneficial. Horses may be fed small quantities, although its general use for horses is not recommended."

Concrete Drain Tile Machine.

For the core a 5-inch length of stove pipe is used. This is cut 20 inches long, or 2 inches longer than the tile is to be made A circle is cut from a board to fit into the bottom of this pipe, where it is fastened. In the centre of same a bolt is placed which acts as a pin, going through the molding board or pallet and thus insuring setting the core in correct position. The top is finished with a block to fit into same, with a ring and bolt to draw out core from the complete tile.

The outside form is made of heavy sheet iron and is 8 inches in diameter and 18 inches high, which makes the walls of tile 6½ inches thick. This requires a piece of sheet iron 18x26½ inches in size, which you should have the tinner bend into a circle or cylinder form, with the edges overlapping each other 1 inch. Exactly 1 inchfrom each edge of the sheet nail two strips of wood, and to these attach hooks and eyelets, so when the form is together with the sheet iron lapped 1 inch the hooks are in position to go into eyelets.

This is placed over the core and held at the proper distance from same by little blocks nailed to pallet on the outside of form or by small nails driven into pallet. The mortar is placed in machine and thoroughly tamped down. The best mix for this work is one part cement to three parts of coarse sand used with as little water as possible, just enough to wet the concrete.

One machine will make a number of tile each day, as it can be removed from the tile as soon as molded by drawing the core first and then unhooking and removing outside form.

The average cost of 5-inch tile 18 inches long made as above is 8½ cents each; 6-inch tile 10 cents each, with sand at 75 cents per cubic yard, cement $2 per barrel and labor at $2 a day of 10 hours. This same machine may be constructed in larger or smaller size, as requirements demand.

Waste Occasioned by Average Handling of Stable Manure.

If farmers could be led to see the waste of fertilizing material by the careless handling of the stable manure, it is likely that there would not be so many manure piles lying out beside the barn, rotting and burning up valuable humus material and also sending valuable ammonia into the air. Yet there are those who are so neglectful that they likely would not change their methods, no matter how plain the loss was made to them. Stable manure is valuable for the nitrogen, potash and phosphoric acid it contains, and also for the vegetable matter that decomposing humus makes in the soil.

10 lbs. of nitrogen, worth	$2.00
10 lbs. of potash, worth	.50
5 lbs. of phosphoric acid worth	.25
	$2.75

Some of the best authorities on manure say that the vegetable matter added to the soil with the manure is worth as much as the plant food added by the application of stable manure to the soil. This would make a ton of fresh stable manure worth $5.50, but as it is usually cared for and applied, only about half of its value is realized. There are several good plans for saving the stable manure. The one which I would recommend and will suit the average farm and conditions is to draw the manure to the field and scatter it over the sod during the winter months. Then turn the sod under and plant it to corn. Many need the manure on their corn ground and the stable manure is especially well suited for corn, as it gradually decomposes and furnishes a regular supply of plant food for the growing corn throughout the season. The manure helps the soil to hold the moisture. I am persuaded that there is very little of the value of the manure wasted by this method, as the soil is ready to take up the fertilizing material as it becomes available. The manure rotting in the soil helps to make latent fertility already in the soil available and it furnishes material for soil bacteria to work upon. This makes the soil in better condition, besides furnishing direct plant food to the soil. The manure may be profitable during the winter as a top dressing.

Seaweed as Manure.

The storms of autumn and winter cause masses of seaweed to be cast up on the shores, and this should be utilized as manure wherever permission can be obtained to cart it away. For centuries the farmers situated near certain coasts have taken advantage of this cheap source of fertilizing material but in other parts it is wasted. Just because it is so plentiful at times it is apt to be neglected, but it is really an excellent manure. Samples differ widely, but the average may be said to be at least equal in fertilizing value to farmyard manure. According to an article by Dr. Russell, in the journal of the British Board of Agriculture, the fertilizing materials in one ton of fresh seaweed possessing the average composition would cost from $2 to $2.50 if purchased from a dealer; but it is worthy of note that in recent Scottish litigation in which a number of experts and practical farmers gave evidence, the value was put by the arbitrator at $1.20 per ton. Thus there is considerable difference of opinion as to the actual money value of seaweed, but there can be no doubt as to its being a good manure. In farm practice it takes the place of yard manure, but it decomposes more rapidly in the soil, forming soluble substances which easily wash away. In trials it has proved fully as effective as yard manure for early potatoes, but it may be expected to show to great advantage on such gross-feeding crops as mangolds and cabbages. It is best carted on to the land when fresh and immediately ploughed in, but it is sometimes allowed to rot in heaps, either alone or mixed with farmyard manure. In Scotland the fresh seaweed is applied in autumn at the rate of twenty-five or thirty tons per acre, and in Jersey as much as forty-five tons per acre are used. It may be supplemented by artificials in the same way as is farm-yard manure.

Potatoes From Seed Balls.

Late last spring I planted out of doors a few potato seeds taken from potato seed balls or apples of the fall before. July 8 I transplanted to the garden 20 of the little plants. None of them were over 3 inches high. I was made fun of for doing it, and was told that I'd be lucky if I got anything at all. The summer was very dry. That was, of course, against them.

The potatoes were dug the last of September, all white ones. This is what I got from the best 10 hills:

Hill No. 1 weighed 43 ounces. Ten potatoes from the hill weighed 35 ounces, seven 30 ounces, five 26 ounces and the best four 22½ ounces.

Hill No. 2: Total weight 36 ounces. Eight potatoes weighed 28 ounces; best five 23 ounces.

Hill No. 3: Total 34½ ounces. Ten potatoes weighed 28 ounces, five 18 and best four 15½ ounces.

Hill No. 4: Total yield 27½ ounces. Ten potatoes weighed 24 ounces; five 17½ ounces.

Hill No. 5: Total yield 21 ounces. Eight potatoes 20 ounces; best five 14 ounces.

The total yield of other hills was as follows: No. 6, 21½ ounces; No. 7, 20 ounces; No. 8, 19½ ounces; No. 9, 19 ounces; No. 10, 17½ ounces.—G. F. Hill, in New England Homestead.

The Blacksmith Shop.

The blacksmith shop should be on every farm and the owner should be skilled to a certain extent in the art of using the various tools. The farmer who has a shop with a bellows and anvil can do many a job that would otherwise necessitate a trip to town.

Now that the winter is approaching and the farmer has leisure on his hands he would do well to build a small shop and during the long winter months acquaint himself with the use of the hammer and anvil. The shop will furnish an excellent school for the farm boy, who in a short time will become quite proficient in making articles of use on the farm. Many farmers of the West have become expert blacksmiths and do all or nearly all, their own work, even to horse-shoeing. Though these farmers are probaly an exception to the rule, there is nothing to hinder any man sharpening his own plowshears, mending broken pieces of machinery, and doing scores of little things about the farm. Many an article goes to waste on the farm simple because of some trivial breakage which the farm boy could readily fix if the farm were provided with a shop.

As a boy, on the farm, I spent most of my spare time during the winter in the blacksmith shop and fashioned many useful articles for use as well as repairing broken implements.

The blacksmith shop will keep many a boy on the farm, while in others it may develop the latent talents of a practical machinist. It furnishes recreation from the daily routine of doing chores on the farm and employs the time of boys who would otherwise be idle because of their having no place to go.

HORTICULTURE

Pruning Fruit Trees.

1. Prune heavily when the tree is young, so as to give it the framework desired.
2. Quit pruning when the tree gets older.
3. Cut off the fruit spurs from the main branches just as soon as they form.
4. Practise summer pruning on the older trees.
5. Do all you can to discourage wood growth.

Do not be afraid of taking the fruit off the tree when you are summer pruning. Prune down until you have a reasonable amount of fruit left, and do not leave too many. Thin after you prune. The pruning is used largely as a thinning.

You can advantageously prune the pear tree during the first summer. Select and cut to the "outer buds" on the branches, so as to throw the frame work of the tree outward. Save twelve inches of clean, clear stem. Select a good strong bud on the inside of the middle limb, and seek constantly to turn the growing branches outward, so as to make an open strong top through which the sun's rays will penetrate and the air circulate freely.

At the third pruning commence to remove every indication of a fruit spur from the main stem. Keep them off entirely in a circle reaching over half the top of the tree. Prune very hard up to the fourth year and up to the beginning of the growth of the fifth year. From this time on you are to prune for fruit. Do nothing to accelerate a heavy wood growth after the four years of growth. We would change as quickly as the season changes from one system of pruning to the other; that is, change from winter pruning for wood to summer pruning for fruit. We follow this system with pears in order to produce a hard wood which is resistant to pear blight.

After the change from winter to summer pruning, do just a little pruning during the winter season, cutting out all crossed and diseased branches, but leave most of the pruning for August. This is after the trees are four years old.

In the case of a four-year-old pear tree which has not had the severe cutting back as outlined above, and if it is a well-grown tree, practise summer pruning at the first opportunity. If it is not well grown or properly formed, we would do a little winter pruning to get the branches in desired places. A healthy pear tree can be cut back severely.

In the case of cherry trees you will have a very strong wood growth, straight and upright, a one-year-old tree sometimes reaching the height of five feet. Usually it has lots of good, strong buds all the way up. It may have a branch or two. If it is a straight switch, we cut it off 20 to 36 inches from the ground. We want the branches as far apart as possible on account of gumosis. If cherry branches are all together in a case of this kind the load will become too heavy. Cracking and splitting will ensue, and the tree will become subject to gumosis. As the limbs increase in size, they will all crowd together, splitting and cracking.

Cut back the cherry tree as severely as you do the pear tree for the first four or five years. With cherry trees you do heavy pruning for wood when the leaves are off the tree, and the last pruning is done in the spring. Injury may happen to your sweet cherries by freezing or thawing, in which case we let them stand until the bud starts in the spring. Then we prune. The essential points are:

1. Prune heavily while the cherry tree is young.
2. Get good, strong active growth.
3. When the trees are three or four years old, change to summer pruning almost the same as you do with the pear.
4. Instead of pruning just before the crop is harvested, prune to correspond to the time just after it is harvested.

The Bing cherry, if given half a chance, will hold its leaves late in the fall, until the first heavy frosts. The cambium layer of wood is in this way killed. In the spring such a tree will start out just as usual, and will then die. Do not permit the tree to grow too late, but harden it up so it will lose its leaves early in the fall. Irrigating too late in the fall may produce this trouble.

In setting out peach orchards we prefer June buds, though the use of yearling trees is not discouraged entirely. Cut the June bud from 12 to 15 inches of the ground. Prune it severely. The yearling trees may be 12 to 15 inches, or even two feet. Cut them back severely. On rich soil a growth of three to five feet will take place the first season. Three to five branches are all that is necessary in the framework of a peach tree, though five to seven are used in other trees. Treat sour cherries the same way, using a little bit longer stem. The sour cherry will not get high anyway. Prune very much the same as you do for apples, leaving them a little longer than the apples. Frequently we leave these 18 to 24 inches in length. We pay very little attention to the small branches that appear. Just let them stay as they are. Suppose you are planting a one-year-old peach tree, and it has a lot of branches on it. You may treat them in two ways: (1) Cut these off close to the stem, not injuring the little bud on each side of the stem, of course; or (2) strip them off two inches in length. Either way will give satisfactory returns. Then get the large branches headed back. Do not "shear" the tree. Prune it—Prof. W. S. Thornber, in The Fruit Magazine.

Cover Crops in the Orchard.

Cover crops and their value in orchard practice is one of many important operations in orchard management which should receive more attention if we hope to produce fruit economically. The three methods of culture usually recommended are: First— The cover crop method; Second—The clean culture method; Third—The sod mulch method. There are some who advocate growing trees in sod but this is an unwise method. It is adaptable only to very exceptional conditions, and should not be recommended.

The cover crop method briefly is to cultivate the ground from early spring until the first of July, sufficient to keep a fine earth mulch on the surface, and at the time of the last cultivation seed to a cover crop that will produce a good mat of vegetation to work under either in the late fall or the following spring. The clean culture method is similar to the above except that no cover crop is grown and the ground is left bare, or to be occupied by an occasional weed after the last cultivation early in July.

The sod mulch method is to mulch usually with manure, the area occupied by the tree sufficient to prevent great evaporation from the soil, and to keep all grass or weeds cut, not allowing them to grow taller than six inches and letting this material also remain as a mulch. This practice is advisable if conscientiously followed especially on hilly, rocky or very open gravelly soil, but what some growers practice and call the sod mulch method I would call the large hay crop method.

If the clean culture method is followed some means must be adopted to get humus into the soil. Without humus our soils become unproductive Humus not only aids in conserving moisture but gives as well a better mechanical texture to the soil. It lightens up heavy soils and makes an open soil more compact. Humus in the soil assures an ever present supply of nitrogen, and prevents the leaching from soils of potash and phosphoric acid. Bacterial life in the soil is largely dependent upon humus and we must not forget that these lowly forms of life are large factors in rendering a soil productive.

Commercial fertilizers do not add humus to the soil. They can be used most economically only on a soil not deficient in humus for otherwise a continuous supply of available food material is not within reach of the plant. I do not mean to say anything against the use of commercial fertilizers for they can be used to advantage by the orchardist. But what I want to impress upon you is that humus in some form is essential and if the clean culture method is followed, stable manure or litter of some sort, must be used to furnish it. Manure is not available for many growers and, besides, if cover crops can be grown in the orchard to supply the humus, and not to be a detriment but rather an advantage to the growing tree or ripening fruit, why not make use of it?

Many orchards are located on hillsides and if cultivated a serious washing may occur during the fall or early spring rains if not prevented by means of a cover crop of some sort.

Nitrogen, one of our most costly elements of fertility, may be largely supplied through a leguminous cover crop and the purchase of fertilizers confined to the potash and phosphate manures. If clean cultivation is followed this free nitrogen cannot be secured. The above reasons are, I think, sufficient to warrant one in advocating the cover crop method of orchard cultivation.

RIPENING THE WOOD.

Another phase of the subject, is the proper ripening of the wood for winter. Winter injuries may result from improper ripening of the wood or it may be due to improper nourishment. Instances of the latter are found in cases where there has been heavy fruitage which drains the tree of its vitality unless there is sufficient food available to supply the growing tissue as well as the fruit. Nature directs all her efforts first to the development of seed to perpetuate the species, and the tissues of the plant are supplied only after this want has been met. Were we to place within the reach of our trees food as required I think we should hear less about the winter killing of our bearing trees. The improper ripening of the tissues of a tree may be due to an excessive food supply, or excessive moisture conditions in the soil, or to a continued high temperature. The temperature and food supply are largely influenced by the mosisture conditions, although a combination of these factors is responsible for late growth.

The moisture conditions are in a measure within our control by the use of cover crops. In irrigated districts the grower has absolute control of this factor and can ripen off his trees when he wishes by the withholding of water. We have no such absolute control in the use of cover crops, for excessive rains at a certain period may largely counteract any drying effect we wished to produce through the use of a cover crop that tends to dry out the soil.

EFFECTS OF COVER CROPS.

The following table will give some idea of the relative drying effect of various cover crops. These experiments were conducted in our young orchard and show the percentage of moisture in the soil in the middle of September: Millet, 7.24; Oats, 10; Rape, 10.1; Winter Rye, 11.6; Crimson Clover, 11.8; Buckwheat, 11.8; Red Clover, 12.3; Vetch, 12.8; No Cover Crop, 14.9.

It will be noticed that the strong growing cereal crops and rape will run down the moisture contents of the soil very rapidly and for this reason they may be advisable in some cases. The oat crop had four per cent. less moisture than the check plot growing no cover crop. Crops that form a dense math prevent evaporation from the soil and this is one reason probably why the clovers and vetch do not so materially reduce the moisture contents. It was found also that the quick growing cereal crops reduced the moisture of the soil earlier in the season than the clovers, especially than the Red Clover, which requires a longer period to form much leaf area.—Prof. S. Blair.

Gourlay Pianos
THE PRIDE OF OWNERSHIP
To own a Gourlay Piano is to be proud of your piano. If you are a musician, the sympathetic bond between you will be strong indeed, for a Gourlay piano responds to every mood of the player. There is a crispness and delicacy of tone for the daintiest improvisation and a richness and volume for the most exacting bravura passages.
If you are not a player, but a lover of music, the pleasure of your friends' enthusiasm will more than repay you for the amount of your investment, to say nothing of the extra years of service over an ordinary piano. Write for Catalogue and prices.

Boxes Versus Barrels.

There are so many apple-growers and dealers in Eastern Canada who are slow to recognize the advantages of modernizing their methods, putting up their fruit in convenient and attractive packages, and thereby increasing their profits, that the following extract from a letter received by the management of the First Canadian National Apple Show from Mr A. Chalmers, Jr., who is at present in Canada in the interests of his firm, Messrs. Andrew Chalmers, of Albion Street, Glasgow, Scotland, and Les Palmes, Grand Canary, should be read with interest. Mr. Chalmers says in part;

"I am pleased to know you are having an Apple Show, and do truly wish I could see my way to represent my house. But, you know, we are busy here, and one can hardly leave this district in October, as we are operating extensively in Ontario and New York State this year.

"Apples from the Pacific have a great reputation in the Old Country, the quality being good, and the fruit honestly packed in boxes.

"The more boxes of apples shipped across the Atlantic, the greater will become the consumption. Retailers of fruit and private buyers alike are tired of buying apples in barrels and being deceived with dishonest packing and poor grading.

"There is a great future for British Columbian apples in the old land, and I trust your growers will become shippers, and take advantage of our markets.

"We sell by private sale, and will be pleased to correspond with any of your exhibitors."

Hide-Bound Apple Trees.

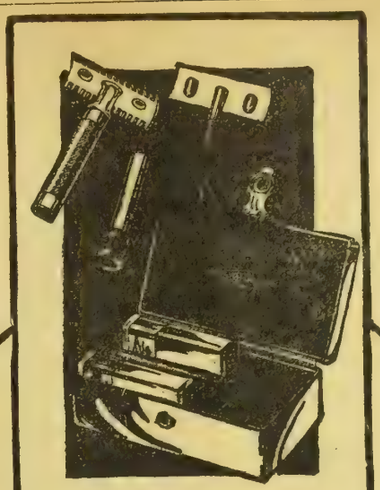
Quite often old or neglected apple trees become unproductive, yielding few, if any, salable apples, and make but little perceptible growth. The expert orchardist calls this condition "hide-bound."

During the summer months, when new wood should be forming, it is a good plan says Agricultural Epitomist, to rub or peel the old bark from the ground to the first limbs, and a new, smooth, healthy bark will appear and many times this will have so salutary an effect that the old tree will go to bearing. We have seen trees treated in this manner with very satisfactory results, especially when the trees were not too old or were not injured by removing the old bark.

A number of years ago we made a night pasture of one of our apple orchards and kept from thirty to forty dairy cows in this orchard nights, feeding them grain and soiling crops from the stable. They kept the old bark well rubbed off the trees and left a large amount of fertility on the land, and from this orchard we have harvested some of the best crop of apples we have ever grown and we believe that it has been due entirely to using it for night pasture that has brought about this change.

We have also obtained good results by using an orchard for a hog yard, but had to remove the hogs a number of times on account of them peeling off too much bark from the trees, hence would not advise giving them the run of an orchard except for a few weeks at a time.

If you have not destroyed all of the dead and diseased fruits on the trees, do not delay this any longer. You cannot afford to carry disease over the winter, or contaminate your orchard next spring. Gather and burn all suspicious specimens.



No Honing

No Stropping

A Product of Brains For Men of Brains

THE keen, quick, business-like directness of the GILLETTE appeals to the man who knows and appreciates a time-saving tool or a clever piece of machinery when he sees it.

With the GILLETTE there's no time wasted in honing, stropping or fussing with a complicated shaving device. You simply pick up the GILLETTE—and *shave.*

And such a shave!

The GILLETTE blade, thin enough to take a perfect temper, yet held absolutely rigid in the handy GILLETTE frame, and adjustable to any beard, shaves as no other razor *can* shave.

The GILLETTE changes shaving from a time-consuming ordeal, to be endured as seldom as decency will permit, to a pleasant three-minute incident in the toilet. It enables a man to always look and feel his best—and yet preserve his face and temper.

Standard Sets $5. Pocket Editions $5. to $6.
Combination Sets $6.50 to $25.

At Hardware, Drug and Jewelry Stores. Look for the big GILLETTE Signs—they show you where to buy.

DAIRYING.

C. W. McDougall, Dairy Inspector, staff Contributor.

Cleanliness in The Dairy.

One prime requisite in making good butter on the farm is a clean sanitary milk from the starting-point. If milk has once become tainted or bad flavored, the effects of it cannot be overcome, however careful one may be in after treatment of the butter.

In order to produce a clean milk it is necessary to have as clean producing conditions as possible.

This does not mean that the cow must be given a bath before milking, but that reasonable cleanlinesss must be maintained. The cow naturally is a clean animal and will keep herself quite clean. But one should see that the milk pails and other tinware are cleaned daily, that the milker is not dirty with his milking and that the stable is as free from dirt, dust and cobwebs as possible.

The most thorough way to clean tinware is to first wash in a liberal amount of lukewarm water containing some good washing soda, using clean, firm rags, then scald all the parts in boiling water and leave them exposed in the sun until ready for use. Care must be taken to wash out all crevices in the tinware, where the bails are fastened to the pails and wherever milk or dirt can find a lodging place.

The milker should keep himself clean, and it is a wise plan to have a regular milking suit which may be hung in the barn from one milking to another. An overjacket and a pair of overalls answer the purpose fairly well.

The stable should be kept as clean as is practicable. A coat of white wash on the ceiling and walls helps wonderfully. Whitewash lightens a stable, makes it sweeter, purer and is a good disinfectant. It can be put on some rainy day and it costs practically nothing. Overhanging cobwebs are not only unsightly, but actual holders of contamination. It is hard to keep the stable entirely free from webs, but a good coat of whitewash will largely solve the difficulty.

All odors should be reduced as much as possible, because milk very readily absorbs these and imparts them to the butter. Good ventilation is essential and the manure-pile ought to be a safe distance from the milking quarters. It is better to haul it direct from the stable to the field where it is to be spread, especially during the summer months when fermentation is more active. The floor should be of concrete or very good under drainage established. Oftentimes when the floor is not very tight, the liquid manure will seep down through the cracks and collect under the floor.

When the cow comes from the pasture she is generally reasonably clean; but in the stable, being held in the stanchion, she cannot keep herself as clean as she does when at liberty, and the milker should try to get her as free from dirt as she would naturally keep herself. In some dairies the practice is made of washing the udders and flanks before each milking and stretching a chain under the cows to prevent their lying down; but this precaution, though desirable, is hardly practical on the farm where no extra fancy price is received for the product. If the milker brushes off the udder and hind quarters very carefully and milks with clean, dry hands it to a clean pail, there is little harmful contamination. The milking should be done quickly, but thoroughly, and the pail held between the knees rather than set on the floor, where the cow is more liable to get her foot in the pail or kick dirt into it.

Ordinary tin milk pails are most generally used in the stable. What are known as the Gurler sanitary milk pails are preferable and as cheap in the end, as they are built stronger and will last longer than the ordinary milk pail. The dail has about the capacity of others, but the top is partly covered, leaving a small circular opening where the milk enters. The cover device holds a strainer consisting of absorbent cotton between sheets of gauze. This keeps all loose dirt out of the milk and is very little more trouble than the ordinary kind. The milk should be strained soon after being drawn and not allowed to set unstrained until time for separating. A desirable way of straining is to use a forty-quart can for storage room and procure a regular strainer for this can, into which the milk for each cow is poured. It needs no further straining before being separated.

Extreme care should be exercised in handling the milk if there is any contagious disease, such as typhoid fever on the farm. The person who milks or takes care of the apparatus should not take care of the sick. If absolutely necessary to combine the nursing and dairy duties, separate clothes should be had for each work and the hands washed in a solution of creolin or other disinfectant.

The pails and tin ware should be sterilized very thoroughly and no chances taken.

With all the improvements of dairy conditions of late years there has been comparatively few dairymen using a strainer top to protect the pail during milking. A strainer that fits and covers the pail will collect a quantity of hair and dust, with other matter that one can hardly tell the origin of, that will surprise the best of us. All the filth thus kept out would scarcely be observed if milking into an open pail.

Hints For The Patron

Where a water tank is used for cooling milk, have a bottom outlet so that the tank can be cleaned of sediment and scalded out with little effort.

When tin milk vessels begin to rust they are no longer fit for dairy use. Discard them for some other purpose and use only the smoothest and the brigtest vessels for the milk.

If the calf seems very hungry, do not feed it all the milk it will drink at one time. Feed often and in very small amounts at first. Neglect of feeding and then overfeeding any young animals are the causes of many disorders of the digestive organs.

When summer calves are old enough to eat, give them dry feeds at first as supplimentary to the milk diet. Shelled corn, oats, clover hay, or fine timothy hay are good. Shelled corn is the best grain that can be fed young calves on skim milk. They may eat grass after they are eight to ten weeks old.

The dairyman loses money every time he breeds a good cow to a scrub bull. Good dairy animals are at a premium. Money spent for the service of a good dairy bull is money well invested.

Cottonseed meal is good for producing cows, but it is not a safe feed for calves and pigs. Feed both cottonseed meal and all other concentrated feeds sparingly till the cows become used to them. They must never be used as a full ration, but always with a large amount of roughage, such as alfalfa, clover or silage.

The dairy stable should be kept clean and well filled with bedding in summer for milking on wet and rainy times. It may be more pleasant to milk outside on nice days in summer, but it is very unpleasant to milk in the mud and rain.

Do not allow shade trees to shut sunlight out of the dairy stable. The sunlight is necessary for purifying the stables, and they will be cool in summer if properly constructed. Let the light in.

Milk will sour more easily in warm than in cold weather. However, as summer comes on there is more sunshine and hence the milk vessels can be sterilized with sunshine. There is no better disinfectant than direct warm sun for killing troublesome dairy germs.—Exchange.

The Dairy Cow.

The dairy cow does more than bring financial success to the dairy farmer. She makes him a better citizen than he would otherwise be. Her influence upon home conditions is a most pleasing contribution to those factors which are responsible for the changed conditions which prevail in the farm homes of today. Thousands of these homes are now characterized by comfort and happiness, where formerly they were blighted by drudgery and unhappiness.

Better financial conditions have contributed to this change, and the dairy cow has been in no small measure responsible. She has contributed in still another way. The dairy cow teaches kindness. Her owner soon learns that only by treating her kindly can he secure the highest possible returns from her, and she responds quickly to the kinds words and proper care. Her disposition is one that the human family might well emulate. She is patient and long-suffering, acquiescing mutely in the arrangements made by her owner for carrying on the dairy business, striving at all times to repay him for every effort made for her care and comfort.

The members of the family, as they come in contact with her and her kindly disposition are influenced for good. As they appreciate the financial benefit to come from caring for her well they take a deeper interest in her. In doing so they unconsciously cultivate those qualities which make them better citizens.

The dairy cow—the prototype of man's best friend—is wielding a greater influence than she is generally credited with. She has always been found in the front ranks in the march of civilization and no agricultural country can prosper long without her. She is a potent factor in the upbuilding of such a country, financially and socially, and a wise people will appreciate her and encourage the industry of which she is the foundation.—The National Dairy Union.

Producing Milk in Winter.

From a report of Mr. James L. Duncan, in the "Journal" of the Department of Agriculture, we learn than an experiment was started in October 1906, in order to ascertain (1) The cost per gallon of producing milk in winter. (2) If winter dairying would pay in the South or Ireland.

For this purpose, five cows were purchased, these having an average yield of 798 gallons of milk containing 3.72 per cent. butterfat. For the first year, the average daily yield per cow was 2.61 gallons containing 3.49 per cent. butterfat—the total yield from October to August amounting to 3,990 gallons.

When in full milk during winter each cow had a daily allowance of 56 lbs. roots; 6 lbs. cake and meal; 12 lbs. hay (this was found to be as much as they would eat); 4 lbs. oat straw. The concentrated food consisted of about—2 parts decorticated cotton cake; 1 part bruised oats; 1 part bran; 1 part dried grains.

As the yield of milk decreased the quantity of meal was gradually reduced to 4 lbs. each per day. In spring the decorticated cotton cake was replaced with bean meal, made from beans grown on the farm. The cotton cake was fed dry. The other concentrated foods were mixed with pulped roots and cut hay, and steamed with boiling water. After calving and up till about the end of April the cows were allowed out for an hour or two on good days for exercise. In the first week in May the cows were turned on to the grass night and day. No cake or meal was allowed afterwards. The only hand feeding supplied after this date was soiling for a short period until there was a full bite of grass.

In calculating the cost of producing milk an important factor is the prices charged for the bulky home

Was Troubled With Liver Complaint For Three Years.

Milburn's Laxa-Liver Pills will regulate the flow of bile to act properly upon the bowels, and will tone, renovate and purify the liver, removing every result of liver trouble from the temporary but disagreeable headache to the severest forms of liver complaint.

Mr. S. Nelson, North Sydney, N.S., writes:—"I have used your Laxa-Liver Pills. I was troubled with liver complaint for three years, and could get no relief. I was persuaded by a friend to try your remedy, and after taking one vial I got relief. After I had taken three more I was cured completely, and I have not been troubled since, thanks to your valuable medicine."

Milburn's Laxa-Liver Pills are 25 cents per vial, or 5 vials for $1.00, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

grown produce. In the following calculations hay is charged at 50s; straw at 30s; roots, including pulping, at 10s; and soiling, (rye and vetches) at 15s per ton. Purchased meal and cake are charged at cost price and home grown meal at what they would have realized if sold in the market.—Irish Farming World.

Study Capacity of Your Cow.

I was talking with a young farmer the other day about his work in the barn, and he said, "I always like to feed my own stock. Maybe it is all a notion, but it seems to me that I get better results when I do the feeding myself. The hired man means to do it all right, but he seems to think they all want to be fed alike. You have got to know your cows.

There is a lot of truth in that. You go into a barn and dump a lot of hay or ensilage into the mangers all in the same amounts, taking no thought as to the different capacity of the members of the herd, and you may be sure there will be large wastes. One cow will leave some in the manger; and have you ever noticed that no cow will ever eat after another, unless she is as hungry as a bear. Each cow should have her own feed and none to spare.

Some cows you can crowd to a point where you cannot others. Try to put them all in the same list and the first you know, you have one or more off their feed and trouble will follow. We must study every cow. A good way to do is to feed a certain amount for a few days, then gradually increase the ration a little. Watch the manger. If everything is cleaned out good after each feeding, all is right. Try a bit more next day. Keep your eye on the manger. Still act accordingly. The minute you find that something is left in the manger, hold on. You have reached the limit. Don't push things any farther for a time. It may do to press a little harder after awhile, but now, wait.

I believe it to be a good thing, too to cut down the ration now and then a day very sharply, so that the cow may come back with a keen appetite. Fasting is a good thing for man and beast. Not to carry it to excess, but far enough to give the digestive organs a little rest occassionally. It will pay well.— E. L. Vincent.

Milking the Animals.

There are many things that a good dairyman will not do, and one of these is to wet the hands before milking. This is unsanitary and should never be done. The udder should be wiped with a clean damp cloth and the hands should be dry. If the teats are rough or cracked, a little vaseline may be used.

It is a common habit with those who do not understand milking, and careless people, to jerk the teats with a quick, violent downward motion, as if they would separate the teat from the udder. This should not be done. The udders of many cows have been injured by such milkers. There are no reasons for this practice. It is only necessary to take the teat in the hand and begin by an easy muscular motion to expell the milk. The first two or three streams should not be drawn in the pail, but should be rejected, as it is likely to be contaminated with filth or undesirable bacteria.

It used to be the custom to take out the poorest land upon the farm—the places that could never be cultivated under any circumstances—for cow pasture. Today the folly of such a policy is apparent and only good land is used.

Work and Worry Saving Wheels and Wagons.

Get a Dominion—utmost strength—least draft—low down for handy loading—buy themselves every year—last a lifetime.

Cost Little—Last Long

Put our wide-tired, take-part, never-wear-out-wheels on all the wagons you now own. Won't clog on muddiest roads. Stand any strain; proof against frost and breakage. Saves you work and horse-power. Priced fair. WRITE US TO-DAY.

LIVE STOCK.

Prejudice Against Show Animals

The prevailing belief among breeders of fine stock is that the show ring tendency is to increase the accumulation of flesh and fat on exhibition animals to the deteriment of the breeding interests of the live stock breeding industry. This gives encouragement that a reform in the show ring etiquette so far as the observance of the properties of animal condition for best breeding advantages is concerned, is approaching approval of public sentiment.

The show animal must necessarily be a typical specimen of the breed it is to represent, the ideal animal, in the mind of the breeder, so to speak, or as closely an approach to this as is possible for the exhibitor to produce. Any system of care and feeding that will in the least degree detract from or injure the breeding possibilities that the animal has inherited, or by nature acquired, is sufficient to condemn its practice as a sin against animal industry and the best interests of the people and country.

That there exists in the minds of many persons who own and handle live stock a prejudice against the show animal no one is at all observing in live stock and live matters will dispute. Why this prejudice exists and how it originated has its foundation just as plainly marked out in show ring history and breeding experience as any other defined principle in live stock business.

The show animal must be not only a fat, sleek, well-kept and well-groomed animal, but it must be an animal possessing to the highest possible degree every quality of excellence that enters into the standard prescribed for the perfect animal of its breed. When this animal is produced in the herd or flock, is it by its natural requirements a show animal or breeding animal? If it possesses the qualities and properties for a successful show animal, what does it possess that would in the least disqualify it from being a desirable breeding animal? In other words, the breeder is striving to produce an ideal animal, that the standard of excellence has described, after years of study and consultation among the most progressive and skilled breeders of the various breeds of stock.

Each breed has its perfect animal defined by a scale of points, and the nearest approach to this is supposed to measure the degree of excellence of the animal in the show ring. The breeder is striving to produce this highest type of animal, the kind that fanciers of the particular breed are studying about, dreaming about, and when they find a near approach to it pay extravagant prices in order to possess it. These animals are breeding animals, because they possess to the highest degree the excellencies of the breed.

The natural law that "like produces like" is not disputed in the animal kingdom, nor by the breeder of intelligence. Certain desirable qualities, marks, breed characteristics, etc., are demanded by the breeder when selecting an animal for use in the herd. The higher the education in qualities of animal the more exacting the buyer is in his demands. The show animal, if a good type of excellence in the breed, always helps in training the eye to the points of value in the animal.

The show animal may not be a good breeding animal; if not, there is a reason apart from that of its simply being a fine show animal. The too common disqualification of the show animal as a breeding animal grows out of the fact that in the fitting of the animal for show there have been unnatural conditions of growth introduced and forced onto it The natural course of a healthy vigorous growth has been lost sight of in the effort to rapidly mature or rapidly fatten, or it has been lost sight of in the effort to flesh up for show. There is the natural growth of the animal that most stock raisers understand, and when they have something extra good that they want to get a good price for they commence with the sucklings, to place them under the most favorable conditions of feed, exercise and care to keep them constantly developing into strong, healthy animals.

The question of forcing the young animal beyond its ability to naturally develop is a matter to be solved and when intelligently disposed of will remove the prejudice against the show ring animal as a breeding animal. The show animal, or the animal possessing the high standard of excellence in his breed or class, fitting him for a competitor in the show ring, has the qualities for a breeding animal. If the breeding powers of this animal are injured by any artificial means used in the feeding and preparation of the animal for show it does not alter the original qualifications of the animal as a breeding animal. It is true the animal as a breeder may have been sacrificed in the effort to make a show animal out of it, but the fact still remains that the material must be selected from the choicest breeding prospects the herds or flocks contain.

The fact that an animal is used as a show animal, that it has been put into show condition and made the rounds of the fairs, does not necessarily make it worthless as a breeding animal. Many of the best sires and dams in the country have to their credit first and sweepstakes prizes taken at fairs and stock shows from all over the country. It is the intelligent feeding and handling of these animals, through their growing period and through the breeding season and show season, that secures to them immunity from show life damage influences.

Will the risk of present-day show ring influences in fitting animals for a practically fat stock exhibition warrant the breeding sacrifice that is annually being made in the ranks of many of the best herds and flocks in the country?—G. W. Hervey, in the Twentieth Century Farmer.

Care of the Ewe.

However important is the care of the ram, the care of the ewe flock is equally important. For while the ram must beget the lambs it is essential that the ewes must be in good condition to nourish them while carried in utero.

Then, too, the condition of the ewe at the time of conception has considerable to do with the size of the lamb crop.

A ewe may be very thin, in which case she may not come in heat, or if she does, she may not conceive. It does not necessarily follow that she does not breed, but it quite often happens.

A ewe in good flesh almost invariably is a good breeder, and a good suckler, something that a thin ewe cannot very well do.

One of the greatest helps to bringing the ewes up to good flesh at the time of breeding, is the practise of flushing the ewes. This is an English custom, as indeed all of our best methods of handling sheep are.

The common method of flushing the ewes is to turn them on some fresh, succulent pasture that has been been saved up for them.

A good way, and one that will appeal to most flockmasters, is to save a piece of second growth hay land for their use.

ILLSLEY & HARVEY CO., Ltd., - Port Williams, N. S.

On our own farm this year, we are running them in the cornfields. At first sight, this may seem to be a hazardous proposition to both sheep and grain, but such is not the case.

We have considerable corn land, so that we are pasturing it only at the rate of one head to the acre. There is very little down corn and the sheep going up and down the rows, picking the tender shoots of weeds that come up despite the best of cultivation, eating off the lower blades of corn and doing much good to the corn itself, regardless of the benefit to the sheep.

As a preventive to them eating the grain, though they never have acquired the habit, we feed a small amount of oats at the barns every morning and night. Our object in feeding grain is two-fold. To keep them in good flesh and to get them to come to the barns morning and night, for the inspection of the ram.

An acre of rape too, is very good. Sowseven or eight pounds per acre and allow to grow until it is eight or ten inches high, it should afford grazing for 40 or 50 ewes for three or four weeks, the best part of the breeding season, especially if it is supplemented by a bit of oats twice daily.

Soiling, or partial soiling, has been very successful with us. If it is convenient to have a corn field on one side of the sheep pasture, or so that the cut corn can be carried to feed bunks in the lots, it is very easily done, takes little time, and is very cheap, as an acre of corn will, when fed this way, furnish an immense amount of feed.

I have now told you how to handle your ewes during this period, but failed to tell just why it should be done. The reason is this:

A ewe that is in good flesh, or that is gaining in condition each day, is bound to be in good health and bursting with rich, red blood. In this condition she most readily conceives to the service of the ram and, in the opinion of most, the percentage of twins is larger.

Looked at in a logical light, no man can afford not to give his ewes care at this season of the year. A little extra care now will afford great returns later in the season.

We all know that the thin, half-fed horse cannot work like a big, strong well fed one. The same applies to sheep. The production of lambs is as much a ewe's work, as is drawing the plow that of the horse's.

A poor, half-fed ewe cannot do her work any more than can a thin, emaciated horse. — North Dakota Farmer.

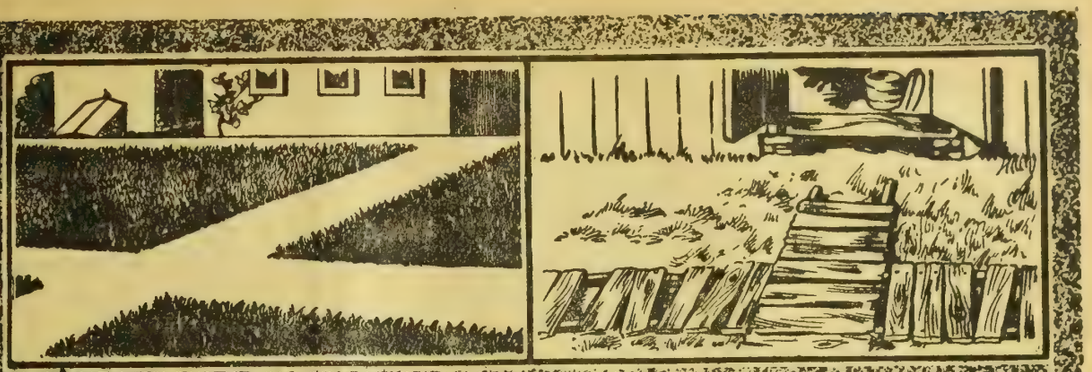
Lice Powder.

One of our good friends writes us: "If your readers wish for an inexpensive, quickly prepared, absolutely effective lice powder, it is made by sifting coal or wood ashes through a fine flour sieve, and just dampening them with kerosene. Mix the oil thoroughly with the ashes. As the oil evaporates quickly, it is best to prepare the powder freshly each time it is to be used. The ashes alone are valueless; the oil is the effective agent."

Stock Note.

We know of nothing more palatable to hogs than rape. Once they get a taste of it they never forget the place where they found it, and will return to it twelve months afterwards.

Hog tight fences are rather expensive in the first place, but the best are cheapest in the long run. A bunch of hogs will soon destroy a wooden fence.



Concrete Sidewalks are Safe, Sightly and Everlasting

LUMBER used in damp places and on wet ground—as, for instance, in walks—has a very short life. It requires almost constant repairing and, in a few years, needs replacing.

Concrete, on the other hand, improves with age, and the very dampness which destroys lumber calls out the best qualities of the cement by making it harder and harder—until neither time nor traffic can affect it.

The best of wooden walks keep getting out of repair, and are a continual menace to life and limb. They are also a frequent source of expensive doctor bills and lost time. Then again, they are likely to eat up the original cost in repairs before they are replaced.

Concrete walks are sightly, everlasting and safe. They cost less to build and need no repairing nor painting.

Write for our *free* book, *"What the Farmer Can Do With Concrete."*

It tells in plain, simple language, how you can save money on farm construction by using cement for Barns, Dairies, Foundations, Fence Posts, Troughs, Feeding Floors, Hitching Posts, Stalls, Silos, Stairs, and so forth. The Book is well illustrated with photographs, plans and diagrams. Fill out the coupon or send a postal *to-day.*

THE HORSE.

Training Young Horses.

There are two things which the young horse should never know. The first is that there is a halter in the world which he can break, and the first time the youngster is tied up an unbreakable halter must be used. It is doubtful if there is a worse habit formed by young horses than pulling or halter breaking, or a habit which is harder to remedy. Many horses once forming this habit can never be cured of it. The proper time to begin halter breaking is when the foal is a few days old, and only a good strong halter should be used. If the youngster succeeds in breaking the halter even a time or two when first haltered, the habit will be formed and may last a lifetime. The breaking of halters and bridles soon becomes expensive. The halter-breaking horse can never be left tied while hitched to a rig, and when not hitched to a rig the owner never knows where he is to find the animal. By using a strong halter, one that cannot be broken, no horse need ever form this very disagreeable habit.

The second thing which the young horse should never know is that there is a load in the world which he cannot pull. Balkers are made, not born, and overloading at first is almost sure to make a balker of a horse. This habit, like halter breaking, is hard to remedy, and every one owning a balky horse knows the disadvantages connected with it. Too much care cannot be taken to never overload a young horse. Never load at first heavier than the horse with which the youngster is hitched can pull, and this horse should always be a reliable puller. Young horses, I think, should be broken double before being hitched singly. After a horse is thoroughly broken double there is seldom any trouble to break him to drive singly. All young horses should be broken to drive single, as this is a market requirement.

To let the young horse know what is wanted of him is absolutely necessary. When this is once known the youngster will usually fulfill the requirements. After the young horse is thoroughly halter broken the harness should be put upon him and he should be led and driven around four or six times a day for two or three days before being hitched, with a good, level-headed, fast-walking horse, one that can start quickly and go fast if necessary.

Do not hitch the young horse to a high-priced rig the first time. He may break it up for you. There is nothing better and no better time than a sled in winter when there is snow on the ground. Driving through a six-inch snow soon takes the wire-edge off and in case the youngster should throw himself he is not likely to get bruised or scarred. The farmer also has more time at this season of the year than any other to train his young horses properly. Nothing but good, strong harness should be used. None other will do. Always have a good whip; hitch up quickly and go ahead. Do not stop for trifles. If the youngster kicks, go ahead. Let him kick until he is tired and quits, and that will end the kicking. Hitch him at least twice a day until broken. Once a month will not do at all. With kindness, firmness and level-headedness there is no reason why a young horse should not be fairly well broken in a month's time, and everybody knows the advantage of a well-broken horse. It is a pity that so many good horses are spoiled in the training—Charles McIntire.

The Way to Handle the Stallion.

Every spring the editors of farm papers are flooded with inquiries from stallion owners regarding the proper method of handling their stallion to get him in shape for the season's work. If the proper care and attention were given to the stallions during the next four or five months there would be little occasion for these inquiries next spring.

By far the largest number of stallion troubles, and even deaths, may be traced to digestive disorders. There are a variety of causes which lead to these disorders, but lack of exercise and improper feeding stand out as the chief ones.

Horses are so constituted that they naturally require more exercise than any other class of farm animals. No one would advise turning a stallion out to rustle for himself after a season's work, yet this would be more in harmony with his nature than confining him in a small stall without exercise for three or four months

The writer has always worked the stallions under his care. In most cases, especially with home-bred animals, they were made a part of the regular work teams on the farm. It is not always safe to put two stallions in the same team, although they may be broken to work together if handled properly. The writer has worked two stallions in a four-horse team, using them on the outside, and experienced little difficulty in handling them. There seems to be little difference whether geldings or mares are used as teammates, providing the mares are in foal.

The stallion should not be required to do such heavy work that he will lose flesh. This may be obviated by changing off horses when the work is heavy.

Imported horses, as a rule, are not so easily handled in this manner. The most of them are not used to being made a part of a team, if worked at all. It is best to break them single first.

A case comes to mind in which a 3-year-old Clydesdale was purchased to head the stud. The first season he was allowed but a dozen mares. He was broken and given the same amount of work that the fillies were. He is now 6 years old and has been given light work after each season in the stud. He has been exceptionally successful as a sire where other stallions in the neighborhood have given only fair results.

Whether at work or not the stallion should receive some grain during the year. One pound of grain and one pound of hay to each 100 pounds of the stallion's weight is a fair guide. This must be varied to meet the needs of the animal as shown by his condition. A set of scales are handy in this connection for it is hard for even an experienced horseman to tell whether a ton-horse has gained or lost fifty pounds in a month.

Four quarts of oats, two quarts of bran and three ears of clean, sound corn three times a day make a good ration for a stallion whether at work or on the stand.

A sudden change of feed or the use of drugs should not be attempted except upon the advice of a veterinarian.—Wm. Buckland.

Chamberlain's Cough Remedy never disappoints those who use it for obstinate coughs, colds and irritations of the throat and lungs. It stands unrivalled as a remedy for all throat and lung diseases. Sold by all dealers.

Make Them Sound

A lame horse is a dead loss. Spavin, Curb, Splint, Ringbone, Swollen Joints and Bony Growths won't cure themselves. Yet you can cure these troubles and make your lame horse sound with

Kendall's Spavin Cure

just as thousands have done, and are doing today.

In the 40 years that this world's famous remedy has been on the market, Kendall's Spavin Cure has saved millions of dollars to horse owners.

Mounds, P.O., Olds, Alta.

"I have used Kendall's Spavin Cure for a number of years with great success, and I think it can't be beaten as an all-around stable liniment for Kicks, Strains, Swelling of all kinds, Ringbone and Spavin".

ARTHUR FLETCHER.

DR. J. WOODBURY'S HORSE LINIMENT

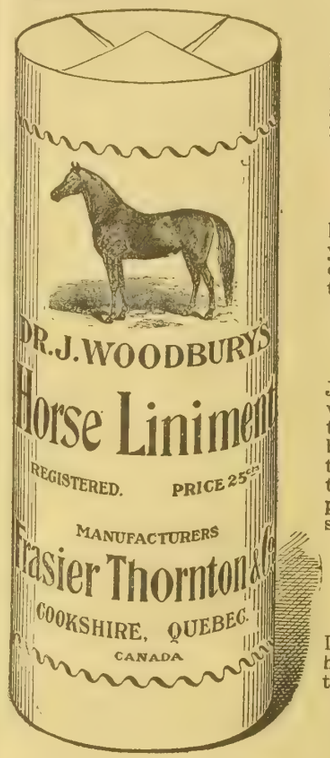
INFALLIBLY THE REMEDY

For the removal of Splints, Bog Spavins, Enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough, Enlargements of the Glands, Affections of the Kidneys. For Distemper, Strangles and Colic it is infallibly the remedy.

All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the fore feet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured.

Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions.

Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.



Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it. Yours truly,
CLARKE BROS.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr. J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use. Yours truly,
C. C. McLEAN.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung diseases. It is the best thing to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities, which may exist, and gives the system healthy action.
NEWTON LEE,
Owner "All Right," 5817.

Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen Dr. J. Woodbury's Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take.
Yours truly,
ELMSDALE MERCANTILE CO.,
Elmsdale, N. S.

Dear Sirs:—I cured my horse with Dr. J. Woodbury's Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse.
Yours truly, H. R. WHITEHEAD.

Dear Sirs:—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months' standing. In my large experience with horses, I consider this liniment to be the best made for all diseases in the horse, and I recommend it to my friends. E. J. ANDERSON, Truro, N.S.

POULTRY.

Maritime Poultry Men in Annual Convention.

The annual meeting of the Maritime Poultry Association was held in the Board Room, Maritime Winter Fair Building, Amherst, N. S., on December 6th, at 10 o'clock, a. m.

J. P. Landry, President of the association occupied the chair. About thirty enthusiastic poultrymen attended the meeting.

The minutes of the last annual meeting were read and approved.

The treasurer's report showed expenditures, during the year, of $18.60, leaving a balance of $76.45.

President Landry, in his address, referred to the improvements that had been made in the poultry department of the fair during the year and expressed his satisfaction for the success the Maritime poultrymen were accomplishing as was evidenced by the good showing they had made at all the fall shows and at the Winter Fair. He outlined the progress that had been attending the Amherst Poultry Show during the past nine years and from what he knew of the abilities of the class of people who take an interest in the Winter Fair poultry classes he could safely predict a steady improvement in years to come.

The dressed poultry classes, in other years had not been satisfactorily filled but he was glad 1910 brought a decided improvement. Maritime poultrymen should keep up the standard of excellence in this class so that outsiders would come here to buy.

He was trying to plan a satisfactory system for putting the entry tags on the various coops, one that would simplify the work and prove agreeable to all concerned. He had a system in mind that he expected to complete and put into operation at the 1911 show.

He read the following statement of the expenses incurred by the Maritime Stock Breeders' Association in connection with the 1909 poultry department of the Winter Fair:

Live Poultry Prizes	$315.95
Utility Breeding Pens	36.75
Live Utility Pairs	48.75
Turkeys and Geese	82.25
Ducks	13.25
Dressed Poultry	87.50
Live Poultry Specials	25.00
Pigeons	4.75
Plucking Competition	14.00
Judges	75.00
J P. Landry, ribbons, etc.	41.87
Embree & Trenholm, feed	27.33
Labor, supplies, etc	73.58
New Coops, 1909	140.88
New Coops, 1910	116.00
	$1102.86

He thanked the poultrymen for their hearty co-operation and the poultrymen's friends for financial assistance given in the form of donations for special prizes.

Vice President for Nova Scotia, I. C. Craig, and Vice President for New Brunswick, Percy Gunn, were both pleased with the march of progress which the poultrymen were making. Vice-President for Prince Edward Island, L. H. D. Foster, gave an outline of what Prince Edward Island poultry men are doing. They were well represented at the fair and as other lines of live stock from the Island province were leading in their respective classes he predicted similar successes in the near future for their feathered stock.

A Prince Edward Island Poultry Association has been formed—they now have two poultry associations, and he hoped to see a third organized before long—as there had been some agitation for a branch of the Poultry Producers Association.

Messrs. Seth Jones, Wm. Robinson and Geo. Thompson, members of the Prize List Committee, reported satisfactory progress and were well satisfied with the courtesy extended to them by the Executive of the Stock Breeders' Association.

A letter from the Canadian Rhode Island Red Club, offering ribbons for competition at the fair was read and after afew remarks by Mr. W. H. Henry, who would like to have Rhode Island Red breeders become members of the Red Club, a resolution moved by Dr. Webster, and seconded by Mr. Seth Jones, expressing the Association's appreciation of the Rhode Island Red Club's offer.

The association also unanimously passed a resolution, moved by Mr. Seth Jones, and seconded by Mr. I. C. Craig, thanking the Prince Edward Island Poultry Association for their generous donation of twenty-five dollars, offered for special prizes for competition by any persons who are bona fide members of the P. E. I. Poultry Association.

Mr. L. A. Haszard was pleased at the way Maritime Poultry matters were progressing and stated that the prime motive which induced the Island Association to offer the $25.00 special prizes, was for the purpose of increasing their membership and thus getting encouragement from abroad.

The following resolution recently passed by the Prince Edward Island Poultry Association was brought before the Maritime Association for consideration:

"Whereas, the present rules governing the Poultry Department of the Amherst Winter Fair necessitate birds enetered from the Eastern Section of P. E. Island, leaving Charlottetown on Friday morning, thus spending three extra days in Amherst.

"Therefore Resolved, that the Association strongly request the Maritime Poultry Association to arrange that in future, birds coming through Charlottetown, be admitted to the Exhibition building, up to 10 o'clock on Tuesday of the week of the exhibition."

GEO. LIGHTIZER.
Secretary.

After quite a discussion by Messrs. Haszard, Foster, Craig, Jones, Gunn Hurst and Landry the Island resotion was adopted.

Mr. Seth Jones moved and Mr. Tucker seconded the following resolution which was unanimously carried:

"Whereas, there is no law on the Canadian Statute Books making it a criminal offence to offer for sale or sell rotten, decomposed, tainted or otherwise bad eggs which are unfit for food.

2. "Whereas the consumers, merchants and producers suffer great inconvenience as well as financial loss from this cause,

3. "And whereas, under the present system of marketing eggs the same price must be paid for everything contained in a shell and called an egg, unscrupulous producers, egg gatherers and dealers are tempted to offer for sale and sell, eggs which are rotten, decomposed and unfit for food, receivers being compelled to accept and pay for them, having no redress under present laws.

4. "And Whereas the marketing of such rotten, decomposed, tainted and bad eggs is a menace to the public health, an impediment to trade and an unnecessary source of tremendous loss to all concerned in the handling of them, more especially to the producer, owing to the very much lower prices that dealers pay to the farmers in an endeavor to protect themselves against this loss.

5. "And whereas it is both expedient and necessary that legislation similar to what other countries have enacted shall become effective in Canada in order to save those interested from inconvenience and financial loss, also to protect the public health and in addition to increase the profitableness of the industry.

"Therefore, be it resolved, that we, the producers here assembled, petition the Government to enact such legislation as is necessary in regard to this question, and to pass a law prohibiting the sale of eggs that are rotten, decomposed, tainted and otherwise unfit for food, and further that a copy of this resolution be sent to the Honorable Minister of Agriculture, also to our representative Members of Parliament, urging them to use their good offices to further legislation along these lines."

Dr. Webster moved a resolution which was unanimously carried, that Rule 82 governing poultry entries be changed so that two males or two females or a male and female may be entered for the fee of 25 cents. At present the rule calls for an entry fee of 25 cents per pair, male and female.

Mr. Haszard brought to the attention of the Prize list Committee the rule governing the distribution of prizes in cases where the number of entries exceeded five, ten or fifteen. When the entries do not exceed five the present amount distributed is $2.50. When there are more than ten entries an additional sum of seventy cents is paid and when the entries exceed fifteen in number an extra sum of $5.00 over and above the amount paid for the first five is distributed. Mr. Haszard suggested that the rule of distribution be changed so that for every additional five birds entered an extra sum of $2.50 be awarded.

Messrs. Craig and Jones made a recommendation that the matter of mating birds for the utility pens be left to the discretion of the breeders as to whether they should use a pen of old birds, a pen of pullets or any mating they saw fit as in any event the educational feature which the pens were supposed to show would be carried out.

Mr. Percie Johnson, of Newfoundland, was present and after expressing his gratitude for the kindly manner in which he had been treated by the poultrymen and all concerned, he offered the association a Cup, to be competed for at the 1911 show. He had gleaned many useful pointers from the various poultry men whom he had come in contact. Poultry interests were increasing in Newfoundland and he hoped that in the near future a live poultry association would be organized at St. John's.

Dr. Webster suggested that prizes be offered for pet stock as well as poultry.

Mr. Landry explained that the act governing the M. S. B. A. did not allow of further extensions along the line suggested by Mr. Webster.

The Election of Officers resulted as follows:

President—Jos. P. Landry, Truro, N. S.

Vice-Presidents— Dr. C. O. Webster, Pictou, N. S.; Percy Gunn, Sussex, N. B.; L. A. Haszard, Charlottetown, P. E. I.

Directors—I. C. Craig, Amherst, N. S.; W. H. Henry, Shubenacadie, N. S.; Mr. Hurst, Hartland, N. B.; Walter McMonagle, Sussex, N. B.; John Burke, Charlottetown, P. E. I.; Oris Gill, Little York, P. E. I.

Prize List Committee—Seth Jones, Sussex, N. B.; L. D. H. Foster, of Marshfield, P. E. I.; Wm. Robinson, Amherst.

Secretary-treasurer—M. A. McLeod, Sussex, N. B.

Poultry Meetings at The Fair

A new feature at the Amherst Winter Fair was a series of poultry meetings. They were held Tuesday and Wednesday evenings at 8 o'clock in the Board room, Winter Fair Building. These meetings were well attended by earnest and enthusiastic poultrymen and ladies of the Maritime Provinces. The meetings proved to be very interesting and instructive, and plans are being considered to have a more extensive program next year. This is a move in the right direction as it gives the poultry exhibitors a chance to get advice from the best talent and experts that attend the fair.

The program was pronounced a grand success.

The meeting held Tuesday evening, Dec. 6th, was presided over by Mr. I. C. Craig, who spoke of the advance in interest in poultry in the provinces by the sea. He introduced Prof. F. C. Elford, of McDonald College, who gave a very interesting and instructive address on "Marketing Poultry Products," which was followed by a general discussion.

Mr. A. C. Smith, Waltham, Mass., gave a demonstration on mating Barred P. Rocks. Mr. Smith is a past master at this mysterious art and was closely followed.

Mr. Seth Jones was next on the program with an address on "The Feeding and Care of Poultry." A general discussion followed on this interesting subject.

On Wednesday, December 7th, the poultry meeting was presided over by the president of the association, Prof. J. P. Landry. Prof. Elford gave a strong address on "The Production of Winter Eggs." Mr. A. C. Smith followed with instructions on "How to Prepare Fowls for Exhibition." This was a subject that all men were keen to hear.

Mr. Arthur Jones, Montreal, export manager of Guner, Longlor's & Co., gave a most interesting and forceable address on "The Dealers' Difficulties in the Egg and Poultry Business."

Mr. Seth Jones opened the discussion by speaking on the advantage of marketing high quality eggs and chickens, giving a description of the careless system that prevails at present in this country in regard to handling eggs and in marketing thin scrubby chickens, instead of milk feathered and finished chicken and the difference in the old and new way of dressing poultry for market.

At the business meeting of the Poultry Association a strong resolution was passed petitioning the Government to make it an offence to sell rotten eggs. It passed unanimously.

THERE ARE FEW PEOPLE

Who Have Never Experienced A HEADACHE.

Headaches effect all ages and both sexes alike, but the female sex is naturally the more effected through the higher nervous development and more delicate organization of the system.

Burdock Blood Bitters has, for years, been curing all kinds of headaches, and if you will only give it a trial we feel sure it will do for you what it has done for thousands of others during the past thirty-five years.

Mrs. C. Meadows, Clarksburg, Ont., writes:—"For years I was troubled with sick headache and dizziness, and was also constipated. I was advised to try Burdock Blood Bitters. I only took three bottles of the medicine; now I feel like a new woman. I find I am completely cured, and I can truthfully testify that it is the best medicine I have ever used.

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

The Tour of a Smile.

My Papa smiled this morning when
He came downstairs, you see,
At Mamma, and when he smiled, then
She turned and smiled at me;
And when she smiled at me I went
And smiled at Mary Ann
Out in the kitchen, and she lent
It to the hired man.

So then he smiled at someone who
He saw when going by,
Who also smiled and ere he knew
Had twinkles in his eye;
So he went to his office then
And smiled right at his clerk,
Who put some more ink on his pen
And smiled back from his work.

So when his clerk went home he smiled,
Right at his wife, and she
Smiled over at their little child
As happy as could be;
And then their little child, she took
The smile to school, and when
She smiled at Teacher from her book
Teacher smiled back again.

And then the teacher passed on one
To little James McBride,
Who couldn't get his lessons done
No matter how he tried;
And Jamesy took it home and told
How Teacher smiled at him
When he was tired, and didn't scold,
But said, "Don't worry, Jim!"

And when I happened to be there
That very night to play
His mother had a smile to spare
Which came across my way;
And then I took it after 'while
Back home, and Mamma said:
"Here is that very self-same smile
Come back to us to bed!"

A Thought for the New Year. "Let each of us every morning start a smile on its civilizing tour."

The Quarrel.

By Kate Gordon.

I'm quite sure of one thing," she said, with a cooing accusation, her head turned slightly from him, "and that is—" "That I love you so terribly that it frightens me?" He lifted the brown hand that had been playing with the pine needles and gently kissed its every finger. "Is that what you are so sure of Betty?" This as he laid the fragrant palm against his cheek. "Well, you're right dear, if that's it," he said, with a long sigh of peace.

They were in the wonderful, soul-stirring silence of the Adirondack woods. The gold of the evening sky glittered above the pronged trees Oars and boat cushions that had been carried were lying in a heap near them. She was sitting on the ground against a fallen pine. His head was resting on her knees. Other people did not matter to them. The discovery of new genius were all wars of nations, political strife, the trifles. The world was a ball to be spun to their liking. For they were young and in love, in the exalted yet besotted way that defies that one fact and cheapens all others.

"But that is not what I meant, Bob." An excited breath broke on the words.

"Then it must be this—that you're an angel and in marrying you I'll be rewarded far beyond my earthly deserts." He smiled up at her securely awaiting a warm contradiction.

Instead, she began running a finger lightly across the line of sun-brown that slashed his brow. "That's some thing like it. Yes, I think that expresses it exactly."

He laughed and rose to his elbow. "You vain, cheeky thing." But she looked at him so accusingly that he grew serious. "What's up? What have I done?"

"It's what you haven't done, Robert."

"Robert?" he echoed. This gets tragic. What haven't I done, Elizabeth Ann."

"Don't" she said and frowned.

"Well you look it as you sit there" he teased. "Yes, as you put your head up that way and shut your mouth, you're the living image—for the first time—of your awful, full name."

"It's all very well to take it so lightly," she said, her gaze sad and searching; "but I'm not keeping things from you. I haven't had a past, and secrets."

"Thank God, no," he said, his eyes warm, as he tried to take her hand again.

"But you—you have," and the hand he wanted was shot behind her back.

"The thing I'm sure of is this—you have not told me everything."

He remained silent for a moment. "I don't quite understand you, dear. What sort of things do you want me to tell you ?"

He saw she was very much in earnest. Her face set under the light coat of tan, her eyes clouded, the breath strained in her long full throat that rose above the boyish collar of her serge blouse.

"You'll remember the day after I said I'd marry you?" Her dignity bent a little and her voice melted at the memory.

"The day after? Not as well as I remember the day," he said, a little reproach in the tone.

"You told me some things about yourself that day," she went on hastily, "some mistakes in the past that you were sorry for, some foolish things of all sorts—scrapes at college, and all that. I believed that you had told me everything that mattered. I trusted you. I forgave you whatever you had done that was foolish. But—" the girlish tone grew surprisingly hard— "there are things shut in your heart that I know nothing of."

He stared at her puzzled, and then laughed softly, as at a memory. He did not see her wince at the laugh.

"That's just what my dad said," he nodded.

"And what was the amusing thing your father said?"

"He treated me to some observations on the sex to which you belong Betty. 'My boy', he said, ' a woman is the most inquisitive of all living things. Eve began it, and every mother's daughter since takes after her. They have an intense curiosity about every slightest thing that in the remotest way touches the man they love. They are particularly keen about his past. The lady novelists are responsible for this—lady novelists believe that all men are walking sepulchres of dead sins," said dad. 'You, my boy, will be questioned about the past. You're only twenty-six and you haven't done anything very wicked, but you won't be believed. In fact,' said dad, 'I'm not sure that you'll be really popular unless you pretend to have some grave faults from which marriage reclaims you as a brand from the burning, because a woman, my boy' said dad, 'would rather feel that she had had a hand in reforming a man by marrying him, than marry a Sir Galahead ready-made, who gave her none of the credit—"

But Betty sprang up and brushed past him, leaving him sitting astonished among the pine needles, staring at her.

"Don't tell me any more," she said, her voice shaking. "Your father's cynicisms are nothing to me."

He swung himself up by his wrists and faced her.

"Betty, what's the matter with you? You've been thinking of something all day." He laid his hands on her shoulders but she brushed them away.

"Your father was mocking me."

"Nonsense. That's just the funny way that dad runs on—dear old dad'

"Yes, runs on—in his club window."

"Why shouldn't he?" His eyes gave back a flash like that in her own. "What's the matter with his club window? He's an old man—sixty-two. He's done with Wall Street, after thirty years there that have left me rich enough to give you to the full what your father has always given you. Why shouldn't he sit in his club, pray?"

"Laughing at holy things?" the girl demanded.

"He doesn't. A woman's foolish fancies are not holy things. A woman's suspicion is not a holy thing. Her offensive curiosity is not a holy thing."

...

"Offensive?" she faltered. "Can any interest I take in you be offensive?"

"Yes," he said flatly. "If I had secrets that made my marriage to you wrong—secrets that could hurt you or anyone else—I'd be no better than a swindler who gets what he wants by appearing what he is not. Nevertheless you keep doubting me. And as you have started this I'll tell you now that you have done something even worse—you have tried to make me betray other people to you."

"You are talking in riddles," she said icily. "I wish you'd explain."

"Didn't you try to make me tell you about why Harry Porter left college, why his engagement was smashed, why he bolted to the Klondike? Didn't you try to make me tell you all about my cousin Effie—that foolish boy and girl love affair of five years ago, and why our engagement lasted a month? You know you did. But did I put you on this sort of gridiron about Ted Black, that everyone thought you'd marry?—about Count Feydeau, who followed you from Paris? You know I didn't. I asked you if you loved me. You did. That was all that interested me. You see, Betty," he said, his voice very earnest" there are things that should be sacred to each of us. Because I love you shall I cease being a distinct creature, a man who can keep his faith with a friend? Now you know what I mean by offensive curiosity. Men hate it. They not only hate it, they fear it."

Bob's eyes had an usual look. The boyishness was replaced by a grave mature questioning, as if they gazed past Betty into the long, long years where they were to walk together.

"I hope," he said, after a heavy pause, "you're not going to be one of those wives who open their husband's letters quite as if they were their own."

Betty's face grew hot. "The wish implies a doubt that is scarcely flattering."

"I've heard from older men that some wives are like that."

"Doubtless they permit their husbands a like privilege, at any rate," she said, her lips curling.

"A man wouldn't want the privilege, nor enjoy it."

"Wouldn't care enough, perhaps."

"Would care too much, and trust too much. Besides, I believe—" and an unthinking little chuckle broke from him—"yes, by jove, I do—that the most important thing women get out of this is a feline sort of enjoyment in reading something not meant for them."

"She gave him a long, bewildered, scorching look, and catching up her sailor hat from the fallen tree, went from him so rapidly her skirts made a flurry of undulations about her feet. He left the oars and the boat cushions and was after her at a light swinging run down the glade of the woods where the lemon-colored glit-

Consumption Book FREE

This valuable medical book tells in plain, simple language how Consumption can be cured in your own home. If you know of any one suffering from Consumption, Catarrh, Bronchitis, Asthma or any throat or lung trouble, or are yourself afflicted, this book will help you to a cure. Even if you are in the advanced stage of the disease and feel there is no hope, this book will show you how others have cured themselves after all remedies they had tried failed, and they believed their case hopeless.

Write at once to the Yonkerman Consumption Remedy Co., 1641 Rose Street, Kalamazoo, Mich., and they will send you from their Canadian Depot the book and a generous supply of the New Treatment, absolutely free, for they want every sufferer to have this wonderful cure before it is too late. Don't wait — write today. It may mean the saving of your life.

Blending coffee

is a fine operation requiring highly developed skill. The secret of that unusual richness and briskness in Estabrooks' Coffee is in the perfect blending of strength and flavor. It is a coffee for particular folk.

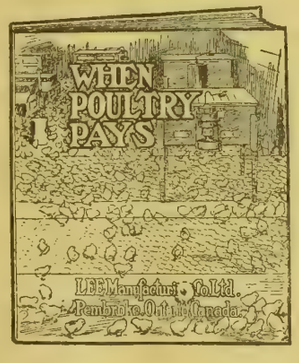
LET THE PEERLESS WAY SHOW YOU HOW TO MAKE A SUCCESS OF POULTRY RAISING IN CANADA

THE PEERLESS WAY of co-operative raising and marketing of poultry will absolutely guarantee success to every poultryman who will carry it out complete. Whether you have never kept poultry—whether you have kept poultry and made a failure of it—whether you have kept poultry merely in a haphazard way—or whether you are now doing well but might do better—The Peerless Way can help you to greater profits. For The Peerless Way shows how to hatch—feed—care for—fatten and kill and HOW TO MARKET.

Send right away for a full description of this money-making method. Let us explain to you just exactly **why** The Peerless Way will get you more profits, and let us send you our big, plain-spoken, Free Book containing

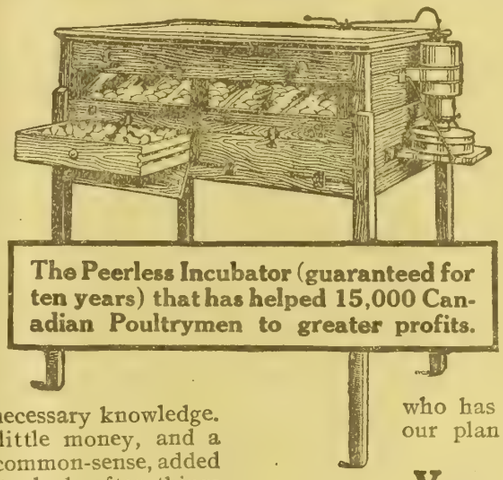
Some Facts, Their Proofs and an Interesting Offer

that will enable you to put The Peerless Way to work for yourself at a cost so low as to be scarcely worth considering. This book is very frank; it tells you just what you can do, and what you cannot do, and, if you have any leaning whatever towards poultrying as either a business or a side-line, you will be interested in the straightforward way it comes out with information that is vital to your success.



It Will Cost You Little to Adopt the Peerless Way

You don't need a great lot of cash to make the right kind of a start in poultrying; the knowledge of what to do and what not to do is far more essential. But you do not need to be an expert; for we are ready to supply you with all the necessary knowledge. If you have just a little money, and a pretty fair amount of common-sense, added to enough diligence to look after things properly, The Peerless Way can make poultry profitable for you.



The Peerless Incubator (guaranteed for ten years) that has helped 15,000 Canadian Poultrymen to greater profits.

Co-Operation In Raising and Marketing

The Peerless Way is a great deal more than merely a system of poultry-raising; it is also a practical method of co-operative marketing,—a system that will make you independent of combines, and enable you to obtain top-notch prices for large or small quantities of eggs and poultry by showing you how to market to the very best advantage.

The Peerless Way Has Over 15,000 Successful Users

Over fifteen thousand poultrymen in Canada have made a success of poultry raising by The Peerless Way. They have made no heavy investments—they have started with no elaborate equipment—nor have they given up a big tract of land to their poultry yards. They have simply done what you, or any other capable person, can do—adopted our system, followed the plain practical method it teaches, and used freely the advice of our experts. Most of them, without knowledge or experience, have stepped into the business that guarantees high dividends on a small investment. Some of them are devoting only part of their time to it, and a few of them are devoting all their time to it—though mighty few of them gave it all their time on the start. But every man who has consistently followed our plan has achieved success.

You Can Have Free Advice From Our Poultry Advisory Board

If you are a user of The Peerless Way, you are entitled to consult our poultry experts at any time without charge. The Peerless Way covers everything in poultry-raising that it is possible for any method to cover; but if, at any time, a point comes up that is peculiar to you alone, all you have to do is to write us. Our experts will consider your case individually and write you personally. This service is free to every member of the Peerless Family.

We Will Show You How To Market Your Poultry And Eggs.

The Co-Operative Marketing plan, that forms so important a part of The Peerless Way, has helped our 15,000 co-workers to make more money than any one of them could have made, working individually. The poultry market is a real market—if you know how to take advantage of it. We are constantly over-run with orders for both eggs and poultry. As a matter of fact, poultrying as a business is a long way from being over-done in Canada—there is plenty of room to make good money out of it. Be sure to send for our book.

ter poured as if from electrified metal.

"Betty". He reached and flung one bared, coercing arm about her "Darling."

"Don't," she said, wheeling on him. Her face being pale was gastly in the unearthly radiance. "You despise women, you have betrayed yourself. And I thought you—but no matter what I thought. Your father's cynicism has not been wasted on you. You happen to have a fancy for me—that's what you call it in your heart, no doubt—but I'm nevertheless a woman—that poor, contemptible thing. According to your code, and the code of most men, I begin to believe a woman can be laughed at and lied to—"

"There!" The word was like an imperative touch and stayed her. Bob's face was cold. "Don't say any more by way of description of me, if you please. I'd like some facts instead. When was I proven a liar?"

"Deception is a lie without speech." The miserable words had a triumph of a sort in them. "You'll have the truth. Yesterday afternoon when you were wrestling with Allan, a locket fell out of your pocket" She watched him closely. "I saw what you did—heard what you said. You thought I'd gone into the tent—I hadn't—I'd gone just behind the tree to get some twigs for the fire. I saw the locket fall open. There was a picture in it. Allan tried to snatch it up—you got it first—you kissed it and showed it to Allan, and you laughed as if you'd done something clever. He asked you who it was—you whispered something—they you laughed again and said, 'Not a word to Betty, old man'."

As her words rushed out, he grew intent, quiet. When she flung the last phrase at him with all the contempt of which her voice was capable, his gaze sank from hers to the ground. She waited until his silence became an answer. It was the only answer he could make, she told herself.

"Have you anything to say?"

He smiled a little wanly. "Your instinct was to doubt me at once?"

"Your own words to Allan—" she began, but he continued as if he had not heard.

"Your instinct was to doubt me at once," he said conclusively. "You didn't think the picture might be yours?"

"How could I? Alan said 'Who is it?' Even the big old-fashioned locket," she said bitterly, "I'd never seen before." H

"You didn't think it might be my mother's or my sister's; you didn't try in some way to reconcile what you saw with your knowledge of me," he said in musing tone.

"Would I care if you kissed your mother or your sister? You told Allan to say nothing to me. Those words have haunted me, and your laugh. "Oh" she said with a burst of pain, "that's how men keep pact to cheat women—with a laugh and a wink."

"That's all, then," he said briskly, and yet with apathy. Let's get back to the camp. It's later than we thought. There, they're calling us."

He gave an answering "Hallo" and started rapidly towards the right. There was nothing to do but follow him. It was a flat denouement to the tragedy in her heart. He had denied nothing—had only sought by a trick to place her in the wrong. She was so angry, so dismayed, she grew cold and weak. She did not try to keep beside him. He did not turn his head.

As they neared the white camps and the blazing fire of boughs she

weakened. She loved him so much. If he would only speak—only prove her really wrong, how glad she would be.

"Bob," she called faintly.

He turned to her and she saw his face serious and calm He seemed older—a stranger in a sense. Her own gaze struggled to be still obstinately proud.

"Bob, if you said what you did to Allan to tease me because you knew I'd overhear—"

"I didn't,, he said gently.

"Well, if I made a mistake in the words—"

"You didn't."

"Then, don't you see? I know it couldn't be my picture, or Allan wouldn't have said, 'Who is it?' Nor your mother's or sister's either, as both are well known to him. Don't you see?" she said wistfully. "Haven't you anything to say?"

"Yes, I say this." He flung his arms wide in quiet, impressive despair—"If we can't trust each other—if our first instinct is not to trust each other—if we can't build our future on each other's love and honor—had we better go on?"

"You want it to end?" she faltered with stiff lips.

Where they stood the dusk was heavy. Their faces, revealed and shrouded in the leaping and falling of the gypsy fire, were like the faces of accusing phantoms. Bob heard a sob, bitterly fought against, break from her, and in a wild way her hands sought his, crushing a ring into them.

"It is ended," she moaned.

But he held her hands fast. "Answer me first." His lips were close to hers. "Do you trust me Betty?" he whispered, with deep, penetrating tenderness. Do you believe that I love and honor you? Could I lie and cheat what I love and honor? Aren't you first with me? Wouldn't I shield you against the whole world? Aren't you my saint and my good angel as well as my sweetheart? Could I love you better than I do? Could I need you more?"

"Forgive me, forgive me," she whispered, and their lips met. All the other kisses they had given each other were humbled by this one. It was big with soul, humility and pardon—a sacrament.

They went on to the camp, hand in hand, in silence. They were on the heights that tower in some silences and from which the valley of ordinary speech must be reached deviously and slowly.

Hours later they were saying good night. Betty was standing under the lifted flap of the tent.

"Don't you want to ask me something?" Bob said.

"Perhaps you will tell me without my asking," she smiled, her eyes still penitent.

"You don't even want to know the color of her eyes."

"Nor of her hair—unless you tell me yourself."

"Well, she hasn't any hair," said Bob.

"No hair ?"

"No hair—and only one tooth—and the tooth sticks out."

"Oh,"—she clasped her head in her hands in sudden enlightenment—"it's that hideous baby picture of me. That's what you were talking to my nurse about the day she came to see me—she gave it to you. It was very nasty of her. Oh Bob," she pleaded "do give it to me dear. It's so— so plain."

"I like it," said Bob fatuously.—Lippincotts.

Examine the orchard carefully, to see if there are dead or badly diseased trees. Remove all that cannot be successfully treated and burn them to prevent spreading the disease. A little attention to this matter now may save you much trouble.

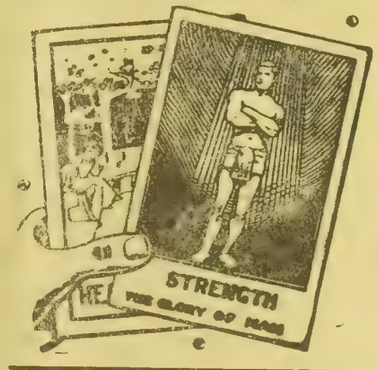
W. D. BEATH & SON, LIMITED, TORONTO.

This Man is Young at 55 Years.

He is a "Health Belt Man;", therefore has the vitality and hot, red blood of youth in his veins; he towers like a giant above the ordinary difficulties of life—be a "Health Belt Man" yourself—it gives manly Strength; it makes you young and keeps you young all the days of your life; it takes all the coward out your make-up—let me give you of this abundant vitality, then nothing can ever conquer you but death itself—100,000 men have taken my advice, why not you ?

The secret of life-long youth may be summed up in one word—Vitality. If you have this great natural power in abundance years count for nothing. I use no drugs, I recommend none Just the Health Belt. No privations, no dieting and no restrictions, excepting that all dissipation must cease. Put the Health Belt on nights when you go to bed; let it send its power into your nerves, organs and blood while you are sleeping It gives you a great flow of soft, gentle, galvano-vital electricity during the entire night. One application and you are like a new being; it takes all the pain and weakness out of your back; it makes you answer the morning greeting with "I'm feeling fine" It is a great strength builder; it overcomes the results of earlier mistakes and indiscretions; it gives you a compelling power, so that you are attractive to all women and men with whom you come in contact. Three months' use is sufficient, S Coolen, Hubbards Cove, N. S., writes: "I am a man again, thanks to you. Nothing can discourage me now." This is one among tens of thousands.

Free Until Cured. Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.



These Nature Cure Books FREE

Let me send you these books. They contain much valuable health information, are fully illustrated, describe my Health Belt. Fill in coupon or send your name and address on a postal card.

DR. M. F. SANDEN CO., 140 Yonge Street, TORONTO, Ont.
Dear Sirs—Please forward me your books as advertised free.

NAME.....

ADDRESS.....

All we ask is for you to let us buy a 50-cent bottle of Psychine (pronounced Si-keen) from your druggist and give it to you free to try.

It has only been within recent years that we have come to really know about the white corpuscles of the blood or the phagocytes and what their function is.

That they are the policemen or scavengers of the body.

Devouring every disease germ that enters the body when they are strong enough or in sufficient numbers.

Or being devoured in turn by these disease germs when inferior in strength.

It has only been within the last few years that scientists have found out that certain herbs strengthen and increase these white corpuscles, or bodily scavengers.

* * *

And these herbs largely compose Psychine.

For thirty years Psychine has been strengthening and increasing the white corpuscles of the blood.

For thirty years Psychine has been building up run-down vitality, curing many of apparently hopeless diseases.

We have sold millions of bottles of Psychine in that time.

We have cured hundreds of thousands.

And we have received hundreds of thousands of unsolicited testimonials.

All due to this marvellous power of strengthening and increasing the white corpuscles of the blood.

Here are the diseases in the treatment of which Psychine is indicated.

Here are the diseases of which Psychine has cured many thousand cases:

La Grippe	Bronchial Coughs
Bronchitis	Weak Lungs
Hemorrhages	Weak Voice
Sore Throat	Spring Weakness
Anaemia	Early Decline
Female Weakness	Catarrhal Affections
Indigestion	Catarrh of Stomach
Poor Appetite	Night Sweats
Chills and Fevers	Obstinate Coughs
Sleeplessness and	Laryngitis and
Nervous Troubles	Dyspepsia

After-effects of Pleurisy, Pneumonia and La Grippe.

Now, we don't ask you to take our word for the tremendously beneficial effect of Psychine. Fill out the coupon below, mail it to us and we'll give your druggist an order (for which we pay him the regular retail price) for a 50-cent bottle of Psychine to be given you free of cost.

We will undoubtedly buy and distribute in this manner hundreds of thousands of these 50-cent bottles of Psychine.

And we do that to show our entire confidence in this wonderful preparation.

A confidence that has been based on our 30 years' experience with this splendid preparation, with a full knowledge of the hundreds of thousands of cures it has made.

COUPON No. 77

To the Dr. T. A. SLOCUM, Ltd.
193-195 Spadina Ave., Toronto.

I accept your offer to try a 50c. bottle of Psychine (pronounced Si-keen) at your expense. I have not had a 50c. bottle of Psychine under this plan. Kindly advise my druggist to deliver this bottle to me.

My Name.....

Town.....

Street and Number.....

My Druggist's Name.....

Street and Number.....

This coupon is not good for a 50c. bottle of Psychine if presented to the druggist—it must be sent us—we will then buy the 50c. bottle of Psychine from your druggist and direct him to deliver it to you. This offer may be withdrawn at any time without notice. Send coupon to-day.

Picking Flaws.

"I really dread to show her anything I get that is new," said a young matron referring to a friend, "because she is sure to pick some flaw in it. It is sure not to be so good as something she has, or the style or color or fit won't suit her—and she always mentions it! Yet, if I don't show it, she will think it odd, and feel hurt."

There are few more irritating things than having to be closely associated with one of these chronic grumblers. Nothing, apparently ever suits them, and they are not bashful about airing their opinions.

It makes no difference whether the matter under discussion be work, or play, or some new article for the house, it isn't exactly right. In some particular, it ought to be changed, and the probability is, that even then it would not meet their views.

The habit is one that grows upon its victim, as all bad habits do, but it especially strengthens with age—indeed, the habit is frequently formed by middle-aged persons who never had such a tendency in youth. There is no habit not actually sinful which will more quickly alienate one's friends, and render "one's room better than one's company," and yet it is oft times an unconscious fault.

"But I am so outspoken. I don't believe in beating about the bush, nor lying, just to save one's feelings," these people say, when attacked on the subject.

My dear friends, nobody asked you to lie. But one can tell the truth, and nothing but the truth, and still not tell all the truth.

I may not like the colors on my friend's hat, and yet admire its shape, or I may like the trimmings and not the hat, or I may like the hat, and not like it on her.

Eow why, when she exhibits that hat, is it not as well for me to praise the things I do like about it, and keep still about the rest, unless she asks me point blank, and even then there are ways of telling the truth and saving her feelings, too.

A certain rather plain young lady was one day under discussion, and her personal appearance freely commented upon, when one of those present said, "Yes, but she has such a pretty hand!"

Now that is the spirit to cultivate—the spirit that approves instead of disapproves, the spirit of commendation.

You may not have one single opinion agreeing with your neighbor's and yet own her a good wife and mother; or you may disapprove of her character and yet concede her neat and industrious. Speak the good you know, surpress the mention of what you do not like, and you will be one of the springs of society, saving many a rough jolt to your neighbors, as that rather uncomfortable conveyance lumbers along.

These are some parents who are always picking flaws in their children. Nothing the child can do or say seems to be exactly right, and they keep up a continual fire of irriating criticism directed at the child. They may only mean to keep the child from being conceited, but a little conceit is necessary if one is to get on in life, and a child brought up in such an atmosphere is sure to run to one of two extremes. Either he will become too self-distrustful ever to take any comfort in life, or he will learn to disregard his parents entitely, and it is hard to say which is the worst.

Many persons seem to feel that they are privileged to pick flaws in their relatives to their heart's content. They make the bond of kinship an excuse for a liberty of speech they would never dream of exercising elsewhere. Doubtless the members of a family should be able to speak more freely to each other than to outsiders, but it should always be remembered that there are bounds beyond which no person on earth has a right to go, and our nearest and dearest should respect us sufficiently not to violate them.

The confirmed picker of flaws often finds herself in a curiously isolated condition. People seldom ask her opinion, or admit her into any degree of intimacy. She finds that she is seldom appointed on committees for church or organization work, her children seem to be growing away from her, somehow, and at last she finds herself standing alone, looking at the life going on about her wistfully—but picking flaws to the last. She does not realize that she has brought this state of things upon herself in the least, but blames fate for the result of her own work.

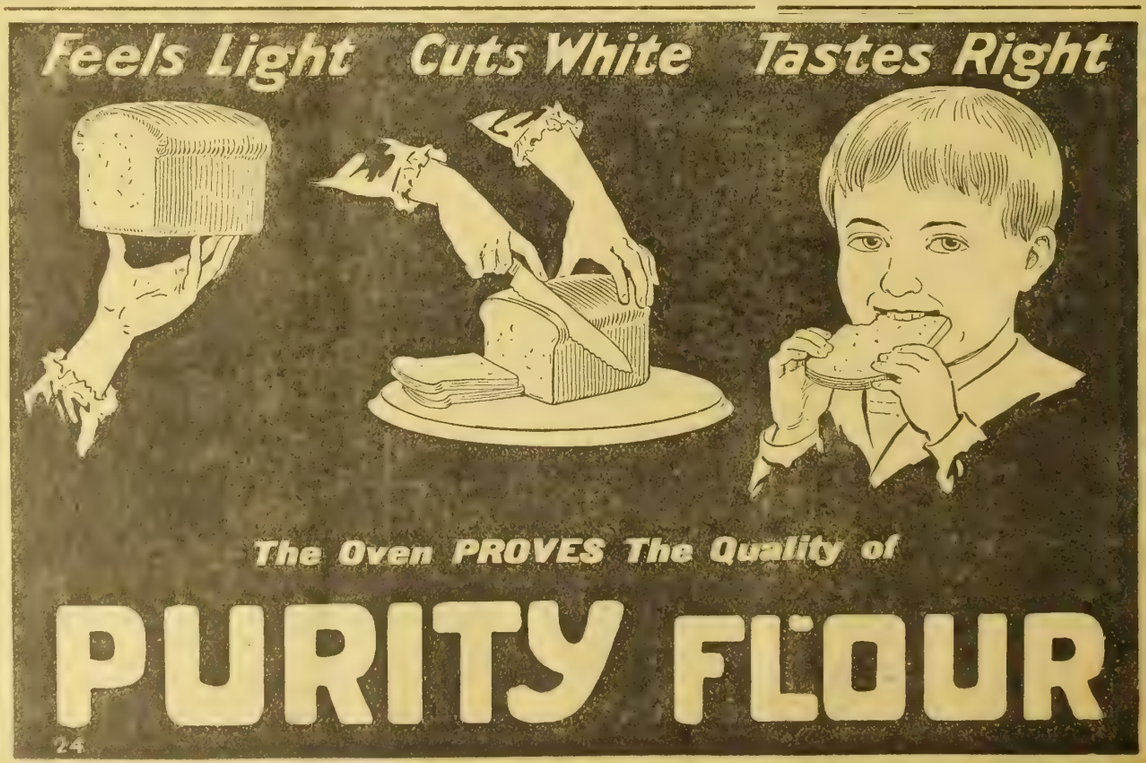
If any woman who reads this recognizes in herself the beginning of this wretched habit, she should cultivate the custom of saying nothing but good of people unless forced to do otherwise by a point blank question. When she has trained herself to discern the good as easily as she does the evil, and has brought her tongue to speak well of others and to save their feelings in every way she conscientiously can, then the back of this habit will be broken.

Nothing on earth is perfect, but we can train ourselves to close our eyes to many imperfections and ignore still more, as we search for the good and beautiful in life.—Jim's Wife.

"No"

Many of us sisters remember of reading, whenc children, how a father once said to his little son, "The hardest word in the English language to pronounce is the little word "No"

The father realized the truth of the saying, as the child could not. When a child is asked by some of



his playmates to do something he knows he ought not, or his parents would not approve, it is hard for him to say "No." He fears of giving offence if he does not accept a cigarette when one is offered him. If asked to take a glass of wine or beer, how often instead of refusing, as he knows he ought, he will take the glass and drain it. That one glass leads on to more and the final consequence is sad to relate.

It is not easy for a young lady, when walking or riding with a gentleman, to object to his smoking. It is not easy for her to say "No," but it is easy to say "Yes."

If every young lady would refuse a gentleman smoking in her presence, how much less money would be spent for cigars, cigarettes and tobacco!

The question often comes to me: Were those who drink and smoke taught, when children, to say 'No"? If they were, I cannot believe there would be so much drunkenness—so much crime. There would be more happy homes. Are we mothers doing our full duty? Are we teaching our children to have a mind of their own, and how to use it? If they learn these things at home, then when they go out into the world, amidst its temptations, it will be as easy for them to say "No" as it is to say "Yes."

Horse Sense.

If you work for a man, in heaven's name work for him.

If he pays wages that supply you your bread and butter, work for him speak well of him, stand by him, and stand by the institution he represents. I think if I worked for a man, I would work for him, I would not work for him a part of his time, but all of his time. I would give an undivided service or none

If put to a pinch, an ounce of loyalty is worth a pound of cleverness.

If you must vilify, condemn and eternally disparage, why, resign your position, and when you are outside, damn to your heart's content. But, I pray you, so long as you are a part of an institution, do not condemn it. Not that you will injure the institution—not that—but when you disparage the concern of which you are a part, you disparage yourself. And don't forget—"I forgot" won't do in business.—Elbert Hubard.

Improper Seeding.

One day a peasant carried a basket of potatoes to the field and dug holes in the soil and planted them. His young son watched operations for a time and then inquired:

"Daddy, why do you put those taters in the ground?"

"By so doing, each one will bring me back ten, my son," replied the father.

The boy went away, and when his father came up to dinner he found him digging in the yard and asked:

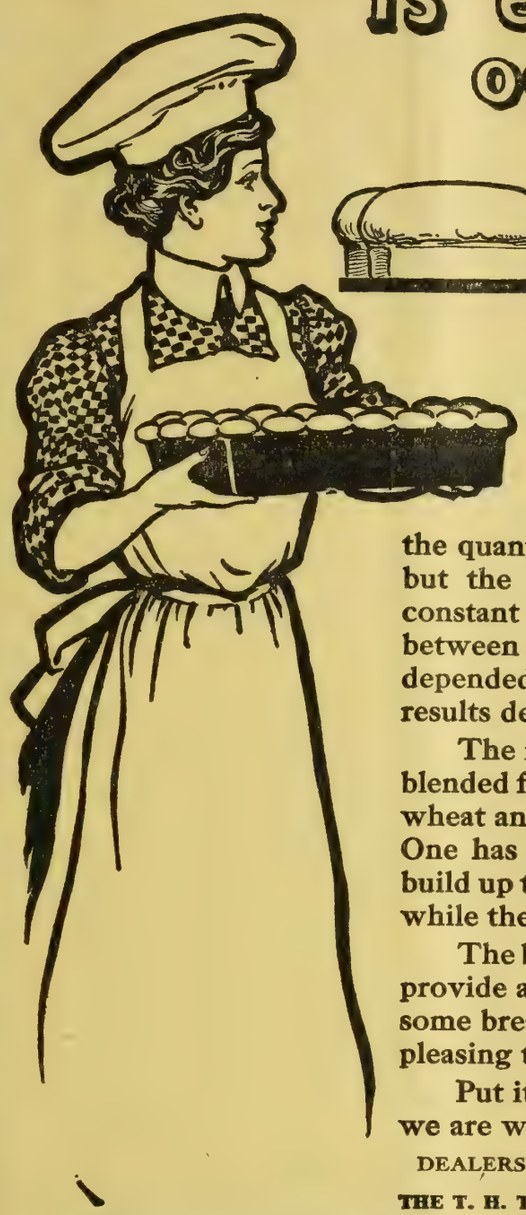
"Sonny, what are you seeking?"

"Why, daddy, I have planted the clock, two umbrellas, the teapot, your Sunday hat, ma's boots and a tablecloth, and each one will bring me back ten."

"You young idiot, come here and be skelped!" shouted the father, and he tanned the boy up and down crossways and sideways, until he was tired.

"Daddy planted taters to get back ten," mused the boy, as he sat down under the cow shed to think. "But I planted clocks and hats and boots to get a licking. It must be the difference in the soil.—Pearson's Weekly.

BEAVER FLOUR
is equal to the occasion



SOLVE THE BAKING PROBLEM

by using the flour that you can always depend upon. You've noticed how your bread or pies or cakes turn out with varying degrees of success, and you have blamed the heat of the stove, the quantities of your ingredients and anything but the right thing. The difference between constant success and uncertainty is the difference between Beaver Flour and flours that cannot be depended upon in all baking operations. Unfailing results demand the use of "BEAVER" FLOUR.

The reason is simple. Here is a flour that is blended from the rich, nutritious Manitoba Spring wheat and the more delicate Ontario Fall wheat. One has an abundance of gluten, that goes to build up the human frame with nourishing food, while the other ensures lightness and whiteness.

The blended wheat properties in Beaver Flour provide a perfect combination for making wholesome bread, biscuits, cakes and pastry that are as pleasing to the eye as they are sweet to the palate.

Put it to the severest tests you can devise, and we are willing to abide by your judgment.

Near Philosophy.

A hearty laugh at home is worth a hundred in the saloon.

Just so long as the liar tells a cheerful story he will be listened to.

There are laws and to spare. What is needed is that some of them be enforced.

A smile will do more to keep a boy on the farm than a 4.00 o'clock call to breakfast.

There are but two things that a farmer needs really dread; a mortgage and a lawsuit.

I do not believe God ever forgave the person who destroyed a young girl's character.

You can reason with a well-fed man, but a hungry stomach is not calling for logic.

It does not pay to always take the advantage when you deal with your neighbor. No sir.

Imagine the sensations of some rich men when they find the Pearly Gates sealed against them.

If you will observe closely, you will find that there is more silver in a cloud than sheet iron.

Do you know you have no moral right to look for greater honesty in others than you have yourself.

If an honest man is the noblest work of God, the Creator was not limited for time in harvesting the crop.—Old Soliddigger.

A Good Plan.

Give your boy his watch, his carriage horse, when he comes to that point. Go all the way with him. Give him also his pocket book and his bank book. Pay him a salary and let him save for his start in life himself. He will be a man. No other young fellow works in any calling in life for his board and clothes until he is 25 or 30 with the vague promise of a start in life. The chances are if he does not get it until then, he will make some life miserable for he will not know how to use it.—Aunt Faithie.

Chamberlain's Cough Remedy is not a common, every day cough mixture. It is a meritorious remedy for all the troublesome and dangerous complications resulting from cold in the head, throat, chest or lungs. Sold by all dealers.

For Burns.

I once visited an old lady who always kept a small bottle of mucilage on the kitchen self, and whenever she burned her arms or hands on the oven door, or in any way from the cooking stove (those horrid little, but aggrivating burns); she used to spread a little mucilage over the surface immediately. This soon dries on the burned spot, and keeping the air from the burn, soan stops that smarting sensation which is always so painful. Of course this remedy applies only to small or petty burns, and should in no wise be applied in case of serious burns or scalds from steam.—Miss C. B. Morse Peterboro Co., Ont.

The busiest and mightiest little thing that ever was made is Chamberlain's Stomach and Liver Tablets. They do the work whenever you require their aid. These tablets change weakness into strength, listlessness into energy, gloominess into joyousness. Their action is so gentle one don't realize they have taken a purgative. Sold by all dealers.

FLORICULTURE.

O. H., writes:—When shall I cover my bulb beds?

Hardy Roses and perennial borders now. In covering Hardy Roses bend them over from the prevailing winds, put some boughs under the stalks and cover with others. The boughs under the roses are to set as a sort of spring during heavy snows to prevent the roses breaking off.

Look at Paper White Narcissus and Roman Hyacinths in the cellar, possibly some may be ready to come to the light if pots are full of roots.

Writer, says: I have a large Sword Fern over eight years old, which, for many years, was a beauty Of late the leaves are stringy and grow twisted and there are not many of them. What can I do to bring it back to its old form?

It is hard to advise in a case like this as one becomes attached to a plant to such an extent that to destroy them appears to be a sacrilege.

Yet with a fern as old as this with all the symptoms of debility mentioned to destroy the plant and get a new smaller one is the soundest advice in the long run. You might get a short duration growth in artificial fertilizers, but it would soon go back again and be a worse wreck than ever. Better get a new plant.

A., of Digby, N. S., writes: My rose bushes are covered with a little green slug or worm that is eating the top off and leaves the skeleton of the leaves only. What should I do for them?

The rose slug is very destructive and German Hellebor should be applied at once. One spoonful to a gallon of water put on with a sprinkler while the foliage is dry, two or three times during the summer should be sufficient, but apply as soon as you see the first worm. Do not let them get a start.

W. O. N., Newcastle, writes:—Will you please advise me what to do to save a large plant of Asparagus Sprengeri that is losing all of its leaves. The new vines seem to be growing all right but the old vines are shedding all their leaves. It is a large pot and the roots are coming out of the drainage. What is the best hardy lily for the garden, that is, outside of the common yellow?

By all means repot the plant at once. This will overcome this difficulty with the foliage in a short time, but you should not allow this plant to become thoroughly pot-bound again.

For a hardy lily try the "Lilium Auratum," or Golden Band Lily of Japan. It is a beautiful flower and winter's well if protected well in the fall.

Farm Problems.

Wet or dry Mash.

Modes change and so do the methods of poultrymen, writes a practical poultryman in Wallace's Farmer. Some years ago, no man at all versed in practical poultry keeping could be found, who did not feed his warm morning mash every day, Sunday included; then some one came to the front with the suggestion that the mash was all right but that it had best be tried at night before the hens retired, as, if fed in the morning, it would make the hens huddle up in the corners and make them lazy. The labor-saving advocate came next. He installed the dry mash box, which contained either a whole grain ration or a ground grain ration augumented with charcoal, beef scrap or linseed meal, and claimed this as the only safeguard to assure a full meal to every hen. All of the above mentioned methods have some points in their favor, and all of them may have also some disadvantages. From my personal experience with all of them, and especially with the more prominent egg-laying breeds, to which Leghorns belong, I would unhesitatingly advise a good morning mash as the surest way to get the finishing touches onto your birds. Boil up meat-scraps, vegetables, such as potatoes, turnips, greens of all kinds, kitchen waste, etc., towards night, add to it one-third of each bran, cornmeal and ground barley or buckwheat, if it can be had, a little charcoal and season it with a little red pepper and salt and allow the fire to die down gradually. This mash will keep hot till morning and is right for feeding when daylight breaks. Give the hens of this all they care to eat quickly, and be sure to have ample trough accommodations, so that even the weakest of the birds has room to partake of it. Follow this up with grain in litter one hour later. Scatter some grain in the centre of the house in the litter, cover it up with litter from the sides and corners, add some more grain and keep this up until all the litter is well mixed with grain and forms a huge pile of straw in the middle of the floor. Let the hens scatter it at will. Give them plenty of green stuff at noon. Carrots, mangels or beets sliced in half, spiked on nails on a board hung on the wall or cabbage heads hung on a string for hens to jump for. One hour before dusk, feed roasted corn or wheat, preferably alternating, on the floor. If the corn is charred, it is best, because it has the best kind of charcoal ingredients. On this feed, hens must mature quickly and begin laying and keep it up. The dry mash method is a good one, as it is a surety that hens will get ample feed at all times, and as they by nature are not taking more of the dry mash than they need, over feeding is not apt to result. Where a man cannot spare the time or does not care to go to the trouble of mixing the daily wet mash, this is no doubt the second best way. But as said above, I would prefer the wet mash for every day except Sunday, and by scattering the grain in the pile of straw late on Saturday night, it would give the hens an incentive to start scratching the first thing in the morning and having missed one morning mash, give them at the same time an extra appetite for an early Monday breakfast. I do not believe that labor should be taken so much in consideration, where it comes to getting the best out of hens. Poultry profits are high or low, as our labor, graded by experience and intelligence, creates them. and to the man who is not willing to give his brain and brawn to the subject, hens will never be high-notch producers.

Sheep on the Farm.

No class of live stock on the farm are as good to enrich the ground as sheep. They scaeter the manure evenly over the pasture and results are more satisfactory than when other live stock are pastured. Of course the manure spreader does the trick with stable manure, but unquestionably sheep are the best natural spreaders in existence.

It is admitted all the world over that live stock on the farm means an addition to its fertility and the speedy improvement of land impoverished by long continued cropping. But stock on the farm is also a conserver of fertility, and the running of cows, hogs or sheep in the stubble is good business from any of the viewpoints of the sound farmer. Stable manure is the finest of all fertilizers, but the difficulty is, in the first place, to get enough of it, and, in the second, to distribute it in such a way as to give the soil a fair service, and not a patchy feeding in spots; and, more than this, it is the rule where the manure from the stable is used at all on the farm, to cart it out and let it get bone dry before it is turned under, in which case it has about the fertilizing value of so much sawdust.

The sheep is the fertilizing friend of the farmer. It returns to the soil 80 per cent. of what it consumes in the way of fertility; it will eat what other animals will refuse to touch, it is a browser and bites close; it will chew weeds and waste right down to the roots; and in new country will eat off the young shrub as fast as it makes its appearance. All the while it is engaged in this good work of fertilizing the land and putting it into condition to yield increase, the sheep is piling on wool and making mutton out of the weeds and rubbish and thereby returning to the farmer a little in each hand.

Cold Poultry Houses.

Th? Ontario Agricultural College has been making some interesting experiments regarding the effect on prolificacy of different forms of houses. Professor Graham reports that the results of these experiments so far as winter egg production is concerned, have been practically the same each season. The coldest or cheapest house, built of single-ply boards, has given the best results,

Women Who Suffer

from woman's ailments are invited to write to the names and addresses here given, for positive proof that Lydia E. Pinkham's Vegetable Compound does cure female ills.

These women are only a few of thousands of living witnesses of the power of Lydia E. Pinkham's Vegetable Compound to cure female diseases. Not one of these women ever received compensation in any form for the use of their names in this advertisement—but are willing that we should refer to them because of the good they may do other suffering women to prove that Lydia E. Pinkham's Vegetable Compound is a reliable and honest medicine, and that the statements made in our advertisements regarding its merit are the truth and nothing but the truth.

Buying A Piano Made Easy

Perhaps you are deterred from enjoying the delights of a New Scale Williams Piano in your home, by the thought of laying out several hundred dollars in a lump sum.

This is unnecessary.

By our unique plan, you gain the piano of your choice by easy payments.

New Scale Williams PIANOS

Another great advantage to those living at a distance from the large cities, is that we ship pianos on approval, guaranteeing the instruments to please or they are returnable at our expense.

Write us for details of these two selling plans—and our beautifully illustrated catalogues of New Scale Williams Pianos and Player Pianos.

THE WILLIAMS PIANO CO. Limited
OSHAWA, ONT.
109

and the warmest, built of several thicknesses of board and paper, with a four-inch dead air space between the walls, has given the poorest results each winter. The houses of intermediate type have done very well. It may be of some interest to give the eggs from five White Wyandotte sisters of the same age in each of the four houses for December, January and February:

Cold house, Dec., 43, Jan., 50, Feb., 47, total, 140; warm house, Dec., —, Jan. 23, Feb., 21, total 44; curtain-front house, Dec. 15, Jan., 50, Feb., 50, total, 115; house with adjustable window, Dec. 2, Jan., 37, Feb., 31, total, 70.

The following results were obtained in the same houses from six half sisters of the Buff Orpington breed:

Cold house, Dec. 2, Jan., 61, Feb., 87, total, 150; warm house, Dec, 22, Jan., 46, Feb., 63, total, 131; curtain-front house, Dec., 23, Jan., 34, Feb., 60, total, 117; house with adjustable window, Dec., 52., Jan., 58, Feb., 63, total, 173.

Coughing Colts.

A. J. C., P. H., N. S.:—I have two colts, nearly three years old, that took a cough about three months ago. They still have the cough although I have tried several horse powders, tar and oil of tar. What can I do for them? They are in good condition and seem to feel well. My other horses had a cough for three or four weeks but got better after being fed a little soft feed.

Ans.—A cough is a symptom in several diseases, but it is not itself a disease. It is usually present during the early stages of catarrhal afflictions. There are several varieties of cough such as moist, dry, hollow, etc., all of which assist in diagnosing the disease.

A cough does not only arise from direct irritation of the air passages, lungs and plura, but is frequently present in cases of indigestion, disease of the liver, worms in the intestinal canal, broken wind heaves, and irritation from teething, detal cough, in such cases it is due to a reflex nervous irritation. The proper treatment for cough is to ascertain the disease of which it is a symptom, cure the disease and the cough will cease.

Your colts are at an age when dentition is taking place, some teeth are being shed and replaced while others are appearing. Therefore, I assume the cough is due to dentition irritation and will advise treatment accordinglyf

Have your stable free from drafts, well ventilated and well lighted and clean. Give exercise in the open at least once, preferably twice a day, the exercise to be carefully regulated, not such as to cause excessive perspiration. Feed sufficient, but not too much, nutritious food to be given three times a day, with several hours between each feed, during which the animal cannot acquire food. A good food would be early cut, well cured hay, crushed oats, wheat bran, ground linseed and roots. The oats, bran and flaxseed to be given as a warm mash once a day and oats and bran, dry, twice a day, with a small quantity of roots once daily. Pure cold, water should be given when desired, at least three times daily. Give in food night and morning, from one to two drams of Chlorate of Potash, one-half to one dram of powdered Nux Vomica and from two to four drams of ground ginger. The quantity of the drugs as well as food to be regulated by size of colt. Apply a small quantity of liniment made by mixing four ounces each of raw linseed oil, Oil of Turpentine and Liquor Ammonia Fort, to be rubbed well in from the base of one ear to the other, around the throat and between the lower jaws and down the Trachea, wind pipe, two or three inches. Apply this treatment twice a day until blistered, then cease.

J. STANDISH, V. S.

Nova Scotia Farmers Association

The Fifteenth Annual Convention will be held at

WINDSOR, N. S.

Tuesday, Wednesday, Thursday, January 24, 25, 26, 1911.

The first session opening at 7.30 p. m. Tuesday, and there will be three sessions on Wednesday and Thursday.

Agricultural Societies and County Farmers Associations are cordially invited to send delegates, and those attending, should purchase through First-Class one way tickets to Windsor and ask agent at starting point for a Standard Certificate, which when signed by me will entitle holder to free return ticket.

Including important business the usual interesting program of addresses and discussions will be carried out.

CHAS. R. B. BRYAN,
Sec.-Treas., Durham, N. S.

POTASH

Is Absolutely Essential to the Successful Production of all

Farm, Garden and Orchard Crops.

It is quite futile to hope and pray for better crops than you had last year, while you do nothing to restore or maintain the fertility of your soil. You've got to do something to make conditions for plant growth as favorable as possible, before you can expect maximum returns from your farm. POTASH is an Indispensable Plant Food and has No Substitute. It is obtainable in the highly concentrated forms of

Muriate of Potash and Sulphate of Potash

of all leading Fertilizer Dealers and Seedsmen.

Write us for Free Copies of our Bulletins, which include:

Artificial Fertilizers: Their Nature and Use;

Records of Fertilizer Experiments in Canada;

The Farmer's Companion, etc., etc.

That Red Rose Tea is of surpassing quality is accepted everywhere it is used as an undisputed fact, but it is in the Maritime Provinces especially that it has by unvarying goodness so well earned the term "is good tea." 61

RED ROSE TEA "is good tea"

Prices: 30c., 35c., 40c., 50c. and 60c.

Stop Taking Drugs

They Are Poisonous to Your Stomach, Nerves and Vitals

Ever since you can remember you have understood that the way to cure a pain outside was to take something inside That is the foundation of our Canadian drug habit. Since childhood you have depended on drugs to kill pain. It never occurred to you that the drug was also killing the nerves of the stomach and over-taxing the heart. That is the reason for your stomach trouble. You have ruined your stomach with strong drugs and weakened your heart action by driving it beyond its strength with heart stimulants.

You can put on extra fire and draught in the furnace and drive up an engine at top speed without hurting the engine, but you can't do that very often with your heart because it is not made of iron.

You don't realize that until your heart refuses to be forced any more—that it is the time when drugs, which "used to do the work right away," don't seem to have any more effect and you are forced to realize your health is gone.

Every time you take a drug to force the stomach, liver, kidneys or heart you hurt them—you actually lessen their natural vitality—and taking another, because they are weakened by each dose, and anyone can see that in time, by steady dosing, you will have no natural action of any of these organs. From that time on your existence will depend upon forced stimulation, and when that fails you are gone.

Electricity is a relief from the old habit—the drug habit. It does by natural means what you expect drugs to do by unnatural means. It gives real strength to your body, and when your body has its natural strength there can't be any trouble, can't be any pain, because there is no pain in a perfectly healthy body. The exhilarating sensation is felt without sting or burn, and I have perfected it with the regulating device which makes the current mild or strong at will.

My Electric Belt does wonders in a few applications. It arouses all the dormant energies, develops muscular and nerve life, and restores the feelings of youth, courage and vigor. It makes perfect men of the weakest, puniest specimens of half-men.

Dear Sir,—I have worn your Belt for thirty days, and I am feeling fine, the best I have for years. My stomach is very much better, and my appetite has improved wonderfully. I can now eat a good meal and be satisfied, which I could not do before. I feel like a new man entirely. — FRED. J. CUTTERBUCK, Brockville, Ont.

Dear Sir, — I am pleased to be able to tell you that I now feel like a new man in every way. Wishing you all the success that you deserve, in your endeavor to relieve suffering humanity, I remain,

F. A. OUELLET,
Springfield, N.S.

HORSES.— Drafters, $150.00 to $225.00; Roadsters, $150.00 to $225.00; Carriage, $150.00 to $225.00.

DAIRY PRODUCTS.—Creamery Butter, 24c to 24½c, solid, ½ to 1c more for pts.; Dairy Butter, 19c to 21c.

POULTRY AND POULTRY PRODUCTS.—Eggs, 25c to 27c for shipping; locally, new laid selling 30c to 35c; Fowl, 9c to 10c; Chickens, 10c to 14c; Ducks, 13c to 15c; Geese, 14c; Turkeys, 10c to 23c.

FRUIT.—Apples, $2.50 to $4.50 per bbl.

VEGETABLES.—Potatoes, 50c per bushel.

MISCELLANEOUS.—Hay, $7.50 to $8.50; Straw, $5.00 to $6.00; Beef Hides, 8c to 8½c; Sheep Skins, 50c to 70c; Lamb Skins, 50c to 65c.

Navigation having closed for the season all freight is now going forward by the government winter boats. They are making regular daily trips from here to Pictou and are keeping the freight all cleaned up. There is not much produce crossing except fresh meats and fish, ordinary way freight and a few tons of oats. The market for all lines of farm produce is quiet and steady, the supply coming forward is limited on account of the condition of the roads. Oats is quiet and sufficient in stock for present requirements. Hay is dull as there is no chance for shipping it as present prices are easy and likely to remain so. Beef is easy, and strictly first class staff is scarcely obtainable but fair quality in good supply at reasonable prices. Lamb and Mutton are reported scarce. Poultry is easier and with small offerings the market is steady. Butter is quiet and the prices about the same as last quotation and there is sufficient offering for the demand. Eggs are scarce and prices firm and our quotations are merely nominal. Vegetables are not being offered except a few potatoes, which find a ready sale at 50c to the retail stores.

St. John Prices.

GRAIN.—Oats,, wholesale, 45c, retail, 50c; Buckwheat, $2.25, $2.50.

FEED STUFFS.—Bran, 621.00 per ton.

LIVE STOCK.—Butcher's Cattle, $8.00 to $10.00; Milch Cows, $40.00 to $50.00; Sheep, 10c; Lambs, 12c to 13c per lb.; Hogs, 9c per lb.

DRESSED MEATS.—Beef, carcass, 6c to 9c; Beef, retail, 10c to 18c; Mutton, 9c; Veal, 8c to 10c; Lamb, 12c; Pork, 8c to 9½c.

HORSES.—Drafters, $200.00 to $225.00; Roadsters, $195.00; Carriage, $175.00 to $200.00

DAIRY PRODUCTS.—Creamery Butter, 24c to 26c; Dairy Butter, 20c to 25c; Cheeses, 12c to 13c per lb.

POULTRY AND POULTRY PRODUCTS.—Eggs, fresh, 10c; cased, 32c; Fowl, 80c to $1.25; Chickens, 80c to $1.25; Ducks, $1.00 to $1.50; Geese, $1.25 to $1.50; Turkeys, 25c per lb.

FRUIT.—Apples, $3.00 to $5.00; Cranberries, $11.00 to $12.00 per bbl.; Maple Products, per bottle, 25c.

VEGETABLES.—Carrots, $1.25; Potatoes, $1.50 to 1.75; Turnips, 90c; Beets, 95c to $1.00.

MISCELLANEOUS.—Hay, $10.00 to $12.00; Straw, $8.00 per ton; Beef Hides, 9c; Calf Skins, 15c; Sheep Skins 25c to 75c.

The market is very poorly supplied with all kinds of poultry and vegetables A poor lot of beef from the Province of New Brunswick is offering. There is some beef from the Province of Ontario which shows up in good shape. The hay market is well supplied with Carleton County hay. Good butter is in good demand in small tubs and one pound prints.

Halifax Prices.

With respect to feeds, there is a fair local consumption. Supplies have been fairly free, except in bran, in which there is a shortage. Oats are firmer than they were, but the market is unchanged. The hay situation continues as before.

Peas, 4.75 to 6.00; Oatmeal, Standard, in bbls, $5.20 to $5.30; Oatmeal Standard in bags, 5.00 to 5.10; Rolled Oats, in bbls., 4.75 to 4.80; Rolled Oats, in bags, 4.50 to 4.60; Middlings, 25.00 to 26.00 per ton; Bran, 22.00 to 22.50 per ton; Shorts, 24.00 to 24.50 per ton; Feed Flour, bag 98 lbs., 1.70 to 1.75; Cornmeal in barrels, 2.95 to 3.00; Cornmeal in bags, 1.40 to 1.42½; Feed Oats, in bags .47 to .48; Hay 10.00 to 12.00 per ton.

Predictions are made that provision prices, and particularly beef prices, will be higher. The general tone of the market is much firmer than it was, the declines having been very largely recovered. Beef prices at packing points are 75 cents to a dollar a barrel higher than a few weeks ago, with the tendency still upward, and all grades of pork are a dollar a barrel higher at packing points.

PORK.—American Clear Fat Backs, $26.50; P. E. I. Mess, 24.50; P. E. I. Short Cut Backs, 26.00; American Bean, 23.00; Rumps, none; Jowls, 14.75; Pigs Feet, .50. Hams, .17; Roll Bacon, .14; Side Bacon, .18; Lard in Pails, .15; Lard in Cases, .16.

BEEF.—American, 19.50; Best Canadian, 20.50; ½ Bbls. Pork and Beef, 50c. extra.

BUTTER, CHEESE AND EGGS.—There has been a largely increased make of butter and cheese throughout the Maritime Provinces during the past year, as compared with the previous year, and there has been very much less butter imported into Nova Scotia from the Upper Provinces than usual. This is an encouraging feature and it is to be hoped that this increased production will continue to develop as new markets can be found for the product. The factorymen are also showing a better disposition to pack their product in special packages to suit the requirements of the several markets, and this co-operation is very necessary in order that the trade may be secured. Ample stocks of eggs are now available for all requirements. A few new laid eggs are finding their way to market.

Creamery Prints, 28c to 29c per lb.; creamery solids, 26c to 27c lb.; Dairy Solids, 23c to 24c per lb.; Dairy Rolls, 24c lb.; Cheese, twins, 13c lb.; Cheese, large, 12½c lb.; Storage Eggs, 27c per doz.; Selected Eggs, 30c per dozen.

FRESH FRUITS AND VEGETABLES.—As usual in the first part of January trade in this department is a little quiet. Apples are about the same as they have been for some time past, ranging from $2.25 to $4.50 per barrel. In vegetables the principal item of interst is potatoes. Talking with a well-posted member of the trade the other day, he confessed he did not know what to make of the situation and would not be surprised whichever way the market went. There were conflicting opinions about the probable course of the market, but he thought his mind would be cleared on the situation soon, as whatever change there would be, up or down, would probably come in another fortnight.

Valencia Onions, 4's per lb., .02½; Valencia Onions, per lb., .02¾; American Onions, per lb., .02½; Canadian Onions, 75 lb. bags, 1.40; Lettuce, per doz. heads, 60c; Cucumbers, each, 20c; Cabbage, per doz., 1.00; Turnips, per bag, 1.00; Beets, per bbl., 1.50; Carrots, per bbl., 1.50; Cauliflower, per doz, 1.25; Potatoes, P. E. I., per bag, 1.25; Potatoes, N. S., per bag, 1.25; Apples, per bbl. 2.25 to 4.50; Parsnips, per bbl., 1.50; Cape Cod Cranberries, per bbl., 10.00 to 12.50; N. S. Cranberries, 9.00.

FRESH MEATS AND POULTRY.—Fowl, per lb., 12c; Turkey, per lb., per pair, 70c to 1.00; Geese, per lb., 16c to 18c; Ducks, per lb., 15c to 18c; Beef, per lb., 9c to 10c; Mutton, per lb., 7c to 8c; Veal, per lb., 7c to 8c; Pork, 8c to 9c.; Blue Wing Duck, per pair, 60c; Rabbits, 24c; Lamb, uer lb., 10c to 12c; Chicvens bits, per pair, 10c to 15c.

Correction.

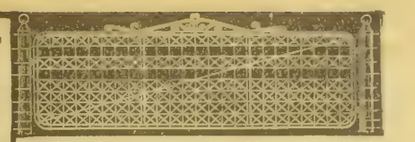
In our issue of December 20th, in which a partial list of the winners at the big Amherst Poultry Show was given the first and second prizes in Class 120, Section 9 and 10, pair Barred Plymouth Rock cockerels and pair Barred Plymouth Rock Pullets, respectively, were inadvertedly credited to Wm. Cowlings, Moncton. The Rhodes Silver Cup for the best two cockerels and best two pullets was credited to Earl T. Roach, Amherst. All these prizes should have been credited to Craig Bros., Amherst, N. S., who claim to have held first place in Eastern Canada, in breeding Barred Rocks, for the last ten years and can prove it by their winnings.

At any great poultry show the coveted prize is 1st cockerel and this Craig Bros. have captured two years in succession and not only did they get first this year, but also 2nd, 3rd and 4th cockerels, a clean sweep. The second prize went to a patron of their's but the bird was their stock and they have the liberty to publish the fact. They also had second cock, 2nd and 3rd hens and 3rd pullet, so that in the face of such strong competition as they had at Amherst, when one sums up their winnings, it is found that their's is not an empty boast. The credit for first and second prize on Live Utility pairs of Barred Plymouth Rock Cockerels and pullets belongd to Craig Bros., and with the above mentioned pairs they were succestful in capturing the Silver Cup donated by E. N. Rhodes, Amherst, for the best two corkerels and best two pullets in the Live Utility Class.

The electrically-welded, solid-piece frame gives strength and stiffness to

Peerless Farm and Ornamental Gates

We build Peerless Gates to last a lifetime—handy, convenient and attractive. They remain staunch and rigid through all kinds of rough usage. The frame is



made of heavy steel tubing electrically welded into one solid piece. The Peerless Gate, like the Peerless Fence, saves expense because it never needs repairs. We also make poultry, lawn and farm fences of exceptional strength. Write for free book.

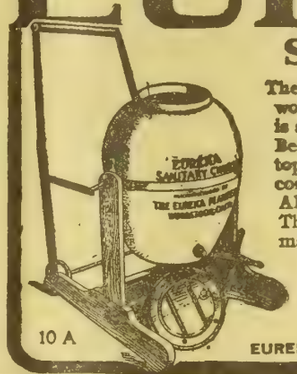
EUREKA
SANITARY CHURN



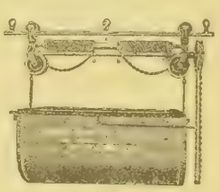
10 A

There's no comparison between the ordinary wooden churn and the "EUREKA". Barrel is stoneware—top is clear glass.
Besides being absolutely sanitary, the glass top enables you to see how the churning is coming along without opening the churn.
Also made with Aluminum top.
The "EUREKA" is the easiest churn on the market to operate. By tilting back the frame until the weight rests on the wheels, the churn can be quickly and easily moved—while the barrel remain upright.
If your dealer does not handle the "EUREKA," do not take a substitute but write us for catalogue.
EUREKA PLANTER CO. LIMITED, WOODSTOCK, ONT.

A SOUVENIR.

A satisfied customer writes:

"Your litter carrier works to perfection. I have hung up my wheel barrow as a souvenir." We get lots of letters like that. Hang up your wheel barrow and use a litter carrier.



Send us a rough plan of your barn and we will furnish you with an estimate of the cost of an outfit.

LOUDEN MACHINERY CO.

Manufacturers of Hay Tools, Litter Carriers, Barn Door Hangers, Cow Stalls Stanchions, etc.

Use A Machine.

We believe that the farmer has not done and is not doing his whole duty to himself and to his family so long as he has not made the labor of operating the farm as light as possible, as convenient aod profitable as it can be made with the smallest amount of arduous effort. One of the means for making farm labor less arduous and at the same time more profitable, is the use of improved farm machinery. With the proper equipment, the work on the farm will not only be lightened as far as hard manual labor is concerned, but a great deal more labor can be accomplished without the hiring of additional help. This, in these days of the scarcity of farm laborers, is a most important consideration.

Consider, for instance, the problem which confronts a farmer with one man to help him when he comes to the harvesting of ninety or a hundred tons of hay at a time when it is impossible to secure extra men, and perhaps, also extra horses, at just the time when he wants them—just the time when his hay ought to be put into the barn in the smallest possible number of days. It is such things as these that make the farmer's life hard and his working day long and wearisome—if he has not a sufficient equipment of machinery—and his expenses large if he hires the men and teams to do the work in the time in which it ought to be done.

But with the machines the farmer with his one hired man, his regular man, or with his son, if he is so fortunate, is or can be absolutely independent, as independent as the proverbial independence of the farmer, or even if he has as big a crop as that we suggested above. And if it came to the pinch, the one-man farmer, with the aid of a daughter or his wife, could do more with the proper kind of machinery than three men and as many horses under ordinary conditions.

Among the machines which are responsible for this condition of affairs on the modern farm is the hay loader, which we have often been surprised to find no more in use than it is on the ordinary sized farms. Of course there are undoubtedly hay loaders, and then there are other hay loaders, and some of them perhaps would not be of much use on the ordinary small farm. But there are others which are fitted to the most unfavorable conditions to be found even on the rocky hill farms. We are willing to acknowledge that we are something of a crank on this subject, but every farmer will acknowledge that the subject of farm help is an important one, and anything that will help to solve the problem is worth being a crank about. Especially are we a crank about the hay loader question, for it seems a pity that so much hard work should be done by the strength of a man's arms and his back when it can as well be done by an unfeeling machine. It seems a pity that so much good hay should be damaged or spoiled because it cannot be harvested in time, when, with a hay loader, it could be easily be put into the barn in time to preserve its greatest value.

We have heard it stated that a hay loader is a cumbersome and heavy machine, requiring an extra team of horses, and also making necessary a side delivery rake, but that also depends upon the kind of a loader.

We confess to a fondness for quoting the case of two ordinary men, with two less than ordinary farm horses, who in twelve days harvested close to a hundred tons of hay from forty-five acres, the machinery which they useh being one mowing machine, a tedder for a part of the crop, and a hay loader, with a horse rake for some raking after. Of course the barns were equipped with unloading apparatus, and in one of them the apparatus was operated with a gasoline engine. None of the hay was raked before being loaded, and it varied from heavy timothy and clover to a light red-top. One pair of horses did all of the work except on the last half day, when an extra team hauled a few loads into the barn. How long think you, it would take two men and a team to load, haul to the barn and unload, that amount of hay by the ordinary method; allowing even a horse hay fork for unloading? There wouldn't be much time left for mowing in two weeks, to say nothing about tedding and raking and the raking after.

We have had something to say along this line before, but do not think we ought to refrain from speaking of it again, for the season af the year is here when the wise farmer is thinking of the purchase of new or additional machinery for next year if he thinks he is likely to need any. The riding plow is another great labor saver if a man has any large fields, as is also the riding cultivator. There are a good many of them in use, but there are also a good many men who are still technically clod-hoppers when it comes to the working of the soil. Hundreds of farmers, and not large farmers, either, by any manner of means, are finding a gasoline engine a great labor saver and also a great profit maker. In these days of advanced farming, it is not a question of whether a farmer can afford a machine or not; the question is, can he afford to do or try to do without it.—Maine Farmer.

Potato Growing.

Editor Maritime Farmer:—

In your issue of December 6th, I read a lengthy article concerning Mr. C. Fred Fawcett's achievements, and as potato growing seems to be his speciality I would like some information from him on the following questions :—

1. How does he prepare his soil for potato growing?
2. How does he prepare his seed?

A DAIRYMAN'S PROBLEM SOLVED.

Read what a Dairyman, who used Blatchford's Calf Meal, says:

Digby, N. S., Aug. 10th, 1910

MESSRS. A. A. ARCHIBALD CO., Truro, N. S.

GENTLEMEN :—I have been feeding Blatchford's Calf Meal for about three years, with great success. In June, 1909, I commenced feeding Calf Meal to a bull calf, and killed same in Nov of same year. This calf was, without doubt, the best one I ever raised; when dressed it weighed 260 lbs., being 4½ months old. The pelt of calf weighed 42 lbs., which was an exceptional heavy weight. I have recommended Calf Meal to a number of my neighbors and they are using it now with good results. I take great pleasure in recommending it. (Signed)

GEORGE S. NICKERSON,
Brighton, Digby Co., N. S.

MOST dairymen are tempted to sell all the milk that they can produce. It may not be the best for them to do so, but when bills have to be met, something must be done, otherwise embarrassment for the time being often stares them in the face. We believe they all realize the importance of raising the young heifers and bulls, but you know how it is, things must be arranged temporarily at least, it is impossible to give calves the milk. This is something that institute speakers overlook, nevertheless it is an actual condition that must be met somehow. There was a time when one could go out in the back districts and get new milch cows, but that day has gone, too. How to get calves to maturity without milk is the problem. We have solved it for you, but unless we can tell you more about it and unless you will have confidence enough in what we have to suggest, you should not read another line. Our

Blatchford's Calf Meal

is not a tonic, a patent medicine or an offal from a large manufacturing plant. It is a substitute for milk and **will** make bone, flesh, fat and muscles, etc. It is not only the best, but it has stood the test. We have been manufacturing it for a longer time than any of the other supposed calf foods.

We thoroughly understand dairy conditions in the Maritime Provinces and have given your conditions a great deal of attention. We know what you want and so do you, but unless you give Blatchford's Calf Meal a trial, you will still be without what you want. Nothing short of a trial will convince.

Let us assist you in your business. We can do it. Write today for catalogue.

Neary's Horse Liniment

Once Used—Always Used Don't be Without It **FOR MAN AND BEAST** **One Ounce—1-3 of a Bottle May Save Your Horse**

For Animal Use, Barb Wire Cuts, Old Sores, Scratches, Cracked Heel, Quarter Cracks, Saddle Galls, Sore Shoulders, Rusty Nails, Thrush, all Flesh Wounds.

ASK YOUR DEALER FOR IT.
Nothing like it. Don't take "just as good."

The Developer of Gordon Sim 2,20½, Warren Guy 2,12¾, Border 2,11½, and Eleven Others in the Thirty List.

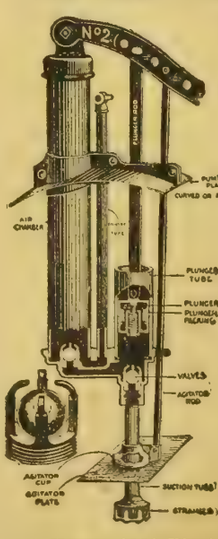
H. C. Lydiard, of Steam Mill Village, Cornwallis, N. S.:

"I have used Neary's Liniment for the past fifteen years, for cuts, bruises and sprains on horses, and have found it to be the best Liniment that I have ever used, and I have used all the different kinds of Horse Liniment to be found in this country; excellent for human flesh also."

Manufactured by NEARY LINIMENT CO., **W. W. Rockwell, Proprietor, KENTVILLE, NOVA SCOTIA**

Sold Wholesale by Manufacturers or National Drug & Chemical Co. of Canada

With HAND SPRAMOTORS.



Mr. Leigh, Supt., put 40 tons (80 000 lbs) of Cold Water Paint on the N.Y.C. Stock Yards, Buffalo, N.Y. When these wonderful Hand Machines give such excellent satisfaction for big jobs, don't you believe they will do your work well? The Spramotor is guaranteed. In all sizes, for Painting, Whitewashing, Vineyard, Weed Destruction, Orchards and Row Crops. Tell us what you want the Spramotor for, and we will send you an interesting booklet of 88 pages.

W.C. Heard, 1380 King St. London, Can.

Advertise in the Maritime Farmer.

Some growers cut their sets rather large. Does Mr. Fawcett recommend more than one eye to a set?

3. What kind of fertilizer does he use?

4. How much seed does he plant per acre?

5. Where can I procure a sample of the prolific oats mentioned in the write-up?

LEWIS A. GREEN.

Cumberland Co.

Ans. We are gald to note that at least one subscriber was interested enough in Mr. Fawcett's achievements to inquire how he was accomplishing such good results. We forwarded the above questions to Mr. Fawcett and following are his replies:

1. In making a start to raise potatoes on green sward, we like to plow fairly deep, four inches at least, so as to give lots of loose soil to cover our rows. The spring plowing seems to give me excellent satisfaction, but I would have no objection whatever to late fall plowing. As different kinds of soil require different kinds of treatment, I may state that my replies have reference to a sandy loam soil with a gravelly subsoil. We, of course, use a potato planter and can confidently say that the machine does perfect work at a minimum cost. However, to use a planter lengthwise of the furrows, it is necessary to thoroughly harrow the land, at least twice, crosswise, preferably with a disc harrow. After harrowing both ways, until done—my rule for this is to dig with my foot crosswise the furrows and if I do not find any hard lumps, I consider the field ready for the planter. It takes a man to drive the team when harrowing. A good plan is to take an ordinary spike-tooth harrow with a plank across the top on which the driver may stand while the operation is going on. This is hard on the team but it certainly does the job in good shape. I want the field just as as level as it is possible to get it before planting and to get it this way I drive the levelling harrow in whatever direction it is most needed. I would rather defer planting a whole day than to put the seed in ill-prepared soil.

2. For ordinary field work I prefer good-sized sets covered well with land plaster. Potatoes that halve, quarter or third seem very desirable for seed purposes, in a great many potato growing districts. I hardly ever look for eyes when cutting sets, but try to split the seed end. Most excellent results can be had from selecting and planting whole round potatoes.

3. I use commercial fertilizers of the very best grade, made especially fot potatoes. It is guaranteed to contain 4 per cent. Ammonia, 8 per cent. Phosphoric Acid and 10 per cent. Potash. It can be procured from local fertilizer dealers.

4. The size of sets makes some difference as to quantity of seed required per acre, but with sets fourteen inches apart somewhere between four and one-half to five barrels will be required when rows are about thirty inches apart.

Editor's Note:—We presume Mr. Fawcett will have some Early Blossom Oats, the variety mentioned in the write-up, for sale.

Improving Marsh Lands.

Rditor Maritime Farmer:

On looking over my Maritime Farmer of December 6th, I noticed your invitation to all farmer readers to express their views, in the Farmer, on topics of general agricultural interest.

In compliance with your invitation I am making my first attempt at writing for the press. I live on the north shore of the Cobequid Bay, and after years of close observation I have come to the conclusion that the greater portion of the marsh lands along the shore does not receive the attention from their owners that they deserve, or, in other words in many instances these areas could be made, by a little extra labor, to double the value of the hay crop that they yield under existing conditions.

I am going to tell my experience with one acre of marsh land, there are hundreds of acres that could be similarly treated. I had a plot containing about four acres, the lowest part of which was covered with water for the greater part of the winter and until the first of May. From the acre referred to, I used to cut each year about eight to ten hundred weight of a mixture of broad leaf, wire grass, goose grass, flat-grass and cranberry vines.

About five years ago I commenced ditching the lowest part, where the water stood. I cut the ditches about three feet through the high marsh to an adjoining creek. It remained in this way for two years, when I thought it was ready to plow, so in the fall of 1907, I plowed one acre. It is a part of one of the oldest marshes on the shore and I suppose it is over one hundred years since it was dyked. I opened up the drains again and covered the cross ditches and the side drains where they had caved in most. The sod containing the roots of the grasses already referred to was very hard to turn over but we plowed it from six to eight inches deep. In the spring of 1908, I did not get it seeded until the 22nd of June, as the spring months were very wet. I spent one and one-half days with a team of horses, disc harrow and spring-tooth harrow before I got the roots all on top and the soil fit for seeding. I seeded with oats and a good seeding of timothy and alsike clover seed, using an application of about 800 pounds, 18 per cent. Basic Slag.

A dry spell of weather set in after the land was seeded and the oats were a long time before they got a good start of growth. I cut them for green fodder about the 20th of September, and got two large two-horse loads, at that time they had grown in some places, to the height of six feet. The average height would be about four feet. I did not allow any animals on this plot to eat the aftergrass which showed a fairly good catch.

The grass was rather slow in starting in the spring of 1909 and seemed to be rather thin, but what it lacked in thickness it made up in height. Owing to wet weather I did not get the 1909 crop cut until nearly all the seed had fallen off but I got a cutting of about two and one-quarter tons. The seed that fell off the hay made a splendid catch in the season of 1910 and on the 20th of last July I cut a crop of two and one-half tons of No. 1 timothy. Later in the fall, the aftermath came up beautifully and in some places it was ten inches high. I look for even a better crop in 1911.

I have yet to solve the problem of the proper way to cover the ditches. I would like if some of the Maritime Farmer readers would give their experiences with tiles in marsh lands.

I am fully convinced that there are large tracts of marsh in Colchester and Cumberland counties, that are now producing only a little slough hay that would, with a successful system of drainage, a light application of commercial fertilizers and protected from the depredations of grazing stock, be made to yield large crops of No. 1 timothy hay.
